At the eve of a war with France, and a war with Spain in no very diſtant proſpect, two different lines of conduct now obviouſly preſented themſelves: either, firſt, to withdraw our fleets and armies from America, and to direct the whole force of the empire againſt the houſe of Bourbon, in the hope of ſucceſs ſo deciſive, as to enable us in the reſult to conclude an advantageous accommodation with America, conformably to the general ideas of lord Chatham; or, ſecondly, which would have been infinitely the wiſer, though the leſs ſplendid plan, at once to recognize, upon a principle of mutual amity, the independency of America, which would have opened the way, without difficulty, to an immediate and general pacification. But our affairs ſeemed as yet too proſperous in the opinion of miniſtry to juſtify ſuch a ſacrifice; and the North-American continent continued to be the theatre of bloodſhed, rapine, diſcord, and deſolation; families deſtroying kindred families, and Engliſhmen and their offſpring planting the ſword in each others breaſts; while the natural foe of both hovered on the coaſts, anxious to aſſiſt and promote the ſelf-deſtruction of an empire, which it could otherwiſe never hope to ſubdue.

From this fatal ſcene of unnatural warfare in America, the particulars of which we have already referred the reader to in our firſt volume, p. 439, &c. it will be expedient to advert to the ſituation of affairs in Europe. When a war with France became inevitable, admiral Keppel, an officer of diſtinguiſhed reputation, but wholly unconnected with the miniſtry, was, on the perſonal ſolicitation of the king, prevailed on to accept the command of the channel fleet, though, as he himſelf obſerved, "his forty years ſervices were not marked by any favour from the crown, except that of its confidence in the hour of danger." On the 13th of June, 1778, the admiral ſailed from St. Helen's with twenty ſhips of the line, and at the entrance of the bay of Biſcay he fell in with the Licorne and the Belle Poule, two French frigates. Through that feebleneſs and indeciſion of counſels which prevailed at this period, the admiral had no poſitive orders as to the commiſſion or avoidance of actual hoſtilities, but was inveſted with an unmeaning, and as to himſelf dangerous, diſcretion of acting according to circumſtances. Perceiving the frigates intent on taking an accurate ſurvey of his fleet, he thought it expedient to fire a gun in order to compel them to bring to; and on their refuſal to obey, a chace enſued, when the Licorne, after wantonly diſcharging a whole broadſide, ſtruck to the America, of ſeventy-four guns. The Belle Poule, after a warm engagement with the Arethuſa, eſcaped by running on-ſhore. The Pallas alſo, another French frigate, was in the mean time captured and detained. From the papers found on-board theſe frigates, the admiral diſcovered, to his inexpreſſible aſtoniſhment, that the French fleet, lying in Breſt-water, amounted to no leſs than thirty-two ſail of the line; he was therefore under the immediate neceſſity of returning to port for a reinforcement.

On the 9th of July, he was enabled again to ſail with twenty-four ſhips, and was ſoon afterwards joined by ſix more. In a few days he came in ſight of the French fleet, commanded by M. d'Orvilliers, who ſeemed, on perceiving the Engliſh fleet nearly equal in force, inclined to avoid an engagement; but the wind changing ſome points in favour of the Engliſh, they gained ſo much upon the enemy, that an engagement became inevitable, and the French ranging in order of battle, but on the oppoſite tack, the fleets paſſed each other about noon in a diagonal direction. The action, though very warm, was conſequently partial; but the Engliſh admiral, having in a ſhort time ſufficiently repaired his damages, made the proper ſignals for the van and rear diviſions to take their reſpective ſtations. This order was inſtantly obeyed by ſir Robert Harland, of the van; but admiral ſir Hugh Palliſer, of the rear or blue diviſion, who had fallen a great way to leeward, took no notice whatever of the ſignals. Admiral Keppel, after waiting perhaps too long, ſent the Fox frigate at five o'clock with peremptory directions to ſir Hugh Palliſer, to bear down into his wake in order to renew the engagement. Sir Hugh anſwered, "that he was knotting and ſplicing, but would obey the order as ſoon as poſſible." At ſix o'clock the commander threw out another ſignal for all ſhips to come into their ſtations;

ſtations; and at ſeven o'clock, wearied with expectation, he threw out a third ſignal, for each particular ſhip of the blue diviſion to come into her ſtation in the line; but all to no purpoſe, and the day finally cloſed before ſir Hugh Palliſer rejoined his commander. In the night the French made ſail for their own coaſt, and in the morning ſcarcely were the rearmoſt ſhips diſcernible from the top-maſt heads of the Engliſh fleet. Admiral Keppel therefore returned to Portſmouth to refit; but his public letter, containing an account of this tranſaction, occaſioned great ſpeculation; his deſire to ſcreen the miſconduct of the admiral of the blue, induced him to give ſuch a relation of this engagement, as ſeemed to imply great impropriety of behaviour in the commander himſelf. For no reaſon whatever was aſſigned for not renewing the engagement in the afternoon, except the expectation of the admiral, "that the French would fight it out handſomely the next day."

It was impoſſible that the truth ſhould not in ſome degree tranſpire; and a well-written letter appearing ſome time afterwards in the public prints, ſeverely reflecting on the conduct of ſir Hugh Palliſer, that officer thought proper to require from the commander in chief a formal diſavowal of the charges it contained, and a public juſtification of his character. This the commander abſolutely and indignantly declining, the vice-admiral immediately exhibited articles of accuſation againſt admiral Keppel, for miſconduct and neglect of duty on the 27th of July, 1778, although he had in the month of October a ſecond time ſailed with admiral Keppel, and had never before this ſo much as whiſpered a word to his prejudice. The lords of the admiralty, with apparent alacrity, fixed a day for the trial of the commander in chief; the reſult of which was in the higheſt degree honourable to that brave and injured officer, who was not only unanimouſly acquitted by the court-martial, but received the thanks of both houſes of parliament for his ſervices. Sir Hugh Palliſer afterwards demanded a court-martial upon himſelf, which terminated in a ſlight cenſure only; but the reſentment of the public was ſo great that it was deemed expedient by the miniſters to accept his ſucceſſive reſignations of his place at the board of admiralty, his lieutenant-generalſhip of marines, his government of Scarborough-caſtle, and to permit him to vacate his ſeat in the houſe of commons. The ready acquieſcence of the board of admiralty in the appointment of the court-martial, on a charge ſo groſsly invidious and unjuſt, gave the higheſt diſguſt to the officers of the navy. A ſtrong memorial was preſented to his majeſty on the ſubject by the duke of Bolton, ſigned by twelve admirals, with the venerable Hawke at their head, ſtating to his majeſty, in ſtrong colours, the ruinous conſequences which the precedent now introduced would inevitably bring upon all naval ſervice and diſcipline. "If, (ſaid theſe gallant defenders of their country,) we had conceived that this board had no legal uſe of their reaſon in a point of ſuch delicacy and importance, we ſhould have known on what terms we ſerved; but we never did imagine it poſſible that we were to receive orders from, and be accountable to, thoſe who by law were reduced to become mere paſſive inſtruments to the poſſible ignorance, malice, or treachery, of any individual, who might think fit to diſarm his majeſty's navy of its beſt and higheſt officers. We conceive it to be diſreſpectful to the laws of our country to ſuppoſe them capable of ſuch manifeſt injuſtice and abſurdity."

The only part of admiral Keppel's conduct really culpable, appears to have proceeded from that exceſs of deference and reſpect for ſir Hugh Palliſer, which prevented his adopting thoſe daring and deciſive meaſures the occaſion called for, in order to improve in the moſt effectual manner an opportunity of which he had little reaſon to expect the return. The courage of ſir Hugh Palliſer had been on many occaſions too conſpicuous to be queſtioned; but that principle of envy, ſo powerful in ſome minds, could not endure that a man whom he regarded in the light of a rival, ſhould acquire ſuch an addition of fame and ſuperiority as muſt have reſulted from a complete and decided victory. In conſequence of this fatal miſunderſtanding, lord Howe declared in parliament his reſolution to decline all future ſervice, ſo long as the preſent miniſters continued in office. A deciſive experience had taught him, that beſides riſking his honour and profeſſional character in ſuch an attempt, he could not, under ſuch counſels, render any eſſential ſervice to his country. The Howes, impatient of the obloquy now thrown upon them by the partiſans of the miniſtry, earneſtly ſolicited a parliamentary enquiry into their conduct in America; to which the miniſter at length very reluctantly aſſented. A multitude of papers were in conſequence laid upon the table; and the houſe reſolving itſelf into a committee of enquiry, lord Cornwallis, ſir Charles Grey, ſir Guy Carleton, and various other officers of high reputation who had ſerved in America, were examined at the bar of the houſe; and the reſult of a long and tedious inveſtigation was, "That the force ſent to America was at no time equal to the ſubjugation of that continent; that the people of America were almoſt unanimous in their enmity and reſiſtance to Great Britain; that the nature of the country was beyond any other difficult and impracticable for military operations; and that there was no fairer proſpect of ſucceſs, in any ſubſequent attempt at conqueſt, than in thoſe which had been already made." On the 29th of June, 1779, the committee was ſuddenly diſſolved, without coming to a ſingle reſolution on any part of the buſineſs.

A ſhort time before the prorogation, a royal meſſage was unexpectedly delivered to both houſes, on a ſubject of the higheſt importance, informing them, that a manifeſto had been preſented to his majeſty by the count d'Almodovar, ambaſſador of the king of Spain, containing a declaration of hoſtility on the part of the Catholic king, who had in conſequence ordered his ambaſſador to depart without taking leave. The diſcloſure of this alarming event, ſo long predicted by the minority, called forth all their powers of eloquence and invective. The miniſters were reminded of their incredulity on this ſubject, and of their unfounded declarations, "that Spain could have no intereſt in joining our enemies; Spain had colonies of her own, and would not ſet ſo bad an example as to afford aid or ſuccour to our rebellious colonies. The honour, ſincerity, and fidelity, of the court of Spain, were held up as ſacred, and thus were parliament and the nation kept in a conſtant ſtate of deluſion, until awakened from their dream by impending ruin."

On the 3d of July, the king cloſed the ſeſſion with a ſpeech, in which his majeſty mentioned it as a happy omen of the ſucceſs of his arms, that the increaſe of difficulties ſeemed only to augment the courage and conſtancy of the nation. The memorial of count d'Almodovar, and a long juſtificatory manifeſto ſubſequently publiſhed by the court of Madrid, were filled with heavy complaints of the conduct of the Engliſh court for ſeveral years paſt, though certainly grounded on no ſolid reaſon; the king of England truly affirming in his meſſage to parliament, "That with regard to Spain he had nothing to reproach himſelf with; and that his deſire to cultivate peace and amity with that power had been uniform and ſincere." The court of Madrid pretended, that the inſults and incredible violences offered to the Spaniſh traders by England, from the year 1776 to the beginning of the preſent year 1779, were no leſs than eighty-ſix in number, ſince which other inſults and injuries had been offered; ſo that the whole amount aroſe to the full complement of one hundred.

During the receſs of parliament, the earl of Stormont, late ambaſſador at Paris, was made ſecretary of ſtate in the room of the earl of Suffolk, deceaſed. The earl of Weymouth a ſecond time reſigned the ſeals of the ſouthern department, which were transferred to the earl of Hillſborough; and earl Bathurſt, chancellor of Great

Britain, was nominated preſident of the council, in the room of earl Gower. The great ſeal had been conſigned, in the courſe of the preceding year, to the attorney-general Thurlow, created baron Thurlow, a man endowed by nature with uncommon talents, which were concealed, and in effect loſt to the world, under an almoſt impervious veil of moroſeneſs. Under this miniſtry the war broke out with Spain.

In the Weſt Indies, ſoon after the failure of d'Eſtaing on St. Lucie, admiral Barrington was joined by admiral Byron; and the Engliſh fleet being now ſuperior to that of the French, endeavours were uſed to force the enemy to a general engagement; but they choſe, rather than encounter this riſk, to remain inactive in the harbour of Fort Royal. Admiral Byron, however, deeming it expedient to convoy the trade-ſhips collected at St. Chriſtopher's in June, part of their voyage; count d'Eſtaing took the opportunity of detaching a conſiderable force to the iſland of St. Vincent, which ſurrendered, though garriſoned by ſeven companies of regular troops, without firing a ſhot. This is aſcribed to the dread entertained of an inſurrection of the Caribbs, who ſtill entertained a deep reſentment of the injuries they had ſuſtained. The French commander, being now joined by a large reinforcement of ſhips and troops, ſailed with twenty-ſix ſhips of the line from Fort Royal, in the beginning of July, and ſteered his courſe to the iſland of Grenada, which, though bravely defended by the governor, lord Macartney, was compelled in a ſhort time to ſurrender at diſcretion. Admiral Byron, on his return, receiving intelligence of the capture of St. Vincent's, immediately determined to make an effort for its recovery; but, on his paſſage thither, heard the ſtill more unwelcome tidings of the attack of Grenada, of which he now reſolved to attempt the relief. On the 6th of July the two fleets came in ſight; but the French, having already effected their purpoſe, were little inclined, notwithſtanding their preſent ſuperiority, to riſk a cloſe engagement. A warm but indeciſive action enſued between the van diviſions of the two fleets, in the courſe of which the Engliſh firſt diſcovered the French colours flying on the fortreſs of St. George. In the reſult, the Engliſh fleet bore away for Antigua, and the French returned to Grenada.

Count d'Eſtaing being fully informed of the critical ſituation of the ſouthern provinces of America, now, unexpectedly directing his courſe to Georgia, made an eaſy capture of the Experiment, of fifty guns, with ſupplies of various kinds on-board for Savannah, and three other frigates, which he fell in with on his way. On the 9th of September he anchored off the mouth of the Savannah, to which general Prevoſt had again retired, and ſent a haughty ſummons to that officer to ſurrender to the arms of his moſt Chriſtian majeſty; to which a ſpirited anſwer was returned. The count d'Eſtaing being joined by general Lincoln, the allies advanced to the attack of the Britiſh lines on the morning of the 9th of October. They were every where repulſed with heroic valour. Count d'Eſtaing himſelf being wounded in the action, and the troops having ſuſtained great loſs, the ſiege was raiſed. The count now retired to the Weſt Indies; whence he quickly returned to France, much chagrined at the final diſappointment of the vaſt hopes and projects which he had originally formed.

During theſe tranſactions, much alarm had been created in England by the junction of the fleets of France and Spain, which took place very ſoon after the delivery of the Spaniſh manifeſto. In Auguſt, 1779, they entered the channel to the amount of ſixty-five ſhips of the line, accompanied by a cloud of frigates, ſloops, and fire-ſhips. The Engliſh fleet, commanded by ſir Charles Hardy, who had received no inſtructions to prevent this formidable junction, being utterly unable to encounter ſo prodigious a force, was compelled to retire, whilſt the flags of France and Spain menaced and inſulted the Engliſh coaſts, whilſt their ſhips rode triumphant in the Engliſh channel. Plymouth was, by the unaccountable negligence of the miniſters, left ſo entirely deſtitute of the means of defence, that the docks and ſhipping in the harbour might have been deſtroyed without difficulty. Fortunately this was not known to the confederate commanders; and on the approach of the equinox, count d'Orvilliers ſteered his courſe back to Breſt, without effecting any thing further than the capture of the Ardent man of war, which had ſailed into the midſt of the combined fleets while at anchor off Plymouth, miſtaking them for the Engliſh ſquadron. But the moſt remarkable conſequence reſulting from the appearance of this vaſt armament in the Britiſh ſeas, was the extraordinary vigour and reſolution with which it ſuddenly inſpired the inhabitants of the kingdom of Ireland, who had hitherto contented themſelves with feeble lamentations and unavailing complaints. Seeing themſelves in a manner abandoned by England, their troops withdrawn, their commerce unprotected, their grievances unredreſſed, military and mercantile aſſociations began every where to be formed; and in a ſhort time, to the aſtoniſhment of the world, an army of fifty thouſand volunteers, as if by magic, was created, diſciplined, and equipped; and reſolutions almoſt univerſally paſſed againſt the uſe of Britiſh manufactures.

The Engliſh miniſters, whoſe fears and apprehenſions on this occaſion happily ſupplied their deficiency in information, inſtead of oppoſing this national rage, furniſhed the new-raiſed army with arms from the royal magazines; and thus gave a ſanction to a meaſure which had been adopted without any regard to their conſent or approbation. The Iriſh parliament met on the 12th of October, and to the uſual addreſs brought forward by the courtiers, an amendment was moved, and adopted by a great majority, to inſert in the body of the addreſs the following words: "We beg leave humbly to repreſent to your majeſty, that it is not by temporary expedients, but by a free trade, that this nation is now to be ſaved from impending ruin." In this the lords concurred, and the addreſſes were carried up to the lord lieutenant with great parade amidſt the acclamations of the people; the duke of Leinſter, who commanded the Dublin volunteers, eſcorting the ſpeaker in perſon; and the thanks of both houſes were unanimouſly voted to the volunteer corps throughout the kingdom, for their patriotic exertions; and a ſix months money bill paſſed the commons, in order to prevent a ſudden prorogation.

Before we inveſtigate the conſequences of this alarming ſpirit, it may be proper to notice a further occaſion of miſunderſtanding between the courts of London and the Hague, from an encounter which took place in the courſe of the preſent ſummer between ſir Richard Pearſon of the Serapis man of war, accompanied by the Scarborough frigate, having under their convoy the trade from the Baltic, and captain Paul Jones, an adventurer of deſperate fortune and deſperate courage, who was commander of a ſmall American ſquadron, which had for ſome time paſt infeſted the Britiſh ſeas. After a very fierce and bloody action, both the Serapis and Scarborough, the convoy being firſt ſecured, were compelled to ſtrike their colours, and were carried by their captors to the Texel. On this a very ſtrong memorial was preſented to the ſtates-general by ſir Joſeph Yorke, who urged in the moſt preſſing terms, "That thoſe ſhips and their crews may be ſtopped and delivered up, which the pirate Paul Jones, who is a rebel ſubject, and a criminal of the ſtate, has taken." But their high mightineſſes anſwered, "That they will in no reſpect whatever pretend to judge of the legality or illegality of the actions of thoſe who have on the open ſeas taken any veſſels which do not belong to this country, and bring them into any ports of the republic; and that they are not authorized to paſs judgment either on thoſe prizes, or on the perſon of Paul Jones." This was an anſwer hard of digeſtion to the Engliſh, and which indeed clearly indicated the partiality of the republic to the cauſe of America; but the quarrel between the two countries, though

though evidently growing more and more ſerious, was not yet ſufficiently matured for an actual rupture.

Very early intelligence of the war with France having been ſent by expreſs over land to India, the city of Pondicherry was inveſted by the troops of the company and of the government, in the autumn of 1779; and, after a gallant reſiſtance by M. de Bellecombe, the governor, it ſurrendered to the arms of his Britannic majeſty. On the other hand, the ſettlement of Senegal, and the Britiſh forts on the river Gambia, were captured by a French ſquadron under M. de Lauzun.

On the 6th of December, a reſolution of cenſure on the miniſters was moved in the houſe of commons by the earl of Upper Oſſory, relative to the affairs of Ireland. His lordſhip obſerved, "that the miniſters ſeemed totally to have abandoned the government of that country to chance. They neither felt for its diſtreſſes, nor provided againſt its reſentments: the preſent ſtate of Ireland, (his lordſhip ſaid,) was truly alarming, and ſeemed to portend a ſudden diſſolution of the conſtitutional connection which had ſo long ſubſiſted between the two countries. To the ſhameful inattention of the miniſtry, who might in the early ſtages of the miſeries of that kingdom have granted the Iriſh nation ſubſtantial relief, was the preſent ſpirit of reſiſtance wholly imputable." The motion was powerfully ſupported by Mr. Fox, Mr Burke, and Mr. Dunning; and oppoſed in an elaborate ſpeech by lord North, who pledged himſelf, on a given day, to move certain propoſitions favourable to Ireland. On the day previouſly fixed, lord North accordingly brought forward his propoſitions reſpecting Ireland, which opened her commerce, and allowed the free exportation of her woollens. Theſe privileges were received in Ireland, not only with ſatisfaction, but with exultation and joy, from the flattering expectation of deriving from them an effectual relief to her diſtreſſes.

An act of parliament had paſſed in the courſe of the ſeſſion of 1778, relieving the Roman catholics from ſome of the heavier penalties inflicted upon them in the ſeventeenth century. This act ſeemed to be well approved in England; but the fanatical ſpirit, unextinguiſhed ſince the days of Knox, and which ſtill diſcovered itſelf by unequivocal ſymptoms in Scotland, prevented the extenſion of this defective toleration to that kingdom. Yet on the bare ſuſpicion of ſuch an indulgence, great tumults took place at Edinburgh and Glaſgow, the popiſh chapel in the metropolis was deſtroyed, and the houſes of the principal catholics attacked and plundered; on which the lord provoſt publiſhed a ſingular proclamation, aſcribing the riots to the "apprehenſions, fears, and diſtreſſed minds, of well-meaning people, and aſſuring them no repeal of the penal ſtatutes would take place." Incited by this encouraging declaration, the fanatics formed themſelves into a ſociety, ſtyled the "Proteſtant Aſſociation," to oppoſe any remiſſion of the perſecuting laws againſt the papiſts; and of this aſſociation lord George Gordon was choſen preſident, a man in the higheſt degree wild, eccentric, and enthuſiaſtical. This aſſociation was gradually extended to England, and much pains were taken by inflammatory harangues and pamphlets to prejudice the minds of the vulgar againſt the late ſalutary relaxation of the penal code. It was at length determined to prepare a petition for a repeal of the law in queſtion, which is affirmed to have obtained one hundred and twenty thouſand ſignatures, or marks, of men of the loweſt orders of ſociety, whoſe exceſs of zeal could be equalled only by the groſſneſs of their ignorance; a combination of qualities at once ridiculous and terrible. Lord George Gordon, who was himſelf a member of the houſe of commons, declined to preſent this petition, unleſs he were accompanied to the houſe by at leaſt twenty thouſand men.

A public meeting of the aſſociation was, in conſequence, convened in St. George's Fields, London, June 2, 1780, whence it was ſuppoſed that not leſs than fifty thouſand perſons proceeded in regular diviſions, with lord George Gordon at their head, to the houſe of commons, where their petition was preſented by their preſident. Towards evening this multitude began to grow tumultuous, and groſsly inſulted various members of both houſes, compelling them in paſſing to and from the houſe to cry, "No popery!" and to wear blue cockades. During the debate on the petition, lord George Gordon frequently addreſſed the mob without, in terms calculated to inflame their paſſions, and expreſsly ſtating to them, "that the people of Scotland had no redreſs till they pulled down the popiſh chapels." After the adjournment of the houſe, the mob, on this ſuggeſtion, immediately proceeded to the demolition of the chapels of the Sardinian and Bavarian ambaſſadors. The military being ordered out could not prevent the miſchief, but apprehended ſeveral of the ring-leaders.

The next day, Saturday, paſſed quietly; but on Sunday the rioters re-aſſembled in vaſt numbers, and deſtroyed the chapels and private dwellings belonging to the principal catholics in the vicinity of Moorfields. On Monday they extended their devaſtations to other parts of the town; and ſir George Saville's houſe, in Leiceſter-ſquare was totally demoliſhed by theſe blind and barbarous bigots; that diſtinguiſhed ſenator and patriot having had the honour to be the firſt mover of the bill. On Tueſday, the day appointed for taking the petition into conſideration, the mob again ſurrounded the parliament houſe, and renewed their outrages and inſults. The houſe, after paſſing ſome reſolutions adapted to the occaſion, and expreſſive of their juſt indignation, immediately adjourned. In the evening the populace, now grown more bold, attacked the priſon of Newgate, where ſeveral of their comrades were confined; and, ſetting the building in flames, liberated more than three hundred felons and debtors reſident within its walls. Encouraged by the impunity with which they had hitherto been ſuffered to go on, they next proceeded to lord Mansfield's houſe in Bloomſbury ſquare, which they totally demoliſhed, his lordſhip eſcaping with great difficulty. The priſons of Clerkenwell were alſo forced, many private houſes plundered or deſtroyed, and ſcarcely did the night afford any ceſſation of the riots.

On Wedneſday the mob, hardened by the miſchiefs and villanies they had already perpetrated, attacked with incredible fury the houſes of various individuals, chiefly catholics, which they had previouſly marked for deſtruction. In the evening the King's-bench, the Fleet priſon, and the new compter, were ſet on fire, and, with a prodigious number of private dwellings in different parts of the town burning at the ſame time, formed a tremendous ſcene of conflagration, to which London, ſince the great fire of 1666, had ſeen nothing parallel or ſimilar. The ſame day attempts were made by the rioters on the bank and pay-office; but theſe, being ſtrongly guarded, happily eſcaped that deſtruction which muſt have involved the whole nation in irreparable diſtreſs and ruin. What appeared moſt to excite the public indignation was the criminal ſupineneſs of the magiſtracy of London during theſe horrible commotions, apparently threatening to lay the metropolis of the empire level with the ground, and which actually preſented in many parts the image of of a city ſtormed and ſacked. At length the king himſelf declared, with laudable reſolution, in council, "that, although the magiſtrates had not done their duty, he would not be deficient in his," and general orders were immediately tranſmitted to the military to fire upon the rioters, without waiting for directions from the civil magiſtrate, in conſequence of which the ſlaughter was terrible; but in a ſhort time the commotions were effectually ſuppreſſed, and by Thurſday noon order and tranquillity were perfectly reſtored.

On that day lord George Gordon was taken into cuſtody, and, after a ſtrict examination before the privy council, committed cloſe priſoner to the Tower on a charge

of high treaſon, for which there does not appear to have been ſufficient ground, and therefore on his trial he was acquitted. An impeachment by the houſe of commons for high crimes and miſdemeanors would have been a mode of procedure far more eligible and efficacious, and would indubitably have inſured that puniſhment which his raſh conduct ſo juſtly merited.

A ſpecial commiſſion was iſſued for the trial of the rioters, of whom a great number, conſiſting of men very oppoſite in deſcription and character, were apprehended; many of whom ſuffered death. On the 19th of June the parliament met, and the king going in ſtate to the houſe of peers, made a very judicious ſpeech, "lamenting the neceſſity which had obliged him, by every tie of duty and affection to his people, to employ the force entruſted to him for the ſuppreſſion of thoſe acts of felony and treaſon, which had borne down all civil authority, and threatened the immediate ſubverſion of all legal power, the deſtruction of all property, and the confuſion of every order in the ſtate; at the ſame time renewing his aſſurances, that he had no other object than to make the laws of the realm, and the principles of the conſtitution, the rule and meaſure of his conduct." An addreſs of thanks was deſervedly voted in reply to this laudable ſpeech, without a ſingle negative.

The political alienation which had for ſome years taken place between England and Holland, now began to unfold itſelf. A requiſition had been made by the court of London to the ſtates general, ſoon after the declaration of war againſt Spain, for the ſuccours ſtipulated by the treaty of 1678, confirmed by various ſubſequent agreements; but no anſwer could be obtained from their high mightineſſes. On the contrary, loud complaints were made of the conduct of the Engliſh court, which had cauſed to be ſeized, and carried into the different ports of Great Britain, ſhips belonging to the ſubjects of the republic, navigated under the faith of treaties, and not laden with contraband goods. On the other hand, Great Britain complained that France received from Holland continual ſupplies of naval and military ſtores, contrary to the faith of treaties; and that the principle of ſelf-defence warranted the ſeizure and detention of all veſſels laden with ſuch exceptionable cargoes.

On the 1ſt of January, 1780, commodore Fielding fell in with a fleet of Dutch merchant ſhips off Portland, convoyed by a ſmall ſquadron commanded by count Byland. Captain Fielding deſiring permiſſion to viſit the merchant ſhips, in order to aſcertain whether they contained any contraband goods, was refuſed by the Dutch admiral; on which he fired a ſhot a-head of the count, who returned a broadſide: commodore Fielding did the ſame, and then the Dutch immediately ſtruck their colours. Such of the merchant ſhips as had naval ſtores on-board were ſtopped, and the Dutch admiral was informed that he was at liberty to hoiſt his colours and proſecute his voyage. But he refuſed to quit his convoy, and accompanied the commodore to Portſmouth. A memorial in ſtrong and reſentful terms was preſented by the Dutch ambaſſador, count Welderen, by order of the ſtates, in conſequence of this tranſaction, which was repreſented as a direct attack upon the independence and ſovereignty of their high mightineſſes; and a peremptory demand was made of reparation and redreſs, to which no regard was paid. But on the 17th of April a declaration was publiſhed by the king of Great Britain, by which it was announced, "That repeated memorials having been preſented by his majeſty's ambaſſador to the ſtates general, demanding the ſuccours ſtipulated by treaty, to which requiſition they had given no anſwer, nor ſignified any intention of compliance, his majeſty conſidered their high mightineſſes as having deſerted the alliance that had ſo long ſubſiſted between Great Britain and the republic; and his majeſty from this time ſuſpended, proviſionally, all the ſtipulations of the ſeveral exiſting treaties, particularly of the marine treaty, concluded at London, A. D. 1674."

Holland was, however, far from being ſingular in her complaints reſpecting the violated rights of neutrality. The powers of the Baltic, with a firmer tone, and in more decided language, declared their reſolution to adopt ſuch meaſures as were neceſſary for their own ſecurity. Early in the ſpring of 1780, the empreſs of Ruſſia addreſſed a declaration to the courts of London, Verſailles, and Madrid, containing an explicit ſtatement of the principles on which ſhe had determined to act for the removal of thoſe moleſtations which had interrupted the navigation of her ſubjects, and for the protection of the liberty of commerce in general. The radical principles here laid down were: I. That neutral ſhips ſhould enjoy a free navigation even from port to port, and on the coaſts of the belligerent powers. II. That all effects belonging to the ſubjects of the belligerent powers ſhall be looked upon as free on-board ſuch neutral ſhips, excepting only warlike ſtores or ammunition; but neither the veſſels, paſſengers, nor the reſt of the goods, ſhall be liable to ſeizure or detention. "To theſe principles, (her imperial majeſty declared,) ſhe was firmly reſolved to adhere; and, for the honour of her flag, and the ſecurity of her ſubjects, ſhe had ordered a conſiderable part of her naval forces to be equipped, to act wherever her honour, intereſt, or neceſſity, ſhould require." Denmark and Sweden, according in form to this declaration of Ruſſia, and ordering ſimilar equipments of their marine, this confederacy of the powers of the north acquired the appellation of "the armed neutrality;" and the baſis on which it was founded ſeemed to give univerſal ſatisfaction throughout Europe; England alone, againſt whom it was manifeſtly levelled, excepted.

Great Britain, thus menaced on all ſides, nevertheleſs purſued the war with vigour; and Spain commenced her offenſive operations with the blockade of Gibraltar. Early in 1780, ſir George Rodney was appointed to the command of a powerful fleet, deſtined for the relief of that garriſon, having on-board prince William-Henry, the third ſon of his majeſty. On the northern coaſt of Spain he fell in a convoy of twenty-two merchant-ſhips, richly laden, under the protection of a ſquadron of ſeven ſhips of war, to which he immediately gave chace, and in a few hours the whole were taken. This ſucceſs was the prelude to another and much greater.

On the 16th of January, off Cape St. Vincent, he deſcried a Spaniſh ſquadron, conſiſting of fourteen ſail of the line, which he directly bore down upon, and, notwithſtanding the ſtormy ſeaſon, taking the lee-gage, in order to prevent the enemy from retreating into their own ports; at four in the afternoon the action began, and in little more than half an hour one of the Spaniſh ſhips blew up with a dreadful exploſion. The engagement, nevertheleſs, continued with unabating fury in the midſt of darkneſs; and, before morning, the Phœnix, of eighty guns, don Juan de Langara, the Spaniſh admiral's own ſhip; the Monarca, the Princeſſa, the Diligenti, of ſeventy guns each, ſtruck their colours; the St. Julien, and St. Eugenio, were alſo captured; but through the violence of the tempeſt, were driven on-ſhore and loſt. The others eſcaped in a very ſhattered condition, and the whole ſquadron, as to any immediate capability of ſervice, might be conſidered as annihilated. Though the force of admiral Rodney was greatly ſuperior, his ſkill and courage were fully apparent in the mode of conducting the attack, which the violence of the ſtorm, the darkneſs of the night, and the vicinity of a lee-ſhore, every where encircled with ſhoals and breakers, rendered extremely dangerous; the admiral's own ſhip, the Sandwich, and ſeveral others, were in extreme hazard of being loſt on the ſhoals of St. Lucar, and did not get into deep water till the next day. After effecting the primary object of his commiſſion, the relief of Gibraltar, ſir George Rodney proceeded to the Weſt Indies, ſending home his prizes under the care of admiral Digby, who, on his paſſage, captured the Prothée, a French ſhip of ſixty-four guns, and part of her convoy

of

of merchant-ships. No sooner had admiral Rodney taken upon him the command in the West Indies, than every possible exertion was made to bring on a general action, which count de Guichen, who commanded the French fleet, cautiously avoided; but intelligence being received that in the night of the 15th of April, 1780, they had put to sea with their whole force, Rodney, who was stationed at St. Lucie, immediately followed, and early on the morning of the 17th he came in sight of the enemy; at noon the admiral made the signal for a general and close engagement, himself setting a noble example of courage to the fleet by bearing down upon the French admiral, whom he fought with unremitting fury till the enemy bore away, leaving the Sandwich, which from causes not easily or clearly ascertainable, was very ill supported in this action, a mere wreck upon the water. Other partial and indecisive encounters also took place, in which little inferiority of skill or courage was discernible on the part of the French officers or seamen.

During these transactions in the West Indies, don Galvez, the Spanish governor of Louisiana, reduced the British settlements on the Mississippi, and had made great progress in the conquest of the province of West Florida, though Pensacola held out to the next year. As a very inadequate counterbalance to these successes, an expedition had been undertaken from Jamaica to the Spanish main; and the fortress of Omoa, which contained a considerable booty in specie and merchandise, was taken by storm, but soon afterwards evacuated. A very heavy misfortune in the autumn of this year took place, in the entire capture of the outward-bound East and West India fleets, in the Bay of Biscay, by the Spaniards; a loss which had no parallel in the naval and commercial history of Great Britain, since the famous capture of the Smyrna fleet, in the reign of king William.

On the 3d of September, 1780, the Mercury, a congress packet, was taken by the Vestal frigate, off the banks of Newfoundland. On-board this packet was Mr. Laurens, president of the American congress, charged with a commission to Holland. On being brought to England, he was examined by the privy council, and committed close prisoner to the Tower, on an accusation of high treason. His papers, which had been thrown overboard, and by great dexterity and diligence recovered and deciphered, were found to contain the sketch of a treaty of amity and commerce between the republic of Holland and the states of America. This treaty appeared to be in a train of negociation, and to have received the sanction and approbation of M. Van Berkel, counsellor and pensionary of Amsterdam. Such was the high offence taken by the court of London at this discovery, that orders were transmitted to sir Joseph Yorke immediately to leave the Hague, and a declaration of war was made against Holland on the 20th of December, 1780. This was a measure totally unexpected on the part of the states general, who were ill-prepared for such a rupture. Before the departure of count Welderen from the court of London, he delivered, by order of the states, a letter to lord Stormont, which his lordship returned unopened; the war having been decided on in the cabinet as inevitable.

A very considerable portion of the first session of the new parliament, which met on the 31st of October, 1780, was occupied in the consideration of the affairs of India, from the period in which the memorable bill of regulation framed by lord North, A. D. 1773, passed into a law. In the month of April, 1772, took place, in consequence of the removal of governor Cartier, the memorable appointment of Warren Hastings, esq. as governor-general of Bengal; a man, whose conduct throughout all the inferior gradations of office stood confessedly unimpeached. The members of the supreme council at the same time appointed under him were, sir John Clavering, colonel Monson, and Philip Francis, esq. That the reader may be enabled to form a competent idea of the nature of Indian politics, and of the mode of traffic by which such immense fortunes were all at once poured into England from that opulent country, we shall, from the documents furnished by the public enquiry into the conduct of Mr. Hastings in Hindoostan, give a faint outline of the government under which such riches were acquired, and which called so loudly for the interference of the British parliament.

The project which had been unjustly adopted in India, and so universally execrated in England, of setting up the lands of the zemindars, polygars, &c. to public auction, still appeared, from the immediate adoption of this system by the new governor, to be the favourite policy of Mr. Hastings himself. In the space of about two hundred years, during which the kingdom of Bengal and its appendages had been under the Mahomedan government, the original ground rents or heriots, *aussil jumma*, of the zemindars, and other great hereditary landholders who held under the government, had never been raised; and a permanent interest being thus created in the land, the talookdars, polygars, and ryots, who possessed the subordinate rights of property under the zemindars, were neither themselves oppressed, nor allowed to oppress the actual occupants and cultivators of the soil. But from the period that Bengal fell into the hands of the English, this judicious regulation appears to have been annihilated, by unreasonably advancing the fee-farm rents. Mr. Hastings, among the first acts of his government, instituted a committee of circuit, invested with the power to dispose of all the lands in the province, from the highest zemindar down to the lowest ryot, by public auction, to farm for the term of five years. The pretext for this bold measure, was the decay of the public revenue, of which, in consequence of this system, Mr. Hastings had the courage to promise the court of directors an immediate and progressive augmentation; acknowledging, nevertheless, the country at the same time to be in a languishing state, and that the population had decreased in the proportion of one-third since the first grant of the dewannee, or sovereign jurisdiction, from the Mogul emperor. The most dreadful confusion began to ensue; and Mr. Hastings, in his minute of April, 1773, confesses, "That the expected improvement had not taken place, being obstructed by a circumstance which could not be foreseen, viz. the farmers having engaged for a higher revenue than their districts could afford. It is true (says he) that the lands were almost all over-bid for; and many let to indigent and desperate adventurers; but this was unavoidable in such a mode." The deficiency in the revenue was in fact enormous, falling, in five years, no less than two millions and a half short of the settlement. The lands being on all hands admitted to be partially overrated, the governor and council were of course called upon to exercise a discretionary power of remission. This at once opened an immense field of fraud and peculation, and could not fail to prove to individuals, *in certain situations*, an exhaustless source of wealth. The court of directors declared themselves, in the sequel, "fully aware of the duplicity which had been practised in the letting out the lands in Bengal; that flagrant corruption and great oppressions had been committed;" and they ordered a prosecution to be commenced against the persons who composed the committee of circuit. But after long and studied delays, Mr. Hastings ultimately proposed, and carried his proposition in council, "That orders should be given for withdrawing the said prosecution." It is worthy of remark, that the banyan, or black steward, of Mr. Hastings, Cantoo Baboo, rented, under the new tenure, lands to the value of 150,000l. per annum; and remissions to a very great amount were granted to this man, as well as to all those whose reasons appeared to the governor and council equally valid. The zemindary of Baharbund, taken from the rannee of Radshi, was also given in perpetuity to Cantoo Baboo, at a rent of 82,000 rupees, although the value of it was rated at 350,000. The same Cantoo Baboo was also permitted to contract largely

largely for the proviſion of the company's inveſtments; "but this (the court of directors, in their general letter of December, 1776, ſay,) we poſitively forbid in future." The aſtoniſhment into which ſir John Clavering and his colleagues were thrown, on being apprized of this extraordinary ſtate of things in Bengal, was much increaſed by the alarming information of a war, into which the governor-general had recently entered, in conjunction with the vizier Sujah ul Dowla, nabob of Oude, for the abſolute conqueſt and extirpation of the nation of the Rohillas, inhabiting the fertile and beautiful province of Rohilcund, ſituated to the northward of the dominions of the vizier, and bounded by the high range of mountains dividing Hindooſtan from Tartary. It was not pretended by Mr. Haſtings, that the company had received any injury whatever from the Rohilla nation; but that we engaged in the war ſolely as allies of the nabob vizier. The cauſes or pretexts of the quarrel, with reſpect to the vizier himſelf, were of a nature palpably unreaſonable and unjuſt. The Rohilla nation, being involved in hoſtilities with the Mahrattas, had applied to the vizier for aſſiſtance, who agreed to furniſh them with a large body of troops for an equivalent in money. But, through the dilatory, or perhaps inſidious, policy of the vizier, the auxiliary troops did not arrive till the enemy were repulſed. The Rohilla government, therefore, objected to the payment of the promiſed ſtipend; on which the vizier, with the concurrence of Mr. Haſtings, determined to declare war againſt the Rohillas, for the purpoſe of adding ſo deſirable a territory to his dominions. Such is the Rohilla ſtatement of the caſe. Nevertheleſs, ſir Robert Barker, and the other officers employed in this expedition, ſtrongly atteſt the performance of the ſervice contracted for by the vizier, in their reſpective examinations at the bar of the houſe of commons. The Rohillas, in the higheſt degree alarmed, offered to ſubmit the whole cauſe of diſpute to the arbitration of the Engliſh; but this was declined by Mr. Haſtings, who urged the vizier in ſtrong terms to the execution of his deſign, declaring to him, "That it would be abſolutely neceſſary to perſevere in it until it ſhould be accompliſhed; and that he could not hazard or anſwer for the diſpleaſure of the company, if they ſhould find themſelves engaged in a fruitleſs war, or in a ruinous expence for proſecuting it." This apprehenſion was founded on very reaſonable grounds; for the court of directors, in their inſtructions to the ſupreme council, had laid it down as an unalterable maxim, "That they were to avoid taking part in the political ſchemes of any of the country princes, particularly of the nabob of Oude, of whoſe ambitious diſpoſition they were well apprized."

A conſiderable body of troops under colonel Champion, being detached to the aid of the vizier, entered the province of Rohilcund, and a pitched battle took place, in which Hafiz Rhamel, the principal leader of the Rohillas, and many other of their chieftains, were ſlain. The whole country, deſcribed as "a garden not having one ſpot in it of uncultivated ground," was, in conſequence of this war, converted into a barren waſte, and in a great meaſure depopulated, either by the rigours of military execution, or by forcing the wretched inhabitants beyond the mountains, to wander and periſh in the Tartarian deſerts. For this ſervice, the vizier had agreed to pay into the treaſury of Calcutta the ſum of forty lacks of rupees; and Mr. Haſtings, in vindication of his conduct, alleged, and in his memorable parliamentary defence entered upon record, the following very extraordinary reaſons: "The acquiſition of this ſum to the company, and of ſo much ſpecie added to the exhauſted currency of our provinces, that it would give wealth to the nabob of Oude, of which we ſhould participate; that he ſhould be always ready to profeſs, that he did reckon the probable acquiſition of wealth among his reaſons for taking up arms againſt his neighbours; that it would eaſe the company of a conſiderable part of their military expence, and preſerve their troops from inactivity and relaxation of diſcipline; that the Rohillas are not a nation, but a body of foreign adventurers, who had made a conqueſt of the country about ſixty years before. See the article HINDOOSTAN. That this province would be a moſt commodious acquiſition, and the weakneſs of the Rohillas, with the open and defenceleſs ſtate of the country, promiſed an eaſy conqueſt; and finally, that ſuch was his idea of the company's diſtreſs at home, added to his knowledge of their wants abroad, that he ſhould have been glad of any occaſion to employ their forces which ſaved ſo much of their pay and expences."

The principal of the Rohilla chieftains, who eſcaped from the deciſive battle of St. George, was Fyzoola Khan, who retired to a remote part of the country with his treaſures, and the ſhattered remains of the Rohilla army; and after the death of Hafiz, renowned throughout the eaſt for the ſuperiority of his intellectual talents and perſonal accompliſhments, Fyzoola Khan was very generally acknowledged as the head of this unfortunate nation. Finding his utter inability to continue the war, he ſued in very ſubmiſſive terms for peace; which the vizier, through the interceſſion of colonel Champion, thought proper to grant; and a treaty was accordingly ſigned at Lall-Dang, October 1774, agreeably to which Fyzoola Khan was confirmed in the poſſeſſion of Rampore, Shawabad, and ſome adjoining diſtricts; on condition of giving up half his treaſure, and of furniſhing a certain ſtipulated quota of troops when called upon. Thus the Rohilla war ended: but it was ſubſequently condemned in deciſive terms by a formal reſolution of the court of directors in London, paſſed November 1775, "as contrary to the expreſs and repeated orders of the court, and inconſiſtent with the principles both of policy and juſtice;" and this reſolve was, with the omiſſion of the laſt word, confirmed by a vote of the court of proprietors.

After having made the acquiſition of Bengal, the company at home ſeemed fully ſatisfied with the extent of their conqueſts; and the diſpatches of the court of directors were from that period filled with rigorous injunctions to avoid all offenſive wars, in which they appear perpetually apprehenſive that the ambition, temerity, and avarice, of their ſervants in India would involve them. Nevertheleſs, at the diſtance of half the globe from the ſcene of action, it was impoſſible not to allow in the execution of their orders ſome latitude of diſcretion. "The ſituation of affairs, (ſay they, in their general letter of the 30th of June, 1769,) may be varied by unforeſeen events at the very moment we are writing; whenever you think yourſelves obliged for our ſecurity upon emergent occaſions to adopt meaſures of a contrary, i. e. hoſtile tendency, you are to give us very full reaſons for ſuch deviations." In another letter they ſay, "You muſt undoubtedly act according to the emergency of affairs:" and again, in another diſpatch, "As we know not what alliances may be formed to juſtify us in carrying our arms beyond the bounds of the provinces, we are prevented from propoſing any preciſe plan for your guidance in this reſpect."

Theſe neceſſary and unavoidable conceſſions on the part of the directors, Mr. Haſtings, in his minutes of defence, converts into a juſtification of the Rohilla war; although the Rohillas were as unwilling as they were unable to do any injury to the company. The real grounds of the war, however, appeared ſufficiently obvious. The pretext held out was, that the vizier, as an ally of the company, was entitled to our aſſiſtance; and that, as guarantees of the treaty between him and the Rohilla chiefs, we were bound to grant it. Without adverting to the juſtice or injuſtice of the vizier's demand on the Rohillas, it is enough to ſay, that this pretended guarantee conſiſted only in the treaty being ſigned at the requeſt of the Rohillas themſelves, from their well-grounded diſtruſt of the vizier, in the preſence of ſir Robert Barker, commander in chief of the company's forces, as a witneſs of

the

the ſame. It is not pretended that ſir Robert Barker had authority to pledge the company as guarantees of the treaty; and that he ſhould take upon him to bind the government by ſo ſerious and important an act, without ſpecial inſtruction and direction, is an incredible ſuppoſition; and in fact, ſir Robert Barker, being interrogated at the bar of the houſe of commons, "Whether he conceived that he had by any act of his bound the company to a guarantee of the treaty by war?" anſwered poſitively, "I did not." Alſo, in a letter written even before the actual concluſion of the treaty, he declares, "That it was the furtheſt from his intention that the company ſhould in any reſpect whatever be mentioned in the agreement between the vizier and the Rohillas."

From the firſt ſuggeſtion of this project of conqueſt and extirpation by the vizier of Oude, it is evident that Mr. Haſtings urged its proſecution with an ardour far ſuperior to that diſcovered by the nabob, whoſe ambition was counteracted by his avarice, and who on cool reflection appears to have thought the prize ſcarcely worth the purchaſe. "I availed myſelf, (ſays Mr. Haſtings,) of his eager ſolicitude for the attainment of this point, to engage his aſſent to another meaſure of much greater value to the company; that is to ſay, the increaſe of his annual payments or ſubſidy to the amount of two hundred and ten thouſand rupees per month." But it is ſufficiently evident, that when this conceſſion was once extorted from the vizier, his ſolicitude for the war began to ſink into indifference.

In a letter written by Mr. Haſtings to the vizier, April 21, 1773, he enlarges on the great advantage which would reſult to the vizier from the reduction of the Rohilla country; "becauſe (ſays he) by that means the defenſive line of your dominions would be completed, by including within it all the land lying on that ſide of the river Ganges."—"The allurement (to adopt the language of Mr. Haſtings, in his defence,) thus held out to the vizier, ſucceeded. He propoſed, in reply, a meeting with me at Benares. I found him ſtill equally bent on the deſign of reducing the Rohillas, which I encouraged as I had before done, by dwelling on the advantages which he would derive from its ſucceſs; by objecting with great force the orders of the company reſtricting us from ſuch remote ſchemes of conqueſt, to which I therefore could not aſſent without ſuch conditions obtained in return for it as might obviate their diſpleaſure, and win their ſanction to ſo hazardous and unauthorized a meaſure. Having at length obtained this point, viz. the increaſe of the ſubſidy, I eaſily yielded my aſſent to the Rohilla plan, on the ſtipulation of forty lacks for its accompliſhment. (A lack of rupees, at par, amounts to 12,500l. ſterling.) As a precaution againſt any effects which were to be apprehended from the vizier's irreſolution, the conditions originally accepted were dictated to him in the form of a letter, to be written by him, in which a clauſe was inſerted, 'that whether the country was conquered, or a peace concluded between him and the enemy, the ſtipulation for the forty lacks ſhould become *equally due*.' Thus, at laſt, (ſays Mr. Haſtings,) an occaſion took place, when, by a ſlight deviation from the defenſive plan, our alliance with the vizier might be converted into ſolid advantages. In effect, the ſame reaſons which before urged us to ſhun every military expedition, now operated in the contrary direction, and recommended the employment of our army for the purpoſe of reducing our expences, and adding to our currency."

As to the mode in which this war of extirpation was conducted, we are aſſured that colonel Champion never mentioned the ſervice on which he was employed without the deepeſt expreſſions of grief and abhorrence. "Whilſt all Aſia knows, (ſays this commander,) that the Engliſh gave him, i. e. Sujah, the nabob of Oude, the rod, will they not reaſonably conclude that the ſcourges which the agent gives are connived at? will they not ſay every Engliſh chief is another Sujah?"—"The authority given to the vizier over the army, (ſays the colonel, in a letter to Mr. Haſtings, dated May 10, 1774,) has totally abſorbed that degree of conſequence due to my ſtation. My hands have been tied up from giving protection to the miſerable. I have been obliged to lend a deaf ear to the lamentable cries of the widow and the fatherleſs, and ſhut my eyes againſt a wanton diſplay of violence and oppreſſion, of inhumanity and cruelty. The company's intereſt conſtrained me in public to ſtifle the workings of my feelings, but I muſt give way to them in private; it would affect your ſenſibility too much, were I to deſcend to particulars. The family of Hafiz, the Begums included, have been driven to the neceſſity of making ſupplications for a little rice and water; and of the priſoners, many have died for want of ſuſtenance. I wiſh to leave ſcenes which none but the mercileſs Sujah can bear without heart-bleeding pain: relieve me, therefore, as ſoon as poſſible." In a moving repreſentation to the colonel from the ſons of Hafiz, of their manifold diſtreſſes, they ſay of the vizier, "He has deprived us of our country, our riches, and even of our honour; and not ſatisfied with that, he is going to ſend us priſoners to Fyzabad. We deſire no country, no riches, no palaces; but at Biſſoulee are the tombs of our noble anceſtors: near them, under ſome ſhade, we beg permiſſion to ſpend the remainder of our days as faquiers." Theſe things the colonel ſays he is compelled to ſtate, although the ungracious reception of his former repreſentations gave him but little encouragement to plead the cauſe of the unfortunate.

In a ſubſequent letter, dated June 15, 1774, the colonel deſires that he may be empowered to withdraw the Engliſh troops, in caſe the vizier will not otherwiſe be prevailed upon to deſiſt from his enormities: but this Mr. Haſtings, in his reply, declares to be "obviouſly inadmiſſible. Where, (ſaid he,) is our authority to judge or controul the conduct of the vizier, further than reſpects his engagements with us? Even granting we had an authority to controul the vizier's conduct in the manner you propoſe, we muſt have demonſtration of the infallibility of the perſon we entruſted with ſuch an authority, before we could be vindicated in the delegation of it. All the country ſubdued becomes abſolutely the vizier's. On the terms you propoſe, the Engliſh commander would ſuperſede his authority in the government of his new poſſeſſions." In lieu, therefore, of the expedient ſuggeſted by the humanity of colonel Champion, the governor-general ordered his reſident, Mr. Middleton, to remonſtrate and expoſtulate with the vizier concerning his conduct towards the Rohillas, "in order to exculpate the Engliſh government from the imputation of aſſenting to ſuch a procedure." But ſo little did the vizier regard theſe feeble and formal remonſtrances, that the family of Hafiz, after ſuffering the moſt dreadful and ſhocking indignities, were carried in captivity to Fyzabad.

In a ſubſequent letter from the nabob Mahub Ulla Khan, eldeſt ſon of Hafiz, he moſt earneſtly ſupplicates, in the name of God and Chriſt, the interpoſition of the Engliſh commander for their releaſe. "O my guardian! (ſays he,) turn your face to the buſineſs of a ſlave, and have us enlarged, and it will not go unrewarded." As to the plea ſet up in defence of this unprovoked invaſion, "That the Rohillas were not a nation, but a body of foreign adventurers, who poſſeſſed the country by a preſcription of only ſixty years;" it is ſufficient to know, that the inhabitants of Rohilcund, under their civil government, enjoyed peace and proſperity; that theſe people were able to bring an army of fifty or ſixty thouſand men into the field; and that it might with infinitely more force be retorted on the Engliſh themſelves, that they were a body of "foreign adventurers," who had been at this time ſcarcely ſeven ſummers in poſſeſſion of the country they occupied. With equal feeling and animation it has been ſaid in relation to the general infamy of the Rohilla war, "There is no power in this world that can annihilate ſuch a queſtion—though it were dead, yet ſhall it live.

The cauſe by its own energy ſhall turn upon the force that oppreſſes it, and ſting to deſtruction the vulnerable heel that endeavours to keep it down."

Another important tranſaction, of which the new counſellors were for the firſt time apprized at their arrival in India, gave further ſcope to their ſyſtem of policy. In the ſolemn treaty of peace, concluded Auguſt 1765, at Illahabad, between the nabob vizier of Oude and the Eaſt-India company, it is ſtipulated, that the Mogul emperor, Sha Allum, ſhall remain under the guarantee of the company in full poſſeſſion of the provinces of Corah and Illahabad, as a royal demeſne; in conſideration of which the dewannee or ſovereignty of Bengal was granted by the Mogul emperor in perpetuity to the company. About the year 1772, the emperor, who had hitherto reſided at Illahabad, removed to his ancient capital of Dehli; but unhappily engaging in unſucceſsful hoſtilities with the Mahrattas, this people compelled him, while in their power, to grant ſunnuds for the ſurrender of Corah and Illahabad to them. But Mr. Haſtings, in his letter of March 1773 to the court of directors, ſays, "In no ſhape can this compulſatory ceſſion by the Mogul king, releaſe us from the obligation we are under to defend the provinces which we have ſo particularly guaranteed to him;" and they were accordingly occupied by the troops of the company, and taken under its immediate protection. In a ſhort time, however, the ideas of Mr. Haſtings ſuffered a total change; for by an act of the governor and council, paſſed in June following, the engagements between the company and the emperor are declared to be diſſolved, by his alienation from them and their intereſts, manifeſted by his removal to Dehli. Nevertheleſs, "if the Mogul king ſhould make overtures to renew his former connection, his right to reclaim the diſtricts of Corah and Illahabad could not (ſay they) be diſputed; and the governor is authoriſed to reſtore them to him, on condition that he ſhould renounce his claim to the annual tribute of twenty-ſix lacks of rupees, reſerved to the emperor out of the revenues of Bengal, and to the arrears which might be due." Yet, in the treaty concluded in perſon by the governor-general with the vizier of Oude, in September 1773, it is aſſerted, "That his Mogul majeſty having abandoned the diſtricts of Corah and Illahabad, and given a ſunnud for Corah and Currah to the Mahrattas, had thereby forfeited his right to the ſaid diſtricts." And in his ſubſequent report of this interview and negociation with the vizier Sujah ul Dowla, the governor declared, "That the adminiſtration would have been culpable in the higheſt degree for retaining poſſeſſion of Corah and Illahabad, for any other purpoſe than that of making an advantage by the diſpoſal of them, and therefore he had ceded them to the vizier for fifty lacks of rupees; the nett annual revenue of theſe provinces being eſtimated at twenty-five lacks." At the ſame time the governor and council determined to withhold the tribute of twenty-ſix lacks of rupees from the emperor, pretending "That they were not ſatisfied of his amicable intentions, and that the reduced ſtate of their treaſury rendered ſuch payment impracticable." Such was the unaccountable treatment which the emperor of Hindooſtan received from the ſervants of a foreign mercantile company; although Mr. Haſtings himſelf, in a minute recorded in the council-book on another occaſion, declared, "That fallen as the houſe of Timur is, it is yet the relic of the moſt illuſtrious line of the eaſtern world; that its ſovereignty is univerſally acknowledged, though the ſubſtance of it no longer exiſts; and that the company itſelf derives its conſtitutional dominion from its oſtenſible bounty."

The Mahratta ſtates are the only people of Hindooſtan who were not ſubdued by the Moguls, or who never acknowledged allegiance to the houſe of Timur. Secure amidſt their inacceſſible mountains, they preſerved, unimpaired, their liberty and independency, and were at all times regarded by the moſt powerful of the Mahomedan emperors as very formidable adverſaries. This nation conſiſted of a number of diſtinct tribes, governed by their reſpective chieftains, but who all recognized, as their ſupreme head, a prince ſtyled the Sou, or Ram Rajah, i. e. the great rajah, whoſe throne was eſtabliſhed at Setterah. Since the decline of the Mogul power, that of the Mahrattas had riſen rapidly on its ruins. At this period their dominions extended from Travancore, near the ſouthern extremity of the peninſula, to the province of Guzzerat, northward, divided from the Perſian territories by the river Paddar, the Jumna ſeparating them from the empire of the Mogul. To the eaſt they ſtretch to the Carnatic and the dominions of the Nizam of the Decan, the province of Catac carrying their poſſeſſions irregularly acroſs the peninſula to the bay of Bengal. Their revenues were computed to amount to more than twelve millions ſterling; and their military eſtabliſhment, which was compoſed chiefly of cavalry, to three hundred thouſand men. It is a ſingular circumſtance in this government, that the ſovereignty of the Sou or Ram Rajah exiſt, at this day, only in name. Nana Row, peiſhwa or prime miniſter of the country, at a period not very remote, ſeizing the perſon of the rajah, confined him in a fortreſs near Setterah; and, uſurping the powers of the government, continued to adminiſter them in the name of the ſovereign. Nana Row, dying, left the ſucceſſion to his ſon Mada Row, who finding a rival in the perſon of Ragonaut Row, his uncle, a man of an intriguing diſpoſition and moſt flagitious character, kept him in cloſe confinement till near the time of his own death; when, being deſirous to enſure the quiet ſucceſſion of the peiſhwaſhip to his brother Narrain Row, he became reconciled to Ragonaut, in conſequence of the moſt ſolemn promiſes of the latter to aſſiſt the young Narrain Row with his moſt tender care, protection, and advice. The credulous Mada Row ſhed tears of joy and ſatisfaction at this happy event, and cloſed his eyes in peace. But the vile and unnatural wretch, thus generouſly liberated, immediately engaged in new plots againſt his nephew Narrain; and in a few months after his acceſſion, September 1773, the young peiſhwa was aſſaſſinated by the villainous contrivance of his uncle, who expected to have ſucceeded without difficulty to the government. But the horror and deteſtation excited by a crime of this enormous magnitude, occaſioned an oppoſition ſo general, that the parricide Ragonaut was compelled to fly his country. Unhappily he directed his courſe to the iſland of Bombay, the government of which not only granted him, without heſitation, their protection, but, affecting to admit the validity of his claims, they commenced open hoſtilities againſt the Mahrattas, indulging the moſt ambitious and ſanguine hopes, if the reſtoration of Ragonaut Row could be accompliſhed by their aid, to rival Madras and Calcutta in opulence and power.

The iſland of Salſette, and the city of Baroach, were quickly reduced by the valour of the company's troops; but it does not appear that at this period the preſidency of Bombay received any encouragement from Mr. Haſtings to proſecute theſe projects of aggrandiſement. On the contrary, the governor joined with the new counſellors, Clavering, Monſon, and Francis, in reprobating theſe proceedings; declaring by an act of council, paſſed May 1775, that the meaſures adopted by the preſidency of Bombay had a tendency to a very extenſive and indefinite ſcene of troubles; and that their conduct was unſeaſonable, impolitic, unjuſt, and unauthorized. And availing themſelves of the ſuperiority veſted in them as conſtituting the ſupreme power in India, colonel Upton was ſent on an embaſſy to the Mahratta court, for the purpoſe of negociating a peace, which was concluded at Poonah, and ratified March 1, 1776, upon terms honourable and advantageous. By this treaty Salſette, Baroach, and various adjoining diſtricts in the Guzzerat provinces, were ceded to the company, and the ſum of twelve lacks of rupees allotted to them as an indemnification for the expences of the war. On the other hand, it was ſtipulated

that

that Ragonaut Row ſhould withdraw from Bombay, and that no protection or aſſiſtance ſhould be granted to him or any other ſubject of the Mahratta ſtate, who may cauſe any diſturbance or rebellion in that country. Notwithſtanding the ſolemnity of this engagement, Ragonaut Row ſtill continued at Bombay, and by means of his agents fomented parties and diſſenſions in the court of Poonah, until the Mahratta government, jealous in the higheſt degree of the deſigns of the Engliſh, were provoked to receive with marked diſtinction the chevalier de St. Lubin, ambaſſador from the French preſidency of Pondicherry. This event brought on the ſubſequent ſtruggles betwixt the Engliſh and French in India.

On the 28th of January, 1778, the governor introduced this ſubject at the ſupreme board. "If report could be believed, (ſaid Mr. Haſtings,) written engagements had paſſed between the Mahratta court and M. St. Lubin, the object of which, whatever it be, muſt, if attempted, prove deſtructive to the Britiſh trade and influence in India. Although the Mahratta power, unallied with other ſtates, was unable to cope with the company, yet, ſuſtained by the French, they are qualified to refuſe acquieſcence with our demands, which demands the iſland of Baſſeen offers as the only proſpect of a ſecurity; that no obligation precludes us from demanding it, nor can any blame be imputed to us, if, as the ſuperior power, we preſcribe the terms of accommodation." In addition to this demand, Mr. Haſtings, in the plan ſubſequently laid by him before the board, required "that the Mahratta government give ſuch ſecurity for the perſonal ſafety of Ragonaut Row as he himſelf ſhall require; that a ſpecific ſum be demanded to reimburſe the company for their late military charges; that a grant of territory be made contiguous to Baſſeen; and that no European ſettlement be allowed on the Mahratta coaſts without conſent of the company." At the ſame time he communicated a plan formed by the preſidency of Bombay, to reinſtate Ragonaut Row in the peiſhwaſhip by force of arms, being invited to this enterpriſe by ſundry members of the Mahratta government.

After much oppoſition from Mr. Francis and Mr. Wheeler, who had recently ſucceeded ſir John Clavering as a member of the board, the governor's propoſals were carried in council by his own caſting vote; and it was finally determined to ſupport Ragonaut Row, in the event of the infraction of the Poonah or Poorunder treaty, as now explained: aſſerting that "the preſidency of Bengal was in a condition to aſſiſt Bombay abundantly with men and money to carry on the Mahratta war," Mr. Haſtings propoſed to march a large detachment of the company's troops acroſs the peninſula, for the purpoſe of reinforcing the Bombay army. This alſo being carried in the ſame manner, the deſtined reinforcement, under colonel Leſlie, commenced this unprecedented march of eleven hundred miles, early in May, 1778. In order to promote and corroborate the ſucceſs of this project, Mr. Haſtings had moſt aſſiduouſly courted the friendſhip and alliance of the rajah of Berar, Moodajee Booſla, whoſe dominions occupied the intermediate ſpace between thoſe of the company and of the Mahratta ſtates, inciting and urging that prince, who was far advanced in years, and of a mild and pacific diſpoſition, openly to avow his claim to the ſovereignty of the Mahrattas, to which the rajah had ſome obſcure and remote pretenſions. Moodajee Booſla, however, was ſo far from being willing to embark his fortunes in this new war, that he abſolutely declined to take any part in it.

Colonel Leſlie, who commanded the army on its march to Bombay, dying, October, 1778, was ſucceeded by colonel Goddard. This able officer, after ſurmounting great and various obſtacles, reached the ſouthern banks of the Narbudda, within the territory of Berar, January, 1779; and immediately detached lieutenant Wetherſtone to the court of Naigpore, again to urge the rajah's acceſſion to the propoſed plan of operation. But the lieutenant, in his letters to colonel Goddard, declares, that Moodajee Booſla, and the government of Berar, were determined not to take any active part whatever with the company's armies; that they had a thouſand arguments to oppoſe to thoſe he urged in favour of the plan for aſſuming the dignity of ram rajah of Setterah, particularly the faith pledged, and the alliance of friendſhip they had ſworn to, with the preſent peiſhwa; that the aſſerting their pretenſions to the ſovereignty would meet with numberleſs oppoſitions; and that ſucceſs could not be obtained without ſhedding much blood, and at the expence of violating the ſacred engagements before entered into with them. Mr. Wetherſtone further ſays, "that it ſeemed now to be the firſt wiſh of the court of Berar to ſet aſide our connection with Ragonaut Row, the ſupporting of whom they aſſerted to be highly impolitical, and that in the end it would be fully proved ſo; that this chief, Ragonaut Row, was held in univerſal abhorrence; and that the prejudices againſt him in the decan would not eaſily, if ever, be removed. And the rajah earneſtly offered his mediation to make up all the exiſting differences."

About this period, likewiſe, letters were received by the governor-general from Siccaram Pundit, prime miniſter of the Poonah government, containing heavy complaints of the conduct of the Engliſh ſince the concluſion of the treaty of Poorunder. "The government of Bombay from that period has, in every inſtance, (he aſſerts,) excited troubles and commotions, in violation of the ties of friendſhip; and notwithſtanding the expreſs ſtipulation to expel Ragonaut Row from the dominions of the company, they have performed nothing thereof. Out of regard to the friendſhip and alliance of the company, I call God to witneſs, that the envoy of France was diſmiſſed without negociating with him. It is mutually incumbent upon us to obſerve the terms of the treaty." And again, in a ſubſequent diſpatch, the ſame miniſter ſays, "Notwithſtanding the concluſion of the treaty, the Bombay government kept Ragonaut Row with them. It even appears to a conviction, that they perſuaded Ragoba, i.e. Ragonaut Row, to the meaſures he has purſued. How then does the ſupreme authority of the council of Calcutta from the king of England appear, ſince the chiefs of the different ſettlements do not regard engagements made by you as binding on them? And you, ſir, paying no regard to your own acts, take your meaſures on the repreſentations of the government of Bombay. This is indeed aſtoniſhing to the higheſt degree! It is the dictate of ſound policy, that you withdraw your troops to your own territory. This will be a convincing proof of the ſincerity of your friendſhip, and will ſpread the fame of your good faith throughout the univerſe. From the commencement of the government of the family of the peiſhwa, they have entered into treaties with many of the chiefs of the eaſt and weſt, and have never before experienced ſuch a want of faith from any one."

In the mean time, pending theſe negociations and the march of the Bengal army, the preſidency of Bombay, poſſeſſed with high ideas of their own ſtrength, confident of ſucceſs, and jealous, leſt, by the arrival of the expected reinforcements, they ſhould be obliged to divide the ſpoil and profit of the expedition into the Mahratta country, with thoſe of whoſe aſſiſtance they ſtood in no need, having made all the previous military preparations, and formally declared the treaty of Poorunder void, put their troops in motion, November, 1778. The event of this expedition cannot be better related than in the words of Row Ghee, reſident at the court of Poonah from the nabob of Arcot: "The Engliſh ſurdars, (ſays this intelligent obſerver, in a letter to the nabob,) with an army conſiſting of ſeven hundred Europeans, eight battalions of ſepoys, and forty pieces of cannon, marched from Bombay to the paſſes. Siccaram Pundit and Nana Furneſe joined their forces, and ſatisfied the diſcontented chiefs, Scindia and Holkar, by giving them money, jaghires, and other preſents. All the chiefs having met to conſult, agreed unanimouſly not to receive Ragonaut Row, ſince he came with an army of Engliſh, who were of a different nation

from them, and whoſe conduct in Sujah Dowla's country, the Rohilla country, Bengal, and the Carnatic, they were well acquainted with. Otherwiſe, in the end, they would be obliged to forſake their religion, and become the ſlaves of Europeans." Upon this they exchanged oaths, and a great army was ſent to occupy the Ghaut, or paſs of Tullicanoon. Mr. Martyn, the Bombay reſident at Poonah, had encouraged the Engliſh to believe, that as ſoon as their army ſhould arrive at the Ghaut, Holkar would join them with all his forces. The Engliſh, truſting to this, waited there with impatience for a whole month, but no one appeared to join their ſtandard. They then marched forward, although much haraſſed by the Mahrattas, who at length completely cut off their ſupplies of proviſions.

The Engliſh then determined upon retreating back to the Ghaut; but Siccaram, gaining intelligence of their march, detached a large body of troops to intercept them. An obſtinate engagement enſued on the 13th of January, 1799, in which the Engliſh, being ſurrounded and overpowered, loſt two hundred Europeans and twelve hundred ſepoys. No poſſibility of eſcape now remained; and on the renewal of hoſtilities on the 15th, by a heavy cannonade from the Mahrattas, a gentleman, Mr. Farmer, advancing from the Engliſh camp, the firing ceaſed. The chiefs of the Mahrattas ſent for him into their preſence, and Mr. Farmer addreſſed them in the following words: "We are only merchants—when diſputes prevailed with you, Ragonauf Row came to us, and demanded our protection. We thought he had a right to the government, and gave him our aſſiſtance. Nothing but ill fortune attends him, and we have been brought to this miſerable ſtate by keeping him with us. You are maſters to keep him from us. We ſhall henceforth adhere to the treaties that have formerly taken place between us; be pleaſed to forgive what has happened." The miniſter anſwered, "Ragonaut Row is one of us—what right could you have to interfere in our concerns with him? We now deſire you to give up Salſette and Baſſeen, and what other countries you have poſſeſſed yourſelves of. Adhere to the treaty made in the time of Bajalee Row, in September, 1761, and aſk nothing elſe."

Next day at noon Mr. Farmer returned, and told Scindia "that he had brought a blank paper, ſigned and ſealed, which the Mahratta chiefs will fill up as they pleaſed." Scindia told the chiefs, "that although they had it in their power to make any demands they pleaſed, it would not be adviſable to do it at this time. For our making large demands would only ſow reſentment in their hearts, and we had better demand only what is neceſſary. Let Ragonaut Row be with us; let Salſette and the pergunnahs in Guzzerat be reſtored; let the Bengal army return back." Theſe articles being wrote out on paper, in Perſian, Mahratta, and Engliſh, ſealed with the company's ſeal, were ſigned at Worgaum, by general Carnac and ſeven officers. Hoſtages were given for the due performance of them. After this the Mahratta ſurdars ſent them victuals, which they needed much. The Engliſh and ſepoys, grounding their arms, marched out, eſcorted by two thouſand Mahratta horſe.

Intelligence of this diſaſtrous event having reached Calcutta, Mr. Haſtings declared in council, that general Goddard, in caſe of the failure of the Poonah expedition from Bombay, had his expreſs orders to recur to his negociations with Moodajee Booſla, which implied his return to Berar. But that officer, regardleſs of that inſtruction, proceeded by forced marches to Surat, agreeably to the requiſition of the preſidency of Bombay. This government, in their diſpatches to the ſupreme council, after ſtating the defeat of their army, have the effrontery to ſay, "that they did not think themſelves obligated by the conditions of the ſubſequent treaty; but that, having intentions to enter into another, they had tranſmitted directions to general Goddard accordingly." Mr. Haſtings expreſſed his approbation of the tenor of this diſpatch, and, declaring "that the treaty, being made by perſons unauthoriſed to ſubſcribe to ſuch conditions, was invalid; propoſed that general Goddard be commiſſioned to negociate at the court of Poonah for the renewal of the treaty of Poorunder; and that the preſidency of Bombay be required to prepare for ſervice, whether offenſive or defenſive."

Mr. Francis entered in the council-book his reaſons for diſſenting from the governor-general. He admitted "the probability, that peace might be obtained on the terms of the treaty of Poorunder, provided this government be itſelf in earneſt in purſuit of its preſent object, and ſuffered not itſelf to be entangled in the deſperate ſchemes of thoſe who conſtitute the government of Bombay. The re-eſtabliſhment of peace on the Malabar coaſt, I deem, (ſaid this able counſellor,) to be eſſential, not merely to the proſperity of the India company, but to their exiſtence. Let a war upon that coaſt be conducted how it may, the difference between conqueſt and defeat, in my judgment, is little more than the delay or acceleration of the ruin of all our reſources. The annexed account ſhews that, during the laſt five years, they have received little leſs than 116 lacks of current rupees directly out of the revenues of Bengal. Yet their bond-debt accumulated daily, and now amounts to thirty-eight lacks. By the month of October, the preſident Hornby ſays, their finances will be utterly exhauſted; in the interval they will want a ſupply of thirty lacks. Of this ſum the preſident propoſes to borrow twenty lacks, but doubts the poſſibility of raiſing ſo large a ſum; and if it could be borrowed, he ſays, they have no funds to pay the intereſt. We ſhould therefore conſider how long we can maintain a war on ſuch a footing, before we engage in it." To this the governor-general was pleaſed to declare, "that, from his anxiety to avoid controverſy, he ſhould decline any reply."

A letter was then read by the governor, in anſwer to the diſpatches from Bombay, which, though ſtrongly objected to by Mr. Francis and Mr. Wheeler, received the ſanction of Mr. Barwell, and of ſir Eyre Coote, who had now taken his place at the board as commander-in-chief of the company's forces. In this letter the governor, in name of himſelf and council, acquaints the preſidency of Bombay, "that the government of Bengal refuſes to ratify even the ſmalleſt tittle of the treaty or convention of Worgaum; that general Goddard was inveſted with full powers to conclude a pacification with the court of Poonah, on the terms preſcribed in his inſtructions; and that, if the Mahratta miniſters ſhall reject thoſe propoſals, and the company be reduced to the neceſſity of defending its rights by an open war, a latitude of action is left to general Goddard, to avail himſelf of the ſituation which fortune ſhall preſent to him. Mr. Haſtings, in order to enforce the general ſyſtem of policy contained in this letter, moreover declared to the council, "that he never would ſuffer the object to be loſt, for which the detachment now commanded by general Goddard was firſt appointed." This paſſed in the month of June, 1779; and by a letter from general Goddard, dated October following, the governor and council were informed, as they had every reaſon to expect, "that the peiſhwa's miniſter had, in plain and poſitive terms, declared to him that his maſter would not accede to the propoſals made by general Goddard, or conclude peace with the Engliſh, unleſs Ragonaut Row, who had eſcaped, was delivered up to him, and Salſette ſurrendered to the Mahratta government; that, in conſequence of this declaration, general Goddard had broken off the negociation, and prepared for war." As was predicted by Mr. Francis, the whole Mahratta race, including the rajah of Berar, together with Hyder Ally Khan, and the nizam or ſubah of the Decan, in the higheſt degree exaſperated, now reſolved, with the aſſiſtance of the French, to endeavour to expel the Engliſh nation from India.

In the progreſs of the war, the government of Bengal ſoon found itſelf reduced to the extremeſt neceſſity for money to defray the enormous expence of its complex

and extended operations. Caſting his eyes around, the governor-general at length fixed them on the territory of Benares, a province depending on the vizierate of Oude, highly cultivated and populous, and the capital city of which, ſituated on the Ganges, has for ages been regarded by the Hindoos as a place of peculiar and indelible ſanctity, as the ſeat and centre of their ſcience, their laws, their philoſophy, and religion. The late rajah of Benares, Bulwant Sing, during the wars between the vizier and the company, had zealouſly attached himſelf to the Engliſh intereſt; and the court of directors, in their letter of May 26, 1768, acknowledge "the ſignal ſervices he had rendered them; and they expreſs their hope, that the attention paid to thoſe who have eſpouſed their intereſts in this war will reſtore their reputation in Hindooſtan, and that the Indian powers will be convinced that no breach of treaty will ever have their ſanction."

Two years after this, Bulwant Sing died, leaving the ſucceſſion to his ſon, Cheyt Sing; and the council of Calcutta, Mr. Cartier being then preſident, interpoſed their influence and authority at the court of Lucknow, in order to procure from the vizier juſt and reaſonable terms of ſettlement. It was finally agreed, that the rajah ſhould pay to the vizier a peſhcuſh, or fine, equivalent to about 200,000l. and that an annual advance of 30,000l. ſhould be made to the ſtated tribute. A ſolemn deed of confirmation was then paſſed by the vizier, and the rajah was inveſted with the government, amid the loud acclamations of a numerous and happy people. In 1773, at the immediate inſtance of Mr. Haſtings, this grant was anew confirmed and ratified by the vizier, with the additional and expreſs proviſion, that no increaſe of tribute ſhall ever hereafter be demanded; and that the government of Benares ſhall deſcend, on the terms of this agreement, to the heirs of the preſent rajah.

The governor-general, knowing the enmity which had long ſubſiſted between the vizier and the late rajah, declared himſelf "to be well convinced that the rajah's inheritance, and perhaps his life, are no longer ſafe than while he enjoys the company's protection, which is his due by the ties of juſtice, and the obligations of public faith." In the following year, 1774, the governor-general and council obtained the aſſignment of the ſovereignty paramount of the province of Benares, by treaty with the nabob vizier of Oude, "without any encroachment (to adopt the words of the act of council) on the juſt rights of the rajah, or the engagements actually ſubſiſting with him." And at the expreſs recommendation of Mr. Haſtings, by a new grant, further privileges were conferred upon the rajah, viz. the ſovereignty of the mint, and the rights of criminal juſtice in the laſt reſort; the governor, in the record of this tranſaction in the council-book, making uſe of theſe remarkable words: "The rajah of Benares, from the ſituation of his country, which is a frontier to the provinces of Oude and Bahar, may be made a ſerviceable ally to the company; but, to inſure his attachment, his intereſt muſt be connected with it, which cannot be better effected than by freeing him totally from the remains of his preſent vaſſalage, under the guarantee and protection of the company; and, at the ſame time, guarding him againſt any apprehenſions from this government, by thus pledging its faith, that no encroachment ſhall ever be made on his rights by the company." Such were, at this period, the good-will and generoſity of Mr. Haſtings, that he propoſed to receive the tribute of the rajah, amounting to 260,000l. per ann. punctually and cheerfully paid in monthly aſſeſſments; not at Benares, but at Patna, the neareſt provincial ſtation, "leſt the preſence of a reſident ſhould in any manner fruſtrate the intention of rendering the rajah independent; eventually reducing him (as Mr. Haſtings's ſolicitude apprehended) to the mean and depraved ſtate of a mere zemindar." Amongſt the preſents privately received by Mr. Haſtings, on this occaſion, as he acknowledges, was the ſum of 23,000l. or two lacks of rupees, from the rajah Cheyt Sing.

In this ſtate things remained till, in the year 1777, the rajah had the misfortune to give great offence to the governor-general; an offence, however, unintentional, but for which his final ruin only could atone. In order to comprehend the nature of his delinquency, it is neceſſary to obſerve, that in the courſe of the preceding year, 1776, Mr. Haſtings had, in his private and confidential correſpondence, authoriſed Mr. Maclean, his agent in England, to ſignify to the court of directors his deſire to reſign his office, and to requeſt their nomination of a ſucceſſor to the vacancy which would be thereby occaſioned in the ſupreme council. The court, after appointing a committee to examine into the powers veſted in Mr. Maclean, unanimouſly reſolved to accept the ſaid reſignation, and named Mr. Wheeler to fill the vacancy occaſioned by the ſame. A regular notification of this acceptance was immediately tranſmitted to India, and the diſpatches were read in council, June 19, 1777. Mr. Haſtings obſerving a profound ſilence on the ſubject of theſe diſpatches, general Clavering addreſſed a letter to him on the following day, containing a formal requiſition to the governor-general, to ſurrender the keys of Fort William, and of the company's treaſury. But Mr. Haſtings, affecting ſurpriſe and indignation, peremptorily refuſed to comply with this demand; denying that his office was vacant; aſſerting that Mr. Maclean had exceeded his powers, and declaring his reſolution to maintain his authority by every legal means. General Clavering, on the contrary, conceiving the office to be irrevocably vacated, and that he himſelf had legally ſucceeded to the government, iſſued ſummonſes to the other members of the council, Mr. Barwell, and Mr. Francis, and in the preſence of Mr. Francis, took the oaths as governor-general. On the other hand, Mr. Haſtings, ſupported by Mr. Barwell, iſſued directions to the commandant of the garriſon of Fort William, to the provincial councils, and to the officers on the different military ſtations, enjoining them, at their peril, to obey no orders but ſuch as ſhould be ſigned by him, or a majority of his council. Sir John Clavering, perceiving that Mr. Haſtings was determined rather to riſk a civil war than to reſign the government, propoſed a reference to the ſupreme court of judicature; to which Mr. Haſtings, confiding in the *known integrity* of ſir Elijah Impey, readily conſenting, a deciſion was given in favour of Mr. Haſtings.

But this judicial confirmation of his authority, by no means ſatisfied Mr. Haſtings. Omitting, therefore, to ſummon ſir John Clavering and Mr. Francis to the next meeting of council, the governor, ſupported only by Mr. Barwell, entered in the council-book a formal reſolve, importing, "that general Clavering having uſurped the preſidency of Bengal, had thereby relinquiſhed and vacated the office of ſenior counſellor and commander-in-chief of the company's forces; and that, for the preſervation of the legality of their proceedings, the ſaid general Clavering be not in future ſummoned or admitted as a member of the council." This reſolve was notified to ſir John Clavering, and iſſued in general orders to the officers civil and military of the three provinces. At the enſuing meeting of council, Mr. Francis moved the reverſal of theſe proceedings; but Mr. Haſtings declared his determination to adhere to them, ſaying, "That they were not the precipitate effects of an inſtant and paſſionate impulſe, but the fruits of long and temperate deliberation, and of the ſtricteſt ſenſe of public duty." The chief-juſtice Impey, however, having his reaſons for declining to ſupport the governor in *this* exerciſe of his public duty, Mr. Haſtings thought proper to move a ſubſequent reſolution in council, conformably to the advice of the judges, "That all parties be replaced in the ſame ſituation in which they ſtood before the receipt of the laſt advices from England."

Thus

Thus terminated this extraordinary buſineſs; but, moſt unfortunately for the rajah Cheyt Sing, on the firſt intelligence of general Clavering's advancement to the government, he had, with officious complaiſance, deputed a vakeel, or ambaſſador, to congratulate the new governor on his acceſſion. This, Mr. Haſtings, in his ſubſequent juſtification, urges as a preſumptive proof of the rajah's diſaffection to the Engliſh government; and the affront thus offered to him appears to have rankled in his boſom, till he found a fit opportunity for gratifying his revenge. Conſcious of his uncontroulable power, the governor propoſed in council, July 9th, 1778, ſir John Clavering being deceaſed, "That the rajah of Benares ſhould conſent to the eſtabliſhment of three battalions of ſepoys, to be raiſed and maintained at his own expence;" and, notwithſtanding the alarm of the rajah at the firſt intimation of this deſign, and the vigorous oppoſition of Mr. Francis and Mr. Wheeler, the reſolve was carried into effect by the caſting vote of the governor. The ſum of five lacks of rupees, which was ſuppoſed to be equivalent to the expence of raiſing the three battalions, was demanded of the rajah to be paid in ſpecie within five days; and in caſe of non-compliance, the reſident, Fowke, was peremptorily enjoined to refrain from all further intercourſe with him. The affrighted rajah paid the money without delay or heſitation. But the ſame demand being renewed the following year, he ventured to remind the governor, in a moſt reſpectful letter, "that he was encouraged to believe the former demand would not be drawn into precedent. I am therefore hopeful, (ſaid he,) you will be kindly pleaſed to excuſe me the five lacks now demanded, and that nothing may be demanded of me beyond the amount expreſſed in the pottah." In reply to this ſubmiſſive application, the governor repeated his demand, that the rajah ſhould, without evaſion or delay, pay the five lacks of rupees; in caſe of his refuſal, informing him that meaſures would be taken to oblige him to a compliance. The third year, the ſame demand being made, the rajah again entreated a remiſſion, but without effect; and as a puniſhment for his continued contumacy, the governor-general, of his own authority, impoſed upon him an additional fine or mulct of 10,000l. Theſe outrages failing to produce the effect intended on the mild and timid temper of the rajah, a ſudden demand was made, in addition to the tribute and ſubſidy, to provide a body of two thouſand cavalry for the ſervice of the company. It was in vain that the rajah proteſted he had no more than thirteen hundred horſe in his ſervice; five hundred of which, and five hundred burkundaſſes, or match-lock men, ſhould be ready to march to whatever place they ſhould be ordered. Mr. Haſtings gave no anſwer whatever to this repreſentation; but declared, "that he was determined to convert the faults of the rajah into a public benefit; that he would exact the ſum of 500,000l. as a puniſhment for his breach of engagements, and other acts of miſconduct; and that if the rajah ſhould refuſe the demand, he would deprive him of his government."

Mr. Barwell and Mr. Francis having by this time returned to England, and Mr. Wheeler only remaining in council, the ſole reſponſibility of the government centered in Mr. Haſtings. For the purpoſe of executing more effectually theſe preconcerted deſigns, the governor determined upon a journey to Benares; previous to which he veſted in himſelf, by a formal act, the entire powers of the ſupreme council. At the eve of his departure, however, he informed Mr. Wheeler, "that the offences of the rajah required puniſhment; and, *as his wealth was great*, and the company's exigencies preſſing, it was a meaſure of policy and juſtice to exact from him a large pecuniary mulct for their relief." On the entrance of the governor-general into the province, he was met by the rajah in perſon, with a magnificent attendance. Nevertheleſs, to ſhew his confidence in the juſtice of the governor, he entered alone the pinnace in which the governor had proceeded up the Ganges, and, in a lowly and ſuppliant manner, putting his turban in his lap, entreated his favour. He was, however, repulſed with contempt; and on the arrival of the governor at Benares, he received an injunction from Mr. Haſtings, not to enter his preſence without his permiſſion.

On the ſucceeding day, the governor ſent articles of accuſation in writing to the rajah, importing, 1. That he had endeavoured to excite diſorders in the government on which he depended. 2. That he had ſuffered with impunity the perpetration of robberies and murders, even in the ſtreets of Benares, to the great and public ſcandal of the Engliſh name. 3. That he had delayed the payment of the ſums required of him for the company's ſervice; and, 4. That he had not complied with the demand of cavalry: all of which amounted, as the governor aſſerted, to a direct charge of diſaffection to the government on which the rajah depended; and to theſe articles of impeachment he demanded an immediate anſwer. On the evening of the ſame day, the rajah ſent in his defence, denying, in the moſt poſitive manner, the truth of the aforeſaid articles: "My enemies, (ſaid he,) with a view to my ruin, have made falſe repreſentations to you. Now that, happily for me, you have yourſelf arrived at this place, you will be able to aſcertain all the circumſtances. 1. Relative to the horſe. 2. To my people going to Calcutta. 3. The dates of the receipts of the particular ſums above-mentioned. I have never ſwerved in the ſmalleſt degree from my duty to you. It remains with you to decide on all theſe matters. I am in every thing your ſlave. What is juſt I have repreſented to you. May your proſperity increaſe!" At this reply the governor expreſſed great wrath, declaring it to be leſs a vindication of the rajah than a recrimination on him; and that it was couched in terms of defiance, manifeſting a dangerous ſpirit of independency.

In conſequence of the rajah's offenſive conduct, Mr. Haſtings conceived himſelf obliged to adopt ſome deciſive plan; and an order was therefore immediately iſſued to put the rajah under an arreſt in his own palace. To this indignity the rajah, ſhocked as he appeared to be, ſubmitted with the moſt paſſive humility. "He hoped, (he ſaid,) that the governor would allow him a ſubſiſtence in conſideration of his father's ſervices; but as for his zemindary, his forts, and his treaſures, he was ready to lay them at his feet, and his life, if required." Being at once dejected with the ignominy, and diſmayed with the danger of his ſituation, ſurrounded by a guard of ſepoys with their ſwords drawn, he wrote to the governor, "Whatever be your pleaſure, do it with your own hands. I am your ſlave. What occaſion can there be for a guard? It depends on you alone to take away, or not to take away, the country out of my hands." The higheſt alarm being excited in the city of Benares, by this arreſt of the rajah, great numbers of people aſſembled round the palace, nor could the earneſt and repeated entreaties of their prince reſtrain them from acts of violence; and believing the perſon of the rajah, who was much beloved by his ſubjects, to be expoſed to extreme hazard, they at length broke through the incloſure, and falling ſuddenly upon the guard of ſepoys and Engliſh officers, nearly the whole were cut to pieces. In the tumult the rajah made his eſcape over the walls of his palace by means of a cord formed of turbans tied together; and, croſſing the Ganges in a boat, fled to a place of refuge, whence he directed a ſuppliant letter to Mr. Haſtings, to which the governor affirmed "he did not think it becoming him to reply."

The troops in the province of Benares being quickly reinforced, the territories of the rajah were immediately attacked, and completely reduced. The rajah having himſelf made his eſcape to the camp of the Mahrattas, orders were given by Mr. Haſtings to ſeize upon the fortreſs of Bidjegur, the reſidence of the Rannee Pauna, mother of Cheyt Sing, repreſented as a woman ſingularly amiable

amiable and virtuous, and againſt whom no delinquency was even pretended. The treaſures of the Rannee being very conſiderable, ſhe was deſirous to capitulate upon conditions, in order to ſave ſomething from the wreck of her fortunes. But Mr. Haſtings wrote to the commander, major Popham, "I think every demand the Rannee has made to you, except that of ſafety and reſpect for her perſon, unreaſonable. I apprehend that ſhe will contrive to defraud the captors of a conſiderable part of the booty, by being ſuffered to retire without examination. But this is your conſideration, and not mine. As to making any conditions with her for a proviſion, I will never conſent to it." In a ſecond letter he ſays, "If ſhe delays the ſurrender beyond the term of twenty-four hours, it is my poſitive injunction that you put a ſtop to the negociation, and on no account renew it: nor will I grant her any conditions whatever; but leave her expoſed to thoſe dangers ſhe has choſen to riſk, rather than truſt to the clemency and generoſity of our government." The caſtle being accordingly ſurrendered within the time ſpecified, the articles of the capitulation, by which an allowance of fifteen per cent. was reſerved to the Rannee, were nevertheleſs ſhamefully and outrageouſly broken, the perſon of the Rannee and her attendants groſsly inſulted, and their effects plundered. Notwithſtanding the efforts and repreſentations of major Popham, the commander, a man of humanity and honour, no redreſs was obtained from the governor, who, now wholly intent upon the vindication of his conduct, had cauſed a great number of affidavits and depoſitions, aiming to prove the exiſtence of a conſpiracy againſt the Engliſh government, to be taken by ſir Elijah Impey, who *happened* at this time, in the courſe of an excurſion for the benefit of his health, to be fortunately reſident at Benares.

In his ſubſequent narrative of this tranſaction to the court of directors, Mr. Haſtings heſitated not to aſſert, "that the rajah of Benares had no claim to the title or privileges of a prince; that the deeds which paſſed between him and the board, upon the transfer of the zemindary, in 1775, were not to be underſtood to bear the quality and force of a treaty between equal ſtates; that the payments to be made by him were not a tribute, but a rent; that, being nothing more than a common zemindar, he owed a perſonal allegiance, and an implicit and unreſerved obedience, to the authority of the company, at the forfeiture of his zemindary, and even of his life and property." Yet, perhaps, the records of hiſtory do not exhibit a poſition more enormouſly extravagant, than that the ſovereign of a province in the interior parts of Hindooſtan, exerciſing the powers of government over a happy and conſenting people, ſhould owe implicit and unreſerved obedience to a company of traders inhabiting an iſland on the other ſide of the globe!

After the depoſition of the rajah Cheyt Sing, Mr. Haſtings, in virtue of the commiſſion with which he had inveſted himſelf, inſtantly exerciſed the ſovereign authority over the province of Benares. Setting aſide all former agreements, though evidently made with the rajahs not in their perſonal but political capacity, he increaſed the tribute, or ſtated rent-charge, from 260,000l. to 400,000l. per annum. Having beſtowed the government on a youth, called Mehip Narrain, a deſcendent by the mother from the rajah Bulwant Sing; he, in addition to the tribute, impoſed ſuch heavy and grievous duties on merchandize, as threatened the abſolute annihilation of their commerce; charging moreover penſions on the revenues of the province, and ſending large bodies of troops into the territory of Benares, to be maintained by the oppreſſed and impoveriſhed inhabitants. The father of the new rajah, Durbitzee Sing, who was appointed guardian and adminiſtrator to his ſon, was by Mr. Haſtings, in a ſhort time, depoſed from his office, on a vague and indefinite charge of mal-adminiſtration and deficiency in his payments, and thrown into priſon. His property being confiſcated, and his perſon endangered, he in a ſhort time died, overwhelmed with diſtreſs and ruin.

"When a new ſyſtem was to be formed with the ſucceſſor of Cheyt Sing, (ſays Mr. Haſtings,) I ſaw no objection to making the company's intereſts my firſt principle of action. The eaſy accumulation of too much wealth had been Cheyt Sing's ruin. It had buoyed him up with extravagant and ill-founded notions of independency, which I much wiſhed to diſcourage in the future rajah. Some part, therefore, of the ſuperabundant produce of the country, I turned into the coffers of the company, by an augmentation of the tribute." Here the grand object of the Britiſh government in India, as adminiſtered by Mr. Haſtings, is undiſguiſedly avowed: the filling the company's coffers with money, was by him held to be the firſt principle of action. Happy would it indeed have been for the inhabitants of Hindooſtan, if even this principle had been purſued by rational and politic means, ſuch as would have ſecured, unimpaired, the ſources of proſperity, though for the mere purpoſe of ſubſequent emolument.

The treaty concluded in 1765 with the vizier Sujah ul Dowla, nabob of Oude, by the late lord Clive, left that province in a conſiderable meaſure dependent upon the company. From this period the decay and deſolation of the vizierate commenced. The annual revenue, which was eſtimated at more than three millions, had ſunk, in 1779, to leſs than one million and a half. The vizier had contracted to maintain, at his own expence, a brigade of the company's troops in his ſervice, for ſo long time as he might deem them neceſſary for the defence of his country. But the court of directors, in their letter to the governor and council, of the 15th of December, 1775, expreſsly ſay, "If you intend to exert your influence, firſt to induce the vizier to acquieſce in your propoſal, and afterwards to compel him to keep the troops in his pay during your pleaſure, your intents are unjuſt, and a correſpondent conduct would reflect great diſhonour on the company." In the mean while, the nabob Aſoph ul Dowla, who had ſucceeded his father in the vizierate, February, 1775, making very earneſt ſupplication to be relieved from this burden, which the reduced ſtate of his revenue rendered him utterly unable to ſupport; Mr. Haſtings declared, "the relief deſired was totally inadmiſſible;" further affirming, "that the tone in which the demands of the nabob were aſſerted, gave cauſe for the moſt alarming ſuſpicions;" though it is difficult to conceive how language more ſubmiſſive and humble could have been adopted.

"During three years, (ſays the nabob,) the expence occaſioned by the troops in brigade, and others commanded by European officers, has much diſtreſſed the ſupport of my houſehold, inſomuch that the allowances made to the ſeraglio and children of the deceaſed nabob, have been reduced to one-fourth of what it had been. The attendants and ſervants of my court have received no pay for two years paſt, and applications from my father's private creditors are daily preſſing upon me. All theſe difficulties I have for three years ſtruggled through, and found this conſolation therein, that it was complying with the pleaſure of the honourable company, and in the hope that the ſupreme council would make enquiry, from impartial perſons, into my diſtreſſed ſituation: but I am now forced to a repreſentation. From the great increaſe of expence, the revenues were neceſſarily farmed out at a high rate, and deficiencies have followed yearly, till the whole country and cultivation is abandoned."

In 1781, a commiſſion of delegation having been executed at Calcutta, inveſting Mr. Haſtings with the entire powers of the ſupreme council, the governor-general reſolved to viſit the province in perſon. At a meeting which took place at Chunar, on the confines of Benares, a ſecret treaty was concluded by the governor with the vizier, containing ſeveral articles of a very extraordinary nature. By this the claims upon the nabob, on various

grounds and pretences, aroſe to the enormous ſum of 2,785,000l. ſterling, which was conſiderably more than two years net produce of the nabob's revenues. In order to liquidate this debt, Mr. Haſtings urged the nabob, and an article to this effect was inſerted in the treaty of Chunar, to a general reſumption of the jaghires, or government aſſignments upon land, throughout the province, to the amount of many hundred thouſand pounds annual rent, including the proviſions made by the former nabob-viziers for their princes of the blood, and the ancient friends and dependents of their family. The eſtates thus confiſcated were re-let on rack-rents, and at the ſame time mortgaged to rich bankers of Benares, to ſupply the immediate wants of the Engliſh government. A *gift* from the vizier of 100,000l. ſterling was alſo at this period accepted by Mr. Haſtings; which being, as he confeſſed, a ſum of too great magnitude to be concealed, he, after ſome deliberation, thought proper to apprize the court of directors of this violation of their commands; but he nevertheleſs had to expreſs his hope, "that, in conſideration of his long and faithful ſervices, and the ſums he had expended from his private fortune upon their account, they would permit him to apply this donation to his own uſe."

The confuſion and diſtreſs conſequent on the late violent expedition of reſumption, and other devices of extortion, it is impoſſible in adequate terms to deſcribe. The regular authority of the magiſtracy, and the adminiſtration of juſtice, totally ceaſed; and no power was viſible but that of the farmers of the revenue, attended by bodies of troops, to enforce the collections. The country was declared, by one of the nabob's miniſters, to be "a ſpeaking picture of famine and woe."—"From the total want of police, (ſays the reſident, Briſtow,) hardly a day eſcapes but I am informed of ſome tragical event, whereof the bare recital is ſhocking to humanity:" and he confeſſes that his feelings are ſenſibly hurt, and his compaſſion ſtrongly excited, by the diſgraceful and miſerable ſtate of poverty to which the brothers of the nabob are reduced. From three of theſe princes, Mirza Ali, Mirza Hyder, and Mirza Sief, the reſident received an affecting memorial, in which they ſay, "Our ſituation is not fit to be told: for two years we have not received an hubba on account of our tuncaw (aſſignment on the revenue). It is ſurpriſing, having ſuch a friend as you, our ſituation is arrived at that paſs that we ſhould be in diſtreſs for bread and clothing—yet we are the ſons of Sujah ul Dowla!"

The mother and wife of the late nabob kept their court at the city of Fyzabad, where, after the cuſtom of the eaſt, they lived in much magnificence, having the charge of educating the numerous offspring of the deceaſed ſovereign, and of maintaining a houſehold conſiſting of two thouſand perſons. To ſupport this vaſt expence, the nabob had left them a large proportion of his treaſures, and had ſettled upon them jaghires, or permanent revenues, ſuitable to their high rank and dignity, and to the importance of the truſt committed to them; ſolemnly and earneſtly recommending at the ſame time the intereſts of his family to the guardian care and protection of the company, by whom their poſſeſſions had been ſubſequently and authentically guaranteed. By the treaty of Chunar, nevertheleſs, the preſent nabob was authorized by Mr. Haſtings to ſeize upon the jaghires, or landed revenues, of theſe illuſtrious relatives, and to allow them penſions equal to the amount. And this, the governor pretended, was conformable to the Mahommedan law. The nabob appearing, nevertheleſs, manifeſtly reluctant to carry this project into execution, Mr. Haſtings ſignified his pleaſure to his own reſident at Lucknow, Mr. Middleton, "that as this meaſure originated with the Engliſh, and was intended for their benefit, the execution was to be forced upon him;" although the expreſs words of the treaty of Chunar were merely, "that the nabob be permitted to reſume ſuch jaghires, or eſtates, as he may think neceſſary."

In order to impart ſome colour of juſtice to theſe proceedings, depoſitions the moſt futile and ridiculous were, as at Benares, extra-judicially made before ſir Elijah Impey, who unexpectedly preſented himſelf in the courſe of his progreſs, after leaving Benares, firſt at Chunar, then at Lucknow. For this magiſtrate ſo highly degraded his character and ſtation, as to become a principal agent in this buſineſs. And ſuch was the ſilent celerity of his movements, that the chief-juſtice has been, with humourous alluſion, compared to the ghoſt in Hamlet, exclaiming, in almoſt every quarter at the ſame inſtant, "Swear!" Theſe affidavits, founded on vague rumours, were deſigned to prove, that the princeſſes of Oude fomented the inſurrection at Benares, and were even engaged in a plot for the dethronement of their own ſon, and the utter extirpation of the Engliſh nation. Very little ſtreſs, however, was at this criſis placed by Mr. Haſtings on the validity of theſe proofs, which were evidently calculated to anſwer a different and diſtant purpoſe. "Your pleaſure, (ſays Mr. Middleton,) reſpecting the begums, I have learnt from ſir Elijah Impey. Finding the nabob wavering in his determination about the reſumption of the jaghires, I this day ordered the neceſſary perwannahs for that purpoſe. But before they were tranſcribed, I received a meſſage from the nabob, entreating that I would withhold them till the morning. As it is poſſible that the nabob, ſeeing the buſineſs will at all events be done, may make it an act of his own, I have conſented to indulge him in this requeſt." The nabob at length iſſued his perwannahs, but with extreme reluctance, and, to uſe the language of Mr. Middleton, "after much trifling evaſion and puerile excuſes;" the irreſiſtible effuſions, no doubt, of that natural affection which it is ſo difficult totally to eradicate from the human heart. "At the ſame time the nabob declared, (ſays Mr. Middleton,) both to me and his miniſters, that it was an act of compulſion."

In a ſubſequent letter, Mr. Middleton informs the governor, that the vizier, wiſhing to evade the meaſure of reſumption, ſuggeſted to him, that the debt of the company might be better and more expeditiouſly liquidated by taking the amount at once from the treaſures left by his father. Mr. Haſtings, now, ſtill inſiſting upon the reſumption of the jaghires, declared his reſolution *alſo to ſeize the treaſures*; enjoining upon the agent, Middleton, the execution of this nefarious act, in the following peremptory terms: "You yourſelf muſt be perſonally preſent. You muſt not allow any negociation or forbearance, but muſt proſecute both ſervices until the Begums are at the entire mercy of the nabob." In conformity to this order, the Britiſh reſident, at the head of a body of troops, accompanied by the terrified vizier, marched to Fyzabad, and with little or no reſiſtance ſtormed firſt the town, and then the caſtle. The chief officers of the houſehold, the eunuchs Jewar Ali Khan and Bahar Ali Khan, perſons of diſtinguiſhed rank, who had been in high truſt and favour with the late nabob, were ignominiouſly thruſt into confinement, in order to extort from them the diſcovery of the treaſures and effects committed to their care. In conſequence of theſe ſeverities, the *bhow begum*, i. e. the mother princeſs, at length conſented to the ſurrender of her treaſures, hid in the moſt ſecret receſſes of the palace, to the amount of the bond debt due from the nabob to the company. But avarice is inſatiable as the grave! Another demand of 120,000l. was made for the balance pretended to be due ſince the execution of the bond; and to enforce compliance, the two eunuchs were, by order of the reſident, Middleton, committed to cloſe cuſtody, put in irons, and kept from all food. To raiſe this ſum, great part of the furniture of the palaces, the jewels, and other effects of the begums, even to the wardrobe, were diſpoſed of by public ſale.

Fully appriſed of the diſtreſsful ſituation of the princeſſes, Mr. Haſtings could, nevertheleſs, write at this period to the reſident, Middleton, as follows: "The nabob having

having conſented to the reſumption of the jaghires held by the begums, and to the confiſcation of their treaſures, and thereby involved my own name, and the credit of the company, in a participation of both meaſures, I have a right to require and inſiſt on the complete execution of them, and I look to you for their execution, declaring that I hold you accountable for it." Mr. Haſtings, in his defence, alleged, that he was ignorant of many tranſactions imputed to him reſpecting this buſineſs. But of thoſe which were in any degree material, he could *not*, with truth, plead ignorance. "If Mr. Middleton did not give him an exact account of the groans that were heaved, the tears that were ſhed, the weight of the fetters, or the depth of the dungeon, he ſtated (ſays Mr. Sheridan, vide his ſpeech, June, 1788,) every important ſtep that was taken in the progreſs and winding up of this relentleſs tragedy." In fact, nothing of moment was done without the expreſs command of Mr. Haſtings; for even Mr. Middleton diſcovered no ſymptoms of alacrity in the execution of this direful commiſſion.

It may eaſily be imagined, that the penſions allotted to the begums, and other jagheerdars, in lieu of their jaghires, would be very ill and defectively paid. In the month of March, 1782, the officer on duty at Fyzabad, major Gilpin, wrote to the reſident: "The women belonging to the *khord mohul*, or leſſer palace, are in want of every neceſſary of life; and are driven to that deſperation, that they threaten to throw themſelves from the walls of the zenana." In a ſubſequent letter it is ſaid, "The women in the zenana aſſembled laſt night on the tops of the building, crying in a moſt lamentable manner for food." And in a third letter, "The repeated cries of the women for ſubſiſtence have been truly melancholy. They beg moſt piteouſly for liberty, that they may earn their daily bread by ſervitude, or to be releaſed from their miſery by immediate death." At length the company's reſident, Mr. Briſtow, ventured, of his own authority, to order the removal of the troops, and the releaſe of the priſoners, Bahar and Jewar Ali Khan, who had now been confined and in irons for near twelve months. "The quivering lips, (ſays the commander of the troops at Fyzabad, ſpeaking of their enlargement,) and the tears of joy ſtealing down the poor mens' cheeks, was a ſcene truly affecting." The diſtreſſes of the zenana, or ſeraglio, nevertheleſs, ſtill continued; and the women, breaking by frantic violence the ſacred bounds of the palace, exhibited themſelves in this ſtate of degradation and deſpair to the aſtoniſhed inhabitants of Fyzabad, in the public bazar, or market-place, of that great and populous city. But after this act of deſperation, they do not appear to have been permitted to ſuffer equal extremity.

In a letter from the bhow begum to the reſident, Briſtow, this unfortunate princeſs ſays, "An accuſation was framed againſt me, which I had never conceived even in idea, of rendering aſſiſtance to rajah Cheyt Sing. Having ſeized my head eunuchs, Jewar Ali Khan and Bahar Ali Khan, they obliged them to ſign a bond for ſixty lacks of rupees. They were thrown into priſon with fetters about their feet, and denied food and water. I, who had never even in my dreams experienced ſuch an oppreſſion, gave up all I had to preſerve my honour and dignity. My ſufferings did not terminate here. The diſturbances of colonel Hannay and Mr. Gordon were made a pretence for ſeizing my jaghire. The ſtate of the matter is this: When colonel Hannay was by Mr. Haſtings ordered to march to Benares, during the troubles of Cheyt Sing, the colonel, who had plundered the whole country, was incapable of proceeding from the union of thouſands of zemindars, who had ſeized this favourable opportunity. They haraſſed Mr. Gordon near Junivard, and oppoſed his march. Mr. Gordon forded the river upon his elephant. In the mean time a letter was received by me from colonel Hannay, deſiring me to eſcort Mr. Gordon to Fyzabad. As my friendſhip for the Engliſh was always ſincere, I readily complied, and ſent ſome companies of Nejeebs to eſcort Mr. Gordon and all his effects to Fyzabad; where, having provided for his entertainment, I effected his junction with colonel Hannay. The letters of thanks I received from both theſe gentlemen are ſtill in my poſſeſſion. But is it not extraordinary, that notwithſtanding the juſtneſs of my cauſe, nobody relieves my misfortunes?"

In the letter of colonel Hannay, referred to by the begum, that officer, in the oriental phraſeology, ſays: "Begum Saib of exalted dignity! Your exalting letter, fraught with grace and benevolence, I had the honour to receive in a fortunate moment. Your faithful ſervant repoſeth his moſt unbounded hopes and expectation upon your highneſs, that Mr. Gordon may arrive at Fyzabad without apprehenſion or danger." And Mr. Gordon expreſſes himſelf in a ſtill higher ſtrain of reſpect and gratitude: "Begum Saib of exalted dignity and generoſity! Your gracious letter, in anſwer to the petition of your ſervant from Goondah, exalted me. The welfare of your ſervant is entirely owing to your favour and benevolence. Continue to exalt and honour me with your gracious letters. May the ſun of proſperity continually ſhine!"

When the intelligence of theſe aſtoniſhing tranſactions reached the court of directors, that aſſembly ordered a letter to be written to the governor and council, in which they ſay, with reference to the iniquitous and enormous plan of ſeizure and reſumption, "We hope and truſt, for the honour of the Britiſh nation, that this meaſure appeared fully juſtified in the eyes of all Hindooſtan. It no where appears, from the papers at preſent in our poſſeſſion, that they, the begums, excited any commotions previous to the impriſonment of Cheyt Sing; and only armed themſelves in conſequence of that tranſaction; and it is probable, that ſuch a conduct proceeded from motives of ſelf-defence, under an apprehenſion that they themſelves might likewiſe be laid under unwarrantable contributions." And the court expreſsly ordered an enquiry to be inſtituted into this matter, and, if the charge proved to be unfounded, that their jaghires ſhould be reſtored. But this requiſition was never complied with.

On the departure of Mr. Francis from India early in 1781, Mr. Haſtings, upon whom the entire powers of government devolved, immediately diſſolved the provincial councils, and eſtabliſhed a committee of revenue, with powers in the higheſt degree deſpotic. The general renewal of leaſes coming under the conſideration of this board, they determined, "that as to the period of the leaſes, it appeared beſt to the committee to limit them to one year." In this reſpect the committee of revenue were leſs lenient than the famous committee of circuit. And they acted in direct contradiction to the former opinion of Mr. Haſtings, who then ſolemnly declared, "that the farmer, i.e. the government leſſee, who holds his farm for one year only, having no intereſt in the next, takes what he can with the hand of rigour: he will be tempted to exceed the bounds of right, and to augment his income by irregular exactions, and by racking the tenants, for which pretences will not be wanting where the farms paſs annually from one hand to another. On the contrary, from long leaſes the farmer acquires a permanent intereſt in his lands: he will, for his own ſake, lay out money in aſſiſting his tenants, in improving lands already cultivated, and in clearing and cultivating waſte lands." All the evils ſo clearly foreſeen, and ſo little regarded, added to thoſe ariſing from the groſſeſt peculation, took place under this new ſyſtem; the chief adminiſtrator and manager of which was one Govind Sing, a wretch loaded (as Mr. Haſtings himſelf acknowledged) with reproaches, and of whom it ſtands upon record, "that there was ſcarcely a family of rank in the three provinces whom he had not ſome time or another diſtreſſed and afflicted—ſcarcely a zemindary that he had not diſmembered and plundered."

During the long adminiſtration of Mr. Haſtings, va-

rious

rious momentous incidents occurred in the ſubordinate departments of government in India; but of theſe a curſory mention can only be made. Mahomed Ali Khan, nabob of Arcot, had, by means too obvious to need explanation, acquired an unbounded influence over the counſels of the government of Madras. Supported by the aid and authority of that preſidency, under the expreſs ſanction of the governor and council of Bengal, the nabob, on frivolous pretences, declared war againſt the rajah of Tanjore, a neighbouring prince and ancient ally of the company; and, ſeizing his dominions, annexed them to his own territory. The court of directors, highly indignant at this unjuſt and violent uſurpation, determined upon the reſtoration of the rajah: and for this purpoſe lord Pigot, a nobleman who had formerly been employed in the Indian ſervice, and whoſe character, both in a civil and military capacity, ſtood deſervedly high, was appointed to the government with poſitive orders to that effect. His lordſhip arrived at Madras the latter end of the year 1775; and, notwithſtanding all the oppoſition and the temptation thrown in his way, he accompliſhed the grand object of his appointment in the re-inſtatement of the rajah. Diſputes running extremely high in the council in conſequence of this meaſure, the governor, in the autumn of 1776, ſuſpended two of the members from their functions, by a doubtful and dangerous aſſumption of authority. But ample revenge was ſoon after taken by the remaining malcontents, in the arreſt and impriſonment of his lordſhip, who ſurvived this daring outrage but a very ſhort time. In the ſeſſion of Parliament which began November 1778, Admiral Pigot, brother to lord Pigot, brought this affair in all its circumſtances before the houſe of commons; and after ſtating, in a ſeries of reſolutions, the principal facts relative to this cataſtrophe, he concluded with moving an addreſs to his majeſty, "humbly praying, that George Stratton, eſq. and the other members of the council of Madras, be proſecuted for ordering their governor and commander in chief to be arreſted, and confined under a military force—they being returned to England, and now within the juriſdiction of his majeſty's courts of Weſtminſter-hall." Notwithſtanding the laboured juſtification of Mr. Stratton, who was a member of the houſe, theſe reſolutions were unanimouſly carried. Theſe gentlemen, being in the ſequel tried and convicted in the court of king's-bench, were, to the amazement of the public, ſentenced only to pay a trifling fine.

At this period the war in India had become very general; a moſt formidable combination of the country powers in oppoſition to the Engliſh had taken place, which, aſſiſted by the fleets and armies of France, ſeemed to menace the very exiſtence of the empire of Britain in India. Hyder Ali, the ancient and inveterate enemy of the company, in July, 1780, broke into the Carnatic with a vaſt army, and committed the moſt dreadful ravages. On the 10th of September, he attacked and ſurrounded a conſiderable detached corps under colonel Baillie, which were entirely cut to pieces or made priſoners. He then attacked and made himſelf maſter of Arcot; and ſcarcely did the government at Madras believe itſelf to be in ſafety, when ſir Eyre Coote arrived to take the command of the company's forces on the coaſt of Coromandel, and Hyder was in repeated engagements foiled and defeated by this gallant veteran. Various naval encounters alſo took place between the French and Engliſh fleets, commanded by M. Suffrein and admiral ſir Edward Hughes, with equal ſkill, courage, and ſucceſs. The naval force of both nations was gradually increaſed, in the progreſs of the war, to a degree far beyond what had been known at any former period in India, amounting at the laſt, on the part of the Britiſh, to eighteen ſhips of the line of battle. But the proportion continuing nearly the ſame, the mutual acceſſions of ſtrength ſerved only to increaſe the number of human victims: and the ſucceſſive battles being obſtinately and heroically conteſted, the blood ſhed in the eaſtern world was uncommonly great.—See the article HINDOOSTAN.

The affairs of India were now become ſo alarming in England, that a ſecret committee having been appointed, in 1781, to enquire into the cauſes of the Mahratta war, and that in the Carnatic; a very able report was brought up early in the ſeſſion of 1782, by Mr. Dundas, chairman of the committee, in which the general ſyſtem of policy purſued by the governor-general Haſtings, was reprobated in terms of extreme ſeverity. Mr. Dundas, in the courſe of his ſpeech, ſaid, "that the governor had no right to fancy he was an Alexander, or an Aurengzebe; or to prefer frantic military exploits, inſtead of the improvement of the trade and commerce of the country." Sir Thomas Rumbold alſo, who had juſt relinquiſhed the government of Madras, was criminated as guilty of groſs peculation, embezzlement, and oppreſſion. General Smith, in moving that the report of the ſecret committee be referred to a committee of the houſe, took notice that ſir Elijah Impey, his majeſty's chief juſtice in India, had ſo far degraded his character and office, as to accept of a place under the company of 8000l. per annum, contrary to the ſolemn engagements under which he held his appointment. An addreſs was in conſequence preſented to the king, to beſeech his majeſty to recal ſir Elijah Impey from India to anſwer for his conduct. A bill was likewiſe brought in by Mr. Dundas, for inflicting certain pains and penalties on ſir Thomas Rumbold, for high crimes and miſdemeanours.

On the 28th of May, 1782, the houſe of commons paſſed a ſeries of reſolutions, in the moſt deciſive terms condemnatory of the whole ſyſtem of Indian politics. The laſt reſolution imported, "That Warren Haſtings, eſq. governor-general in Bengal, and William Hornby, eſq. preſident of the council at Bombay, having in ſundry inſtances acted in a manner repugnant to the honour and policy of this nation, and thereby brought great calamities on India, and enormous expences on the Eaſt-India company, it is the duty of the directors of the ſaid company, to purſue all legal and effectual means for the removal of the ſaid governor-general and preſident from their ſaid offices, and to recal them to Great Britain." This reſolution was confirmed by the court of directors, and paſſed October, 1782, in the following terms: "Reſolved, that it is the opinion of this court, that a ſteady perſeverance in the ſyſtem of conduct ſo frequently enjoined by the court of directors, cannot be expected from thoſe ſervants whoſe ideas of extenſion of dominion, either by negociation or conqueſt, have led them to depart from orders ſo often enforced; and therefore, that it is expedient to remove Warren Haſtings, eſq. from the office of governor-general of Bengal."

The war in India, in the mean while, went on with various ſucceſs. The valuable ſettlements of Negapatnam, on the Coromandel coaſt, and Trinquemale, in the iſland of Ceylon, belonging to the Dutch, were captured by the Engliſh. On the other hand, colonel Braithwaite, with a detachment of the company's troops, was totally routed on the banks of the Coleroon by Tippoo Saib, ſon of Hyder Ali, aſſiſted by a body of French troops; after which Cuddalore ſurrendered to the victors. The operations of the war on the Malabar coaſt were at the ſame time conducted by general Goddard, with a great diſplay of military ſkill and ſpirit. Invading the province of Guzzerat, in 1780, he reduced the city of Amedabad, its capital; and, on the ſecond of April, he ſtormed the camp of the Mahrattas, commanded by Madajee Scindia, whom he totally defeated. Entering into a treaty with the rana of Gohud, major Popham, by order of the general, attacked and carried, in the courſe of the ſummer, the ſtrong fortreſs of Gualior, which was garriſoned by the Mahrattas, though within the territory of the rana.

Early in 1781, general Goddard ſat down before Baſſeen; and, after reducing this important place, he deſiſted from further active operations, in conſequence of the ſuc-

cours

cours he was under a neceſſity to ſend to ſir Eyre Coote. In the province of Malva, colonel Carnac ſurpriſed, April 30, the camp of the enemy, and Madajee Scindia was a ſecond time totally routed. After this the Mahratta chieftain made ſecret overtures for a ſeparate peace; and a ceſſation of hoſtilities between England and the Mahratta ſtates took place in the month of October, 1781. The definitive articles of peace were ſigned in May following, at Salberg, by Mr. Anderſon, on the part of the company, and by Scindia, general and plenipotentiary, on the part of the peiſhwa. By this treaty Baſſeen, and the other recent acquiſitions in the Guzzerat, were reſtored to the Mahrattas, the iſland of Salſette only of the late conqueſts remaining to the Engliſh; for, at the requeſt of Madajee Scindia, the Engliſh conſented alſo to relinquiſh their claim to the city of Baroach and the contiguous diſtricts. Ragonaut Row was, by this treaty, for ever abandoned, and compelled to quit the territories of the company; and their ally, the rana of Gohud, who appears indeed without ſcruple to have oppoſed duplicity to duplicity, was, under pretext of "leaving him to ſettle his own affairs," virtually delivered up to the mercy of his enemies. But the moſt extraordinary article of the treaty was that whereby the peiſhwa engages that Hyder Ali Khan ſhall be made to relinquiſh, within ſix months, all ſuch territories belonging to the company or their allies as he ſhall have taken poſſeſſion of ſince the ninth of the month Ramzan. The fact was, that not only a treaty of peace, but of the ſtricteſt alliance and friendſhip, was now formed by the governor-general Haſtings with the Mahratta court; and a ſecret project was believed to be already in contemplation for the partition of Hyder's dominions. The nizam of the Decan and the rajah of Berar were alſo parties in this accommodation, for their acceſſion to which they received large pecuniary gratifications.

This pacification with the Mahrattas induced the preſidency of Bengal to riſque a bold attempt on the dominions of Hyder Ali on the Malabar ſide. The kingdoms of Canara and Myſore, both under ſubjection to that prince, ſtretch along the weſtern coaſt of Hindooſtan, nearly in the latitude of Arcot. The chief city of the former is Bednore, a name changed by its poſſeſſor to Hydernagore. A conſiderable force, already landed in the kingdom of Myſore, had relieved the city of Tellicherri, a poſt or factory on that coaſt belonging to the Engliſh, and reduced the neighbouring town of Calicut. It was with difficulty, nevertheleſs, that the Engliſh kept their footing in this country, when General Matthews arrived from Bombay with very large reinforcements, and immediately laid ſiege to the important fortreſs of Onore, which was carried by ſtorm on the fifth of January, 1783. At this period died Hyder Ali; who was ſucceeded by his ſon Tippoo Saib, a prince who had already given great proofs of valour and ability.

From Onore general Matthews proceeded through the *ghauts*, or paſſes of the mountains, to Hydernagore, which ſurrendered to him without reſiſtance. After this, Annampore, Carwa, and Mangalore, were ſucceſſively ſubdued; the former by ſtorm, with circumſtances of ſingular barbarity: four hundred beautiful women periſhed in the general maſſacre, under the brutal licentiouſneſs of the ſoldiery. In the mean time Tippoo prepared for the relief of Myſore and Canara; and, leaving a ſtrong force to guard his conqueſts in the Carnatic, he marched his army acroſs the peninſula with unexampled expedition, and arrived in the vicinity of Hydernagore in April, 1783. By a ſeries of manœuvres he made himſelf maſter of the ghauts in the rear of general Matthews, by which means all communication with the ſea was entirely cut off. The force of general Matthews being now centred in Hydernagore, this city was inveſted by Tippoo with a vaſt army, computed at 150,000 men, covering the hills on every ſide as far as the eye could reach. The Engliſh, reduced to extremity, were ſoon obliged to ſurrender on capitulation, by the terms of which the public treaſure was to be reſtored to the ſultan; but not a rupee being found in the fortreſs, general Matthews was charged by the conqueror with groſs colluſion, and a direct infraction of the treaty; and being conducted in chains to Seringapatam, the capital of Myſore, he was thrown into a dungeon, and, with the greater part of his officers, periſhed miſerably in confinement under various devices of cruel torture. See the article HINDOOSTAN.

Notwithſtanding the departure of Tippoo from the Carnatic, the preſidency of Madras had ſtill to cope with ſuperior force. Although the utmoſt exertions of ſir Eyre Coote had not been wanting, no deciſive advantage had been gained in the laſt campaign with Hyder; and the ill ſtate of health of this able commander obliged him to reſign the army into the hands of general Stuart, and to retire at the concluſion of 1783 to Bengal. Early in the enſuing ſpring, believing himſelf ſomewhat recovered, he returned to Madras in order to reſume his command; but two days only after his arrival, he expired in an advanced age, having acquired in more than thirty years military ſervice in India a reputation, the luſtre of which could be deemed ſcarcely inferior to that of his predeceſſor, lord Clive. The important ſettlement of Trinquemale was retaken by M. Suffrein, and a very large reinforcement of French troops landed in the Carnatic under M. de Buſſi. Notwithſtanding all oppoſition, general Stuart inveſted Cuddalore, and made conſiderable progreſs in the ſiege, when an expreſs arrived with the intelligence of a treaty of peace having been concluded between the belligerent powers, on which an immediate ceſſation of hoſtilities took place.

After the conqueſt of Hydernagore, and the recapture of the inland country by Tippoo, he laid ſiege to Mangalore, the principal place yet remaining in the hands of the Engliſh; an obſtinate reſiſtance was made by the garriſon; but a practicable breach being at length effected, a general aſſault was in contemplation, when news arrived of the pacification which had taken place in Europe; and the French troops and engineers in his ſervice informed him, that they muſt immediately withdraw their aſſiſtance. Tippoo, after much paſſionate expoſtulation, therefore aſſented to an armiſtice, in a few days after which event colonel Macleod arrived with powerful reinforcements from Bombay. A negociation was immediately commenced for a definitive peace. This was accelerated by a declaration which the ſultan received from the peiſhwa of the Mahrattas, that if Tippoo did not conſent to an immediate evacuation of the Carnatic, he would unite with the Engliſh againſt him. During the continuance of the truce and the negociation, the *bibby*, or princeſs of Cannanore, a diſtrict depending on the kingdom of Canara, having ſeized ſome boats with ſepoys belonging to the garriſon of Mangalore, accidentally forced by ſtreſs of weather on her coaſt, colonel Macleod attacked and ſtormed the fortreſs of Cannanore, making the princeſs herſelf priſoner. Although loud complaints were made by Tippoo of this violation of the armiſtice, it does not appear much to have retarded the negociation, the articles being ſigned March 11, 1784, on the terms of mutual reſtitution, and a renunciation on the part of Tippoo of his claim to the ſovereignty of the Carnatic.

In the month of March, 1783, Mr. Haſtings diſpatched his own ſecret agent, major Browne, to the court of Dehli, in order to make propoſals to the Mogul emperor Sha Allum, to enter into engagements with the company and the Mahratta government, for the accompliſhment of certain deſigns in favour of the emperor, but of a very hoſtile nature to ſeveral powers of Hindooſtan then in amity with the company. And major Browne was commiſſioned to offer to the Mogul, to provide for the entire expence of any troops the emperor might require; which propoſal was accepted with every ſymptom of eagerneſs and ſatisfaction. And the negociation being ſufficiently advanced, Mr. Haſtings brought forward a propoſition in

council, October 5, 1783, to aſſiſt the Mogul with a military force: and at a ſubſequent meeting of the board, he laid before them a letter from major Browne, dated Dehli, December 30, 1783, containing, amidſt much miſcellaneous matter, the following extraordinary paſſages: "The buſineſs of aſſiſting the ſhah can and muſt now go on, if we wiſh to be ſecure in India, and regarded as a nation. We have offered; the ſhah has accepted the offer of aſſiſtance. We have annexed conditions; the ſhah has approved of them." The project thus unexpectedly obtruded on the board by Mr. Haſtings, was very ill received by his colleagues, Mr. Wheeler and Mr. Stables, who ſtrongly remonſtrated againſt involving the company in new wars and dangerous foreign connections. But Mr. Haſtings was not to be diſcouraged by trivial obſtacles.

Early in the following year, 1784, Mr. Haſtings made a progreſs to the city of Lucknow, and there had an interview with the prince Mizra Jehander Sha, eldeſt ſon of the Mogul emperor, and who, as the governor-general in his public letter ſays, "had long held the principal part in the adminiſtration of the king his father." From Mr. Haſtings's account of this interview, which he repreſents as wholly unexpected and fortuitous, the prince having left the court of Dehli without even the knowledge of the emperor, it appears that urgent ſolicitations were made by the heir of the Mogul empire to the Engliſh governor, for aid and aſſiſtance to raiſe the king, his father, from that ſtate of degradation and inſignificance into which he had fallen: intimating his readineſs even to go in perſon to England, to repreſent the diſtreſſes of the emperor of Hindooſtan, in the hope of obtaining relief. Mr. Haſtings in reply informed the prince, "that the Engliſh nation, juſt emerged from a ſtate of univerſal warfare, required repoſe, and would be alarmed at any movement of which it could not immediately ſee the iſſue or the progreſs, but which might eventually create new hoſtilities; that as to himſelf, he could not engage, if he choſe it, in a buſineſs of this nature, without the concurrence of his colleagues in office, who, he believed, would be averſe to it; that he would, however, repreſent his ſituation to the joint members of his own government, and wait their determination. In the mean time he adviſed him to make advances to Madajee Scindia, as the effective head of the Mahratta ſtate, and who was in intimate union, and ſworn connection, with the Engliſh."

On the departure of the young prince from Dehli, Mr. Haſtings wrote to the Mahratta chief, Madajee Scindia, to apprize him of this event, and, profeſſing himſelf unprepared, to aſk his advice how to act in this emergency: and certain confidential agents from the Mahratta chief repairing to Lucknow, held frequent and ſecret conferences with the governor, the purport of which was never communicated to the board at Calcutta. This tiſſue of intrigues terminated, however, very unexpectedly, in the ſudden invaſion of the emperor's territories by the Mahrattas, who made themſelves maſters of Dehli; and the emperor, being a ſecond time priſoner in their hands, was obliged to declare the head of the Mahratta ſtate to be vicegerent of the Mogul empire; in which capacity great and indefinite claims of ſuperiority were advanced on the part of the peiſhwa, and a ſpecific claim ſet up to the tribute due to the emperor from the Engliſh at Bengal. Far from being alarmed at this addition to the Mahratta power, Mr. Haſtings declared, "that ſuch was the attachment of Scindia to the Engliſh, that, while he lives, every acceſſion of territory obtained by him will be an advantage to this government." The council, however, unable to explore the dark and unfathomable abyſs of the governor's politics, at length came to a reſolution to oppoſe them; and the governor, perceiving his influence in the council loſt, knowing his reputation at home to be in the wane, and fearing moſt probably a diſgraceful diſmiſſion, now thought it expedient to *reſign* the government. On his arrival in England, he was impeached at the bar of the houſe of lords, by the commons of Great Britain, of high crimes and miſdemeanors in the execution of his office.

We are now to revert from this long but neceſſary digreſſion, to the regular narrative of events in England. On the 13th of July, 1781, the ſeſſion was cloſed by a ſpeech, in which his majeſty obſerved, "that the great efforts made by the nation to ſurmount the difficulties of the preſent arduous and complicated war, muſt convince the world that the ancient ſpirit of the Britiſh nation was not abated or diminiſhed; and he was reſolved to accept of no terms or conditions of peace, than ſuch as might conſiſt with the honour and dignity of his crown, and the permanent intereſts and ſecurity of his people."

The military hiſtory of the preſent year was marked, in its commencement, by a ſpirited attempt on the part of the French, to capture the iſland of Jerſey by a *coup-de-main*. Early on the 16th of January, 1781, a landing was effected by the baron de Rullecourt, at the head of about eight hundred men, at the Bank du Violet; and, to the aſtoniſhment of the inhabitants, when the day began to dawn, the market-place of St. Helier was found occupied by French troops. The governor's houſe being entirely ſurrounded, he was compelled to ſurrender himſelf priſoner, and was ſo far intimidated as even to ſign articles of capitulation. But when Elizabeth-caſtle was ſummoned, captain Aylward, the commander, far from paying the leaſt regard to the acts of the governor in his preſent ſtate of durance, fired upon the French, and obliged them to retreat; and major Pierſon, a young and gallant officer, ſecond in command, having aſſembled the regular troops and militia of the iſland on the heights near the town, attacked the enemy with the greateſt reſolution and vigour. Baron Rullecourt being at the commencement of the action mortally wounded, the French troops in leſs than half an hour laid down their arms, and ſurrendered priſoners of war. Unfortunately almoſt the laſt ſhot fired, proved fatal to major Pierſon, in whoſe conduct, during the whole of this tranſaction, diſcretion and valour had been equally conſpicuous.

Early intelligence of the rupture with Holland having been tranſmitted to the Weſt Indies, admiral Rodney and general Vaughan appeared, February, 1781, with a very conſiderable naval and military force before the iſland of St. Euſtatia, that famous depoſit of wealth and mart of traffic. So little apprehenſive were the inhabitants of this event, that it was with difficulty they were brought to give credit to the ſummons. Being totally deſtitute of the means of reſiſtance, they were compelled to ſurrender at diſcretion. The ſtores and merchandize, eſtimated at three millions ſterling, were publicly ſold for the benefit of the captors. A prodigious number of trading veſſels lying in the harbour alſo became the property of the victors, with two men of war, one of which was a flag-ſhip, commanded by admiral count Byland. Nearly at the ſame time, the Dutch ſettlements of Demerara, Berbicia, and Iſſequibo, on the ſouthern main, alſo ſubmitted without reſiſtance to the arms of his Britannic majeſty.

The French fleet under count de Graſſe, after a partial engagement with admiral Hood, who in the abſence of ſir George Rodney commanded the Engliſh fleet, ſteered its courſe to the iſland of Tobago, on which M. de Bouillé, with a conſiderable land force, made an immediate deſcent. Admiral Rodney, on receiving intelligence of this attack, detached a ſquadron for the relief of the iſland, which finding the French in great force was obliged to return; and the admiral, accompanied by general Vaughan, now ſailed in perſon with the whole fleet for Tobago, off the coaſt of which he arrived the fourth of June, but had the mortification to learn that the iſland had ſurrendered on the ſecond. And at the latter end of the year, the iſland of Euſtatia was re-captured. M. de Bouillé, receiving

receiving certain intelligence of the habitual negligence of the garriſon, landed by night about four hundred troops, part of a much larger force, which the tempeſtuouſneſs of the weather had ſeparated, in a cove at the back of the iſland. This ſpirited officer, confiding in his fortune, advanced with his troops, as ſoon as day-light appeared, to the citadel, which they immediately ſtormed, and carried with little difficulty; and the ſurpriſe being very complete, near ſeven hundred men, with colonel Cockbourne, their commander, were, by a moſt humiliating neceſſity, conſtrained to ſurrender themſelves priſoners of war.

While the war was going on with various ſucceſs in America, governor Johnſtone, late one of the commiſſioners to America, was inveſted with a naval command, and with a conſiderable ſquadron was detached on an expedition to the Cape of Good Hope. The court of Verſailles, knowing the inability of the ſtates-general to protect their foreign dominions, ſent a ſuperior ſquadron under M. Suffrein to counteract the deſigns of the Engliſh; and coming up with them at Port Praya, in the iſland of St. Jago, the French admiral ſcrupled not to violate the neutrality of the Portugueſe flag, by attacking the ſquadron of commodore Johnſtone while it lay diſperſed and ſcattered, unſuſpicions of danger, in the harbour. Happily the French, rather by extraordinary efforts of valour on the part of the Britiſh ſeamen, than of ſkill on that of their commander, were beaten off; but immediately proceeding to the Cape, they effectually ſecured that important ſettlement from any hoſtile attempt. Commodore Johnſtone, on his ſubſequent arrival, was obliged to content himſelf with the capture of ſeveral Dutch Eaſt Indiamen in Saldanha bay; and thoſe of his ſhips which were deſtined for the Eaſt Indies proſecuting their voyage thither, the commodore returned home with his prizes from his lucrative expedition.

In the courſe of the ſummer of 1781, an engagement took place off the Dogger Bank, between an Engliſh ſquadron commanded by admiral Hyde Parker, and a Dutch ſquadron of equal force under admiral Zoutman, who had under convoy the Baltic trade bound to the Texel. On perceiving the Engliſh fleet bearing down, the Dutch admiral, who was to leeward, lay-to, and the Engliſh were ſuffered to approach within half muſket ſhot without firing a gun, when a dreadful cannonade commenced, which was kept up without interruption for three hours and forty minutes; and the action then ceaſed only becauſe the ſhips on both ſides, from the damages they had reſpectively ſuſtained, were no longer found manageable. The Dutch, after ſome time, bore away with their convoy for the Texel, which they reached with great difficulty, one of their largeſt ſhips ſinking before they could make the harbour. Admiral Parker, who had unavailingly applied to the admiralty for a reinforcement, returned in great diſcontent and in a ſhattered condition to the Nore, where he received the ſignal honour of a viſit from his majeſty on-board his own ſhip, and was offered knighthood as the reward of his valour. But his haughty refuſal ſhewed how little he was flattered by theſe puerile diſtinctions.

About this time the emperor of Germany, then reſident in the Netherlands, iſſued a placart, by which Oſtend was declared to be a free port; and in the month of October, 1781, he acceded in form to the armed neutrality, as the kings of Pruſſia and Portugal had alſo previouſly done. All the continental powers ſeemed fully ſenſible that England was rapidly exhauſting her ſtrength in a fruitleſs and unnatural war with her colonies; and they were all equally ſedulous to be prepared to take advantage of her weakneſs. But the bulk of the people of England were not ſo blind to their own affairs as not to be fully ſenſible that the policy of lord North's adminiſtration was tending rapidly to the ruin and diſgrace of the country; and therefore a ſtring of motions for the diſcontinuance of the American war, and for the diſmiſſion of his majeſty's miniſters, had been ſtrenuouſly followed up by the members in oppoſition. On the 19th of March, 1782, the earl of Surrey had propoſed to move a reſolution of a ſimilar import; but when his lordſhip was about to riſe, lord North addreſſed himſelf to the ſpeaker, and ſaid, "that as he underſtood the object of the noble lord's motion to be the removal of miniſters, he wiſhed to prevent the neceſſity of giving the houſe further trouble by an explicit declaration, that his majeſty had come to a determination to make an entire change of adminiſtration: and he and his colleagues only retained their official ſituation till other miniſters were appointed to occupy their places." Thus was this famous adminiſtration under lord North, which had exiſted for twelve years, ſuddenly and totally diſſolved. The marquis of Rockingham, to the univerſal ſatisfaction of the kingdom, was now a ſecond time placed at the head of the treaſury; under whom lord John Cavendiſh acted as chancellor of the exchequer; the earl of Shelburne and Mr. Fox were nominated ſecretaries of ſtate; lord Camden was appointed preſident of the council; the duke of Grafton reinſtated as lord privy ſeal; admiral Keppel, now created lord Keppel, placed at the head of the admiralty; general Conway, of the army; the duke of Richmond, of the ordnance. The duke of Portland ſucceeded lord Carliſle as lord-lieutenant of Ireland; Mr. Burke was conſtituted paymaſter of the forces; and colonel Barré, treaſurer of the navy. Lord Thurlow, by the unanimous conſent of the new miniſters, continued in poſſeſſion of the great ſeal.

The firſt act of the new adminiſtration was to ſignify its abhorrence of the war, and by every honourable means to ſtop the further effuſion of human blood. Negociations for a general peace were almoſt immediately commenced between France and Great Britain, and Mr. Grenville was ſent to Paris, inveſted with full powers to treat for that purpoſe with all the belligerent powers.

Previous to the change of adminiſtration, ſir Henry Clinton had reſigned to ſir Guy Carleton his command in America, which he had held ſince the reſignation of ſir William Howe in the ſpring of 1778. Inſtructions were now ſent to the new commander, and admiral Digby, to acquaint the congreſs of the pacific views of the Engliſh court, and of their readineſs to treat on the baſis of American independence; for the event of which ſee the article AMERICA, vol. i. p. 465.

On the 15th of April, a meſſage was delivered to the houſe by Mr. Fox from the king, ſtating, "That his majeſty, taking into conſideration the ſupplies which have been given with ſo much liberality, and ſupported by ſuch uncommon firmneſs and fortitude by his people in the preſent extenſive war, recommended to his faithful commons the conſideration of an effectual plan of economy throughout all the branches of the public expenditure." An addreſs of thanks was then moved for, and immediately agreed to by the houſe; and in conſequence of this meſſage, Mr. Burke's reform bill was a third time brought forward, and finally paſſed. By this bill the board of trade, and the board of works, with the great wardrobe, were aboliſhed; together with the office of American ſecretary of ſtate, the offices of treaſurer of the chamber, cofferer of the houſehold, the lords of police in Scotland, the paymaſter of the penſions, the maſter of the harriers, the maſter of the ſtag-hounds, and ſix clerks of the board of green cloth. Proviſion alſo was made to enable his majeſty to borrow a ſum for the liquidation of a new arrear of three hundred thouſand pounds, by a tax on ſalaries and penſions; a debt to this amount having been contracted by the prodigality of the late miniſters, notwithſtanding the addition of one hundred thouſand pounds per annum, recently made to the civil liſt.

On the 3d of May, 1782, after a debate of ſome length, it was reſolved by the houſe of commons, "That all the declarations, orders, and reſolutions, of that houſe, reſpecting the election of John Wilkes, eſq. be expunged from the journals of the houſe, as ſubverſive of the rights

of the whole body of electors in the kingdom." Mr. Wilkes, in a public letter addreſſed to his conſtituents, "congratulated them on the ſignal reparation they had now obtained for their violated franchiſes, and the injuries they had ſuſtained under the former adminiſtration."

The new miniſtry, though compoſed of diſſonant and jarring materials, conducted public affairs with at leaſt the appearance of perfect and cordial unanimity, until the death of the marquis of Rockingham, July 1, 1782, in the meridian of his age, and at the very height of his political reputation; the weight and influence attached to which, combined with the excellence of his private character, and the mild benignity of his manners, formed that power of attraction which held together the new miniſterial ſyſtem; and when this ceaſed to operate, diſorder, confuſion, and mutual repulſion, took place. On the very day ſucceeding the deceaſe of the marquis of Rockingham, the earl of Shelburne was declared firſt lord of the treaſury. The acceptance of this high office, without any previous communication with his colleagues in adminiſtration, was conſidered by the Rockingham party as equivalent to a declaration of political hoſtility on the part of lord Shelburne. On this promotion, therefore, Mr. Fox reſigned the ſeals as ſecretary of the northern department; lord John Cavendiſh his office as chancellor of the exchequer; the duke of Portland his government of Ireland; lord Althrop, lord Duncannon, Mr. Frederic Montague, &c. their ſeats at the boards of treaſury and admiralty; and Mr. Burke his poſt of paymaſter of the army. In conſequence of theſe reſignations and removes, the ſeals of the ſouthern department were given to the earl of Grantham; and of the northern to Mr. Thomas Townſhend, late ſecretary at war; ſir George Young ſucceeded Mr. Townſhend; colonel Barré was made paymaſter of the forces; and the lord advocate of Scotland, in his room, treaſurer of the navy. The earl of Temple, eldeſt ſon of the late George Grenville, ſucceeded the duke of Portland in the lord lieutenancy of Ireland; but the promotion which attracted moſt of the public attention was that of Mr. William Pitt, who, at the age of three-and-twenty, was conſtituted chancellor of the exchequer, ; an office which had been always ſuppoſed to require, in order to its proper diſcharge, not ſo much brilliancy of talents, as long previous ſtudy and experience, and confirmed habitudes of diligence and induſtry in accounts.

On the 11th of July, 1782, the ſeſſion terminated, under which the new adminiſtration had been formed and reformed; and the ſpeech from the throne contained the welcome declaration, "that nothing could be more repugnant to his majeſty's feelings, than the long continuance of ſo complicated a war; and that his ardent deſire of peace had induced him to take every meaſure which promiſed the ſpeedieſt accompliſhment of his wiſhes."

The military events of the year yet remain to be narrated. The fortreſs of Gibraltar had continued to be cloſely inveſted by the Spaniards; and the reſolute defence of the garriſon began to attract the attention of Europe. Towards the cloſe of 1781, by a moſt ſpirited and ſucceſsful ſortie, the ſtupendous works erected by the Spaniards acroſs the iſthmus which connects the rock of Gibraltar with the Spaniſh main, were ſtormed and almoſt totally demoliſhed, when, after immenſe expence and labour, they had arrived at the higheſt ſtate of perfection. In leſs than half an hour five batteries, with all the lines of approach, communication, and traverſe, were in flames; the magazines blowing up one after another as the conflagration ſucceſſively reached them; the aſtoniſhed Spaniards offering no other reſiſtance, than a diſtant and ill-directed fire from the forts of St. Philip and St. Barbara.

To balance this ſucceſs, intelligence arrived early in the ſpring of 1782, that general Murray, governor of Minorca, had been compelled, after a long and vigorous reſiſtance, to ſurrender that iſland to the arms of his catholic majeſty. Formerly, the loſs of Minorca had occaſioned the downfal of an adminiſtration; but ſuch were the infinitely greater misfortunes and diſaſters of the preſent war, that this event made little impreſſion upon the public, and it was ſcarcely remarked, that no attempt whatever had been made for its relief during a ſiege of one hundred and ſeventy-one days.

The iſland of Nevis, in the Weſt Indies, alſo about the ſame time ſurrendered to the marquis de Bouillé and the count de Graſſe; by whom the moſt liberal terms were granted to the inhabitants. Eight thouſand troops, with a formidable train of artillery, were then landed on the important iſland of St. Chriſtopher. Sir Samuel Hood, who now commanded the Britiſh fleet in the Weſt Indies, made ſtrenuous efforts for its relief: and, notwithſtanding his diſparity of force, in three ſucceſſive encounters with the count de Graſſe he obtained each time the advantage, and, at length, by a dextrous manœuvre gained poſſeſſion of the enemy's anchorage in Baſſeterre Road. Admiral Hood then landed a conſiderable detachment of troops from Antigua under general Preſcot; but general Frazer, the commanding officer on the iſland, who was ſtrongly poſted on an intrenched eminence, ſent him word, "that as he had taken the trouble to come with troops to his aſſiſtance, he ſhould doubtleſs be glad of the honour of ſeeing him, but he was in no want of him or his troops." Notwithſtanding this idle vaunt, he was obliged to ſurrender the iſland on capitulation, after a ſiege of five weeks, on the 12th of February, 1782. In the ſame month, Demerara and Iſſequibo were captured by the French: alſo the iſland of Montſerrat. The loſs of the Bahamas quickly followed, being reduced by a conſiderable force under don Manuel de Cigagal, governor of the Havannah, to the obedience of the crown of Spain.

On the 19th of February, however, ſir George Rodney arrived in the Weſt Indies with a ſtrong reinforcement of ſhips from England, and reſumed the command of the fleet. Mighty preparations were now making both by the French and Spaniards, for the invaſion of Jamaica; and as the combined force of theſe powerful nations amounted to above ſixty ſail of the line, had a junction been effected, the iſland would have been irrecoverably loſt. The firſt object of the Britiſh admiral was to intercept a great convoy of troops, proviſions, and ſtores, expected from Europe: but in this he was diſappointed; the enemy found means to eſcape his vigilance, by making the iſland of Deſeada, to the northward, and keeping cloſe in ſhore under the high land of Guadaloupe and Dominique, and arrived ſafe at Fort Royale on the 21ſt of March. It was the deſign of count de Graſſe to proceed to Hiſpaniola, and join the Spaniſh admiral, don Solano, who was waiting his arrival, in order to make, in conjunction, the pre-concerted attack on Jamaica.

On the 8th of April, at day-break, the French fleet left the harbour of Fort Royale; and admiral Rodney, who had the earlieſt intelligence of their movements, inſtantly made the ſignal for a general chace. Early the next morning he came up with the enemy under Dominique, where the van of the Engliſh engaged the rear of the French, but the continued calms prevented a general or cloſe action. In the morning of the 11th a freſh breeze ſprung up, and the chace was renewed; and towards evening the headmoſt ſhips of the van gained ſo much on one or two of the enemy's ſhips, damaged in the late action, that the count de Graſſe thought it neceſſary to bear down for the purpoſe of protecting them. Sir George Rodney, who had eagerly watched for this opportunity, now manœuvred the fleet with ſuch ſkill, as to gain the windward of the enemy during the night, ſo as entirely to preclude their retreat. At ſeven in the morning of the 12th, the two fleets, being ranged in lines directly oppoſite, engaged with the greateſt fury. The French ſhips being crowded with men, the carnage was prodigious, but no viſible impreſſion was made, or material advantage gained till about noon, when ſir George Rodney

ney in the Formidable, followed by his ſeconds, the Namur and the Duke, perceiving an accidental interval which invited the attempt, bore directly with full ſail athwart the enemy's line, and ſucceſsfully broke through, about three ſhips ſhort of the centre, where the count de Graſſe commanded in the Ville de Paris. Being quickly ſupported by the remainder of his diviſion, the Engliſh commander wore round cloſe upon the enemy, and actually ſeparated their line, placing the central ſhips of the French between two fires. This bold and maſterly manœuvre proved deciſive. The French, however, continued to fight with the utmoſt bravery, and the battle laſted till ſun-ſet. The Cæſar was the firſt ſhip which ſtruck her colours, having loſt her captain, and being almoſt torn to pieces by the Britiſh fire. Soon afterwards, by ſome unfortunate accident ſhe blew up, and every ſoul on board periſhed. The Glorieux, the Hector, the Ardent, now followed the example of the Cæſar, and the Diadem went down by a ſingle broadſide. The count de Graſſe in the Ville de Paris, beſet on all ſides, ſtill held out with heroic bravery, and, though reduced to a wreck, ſeemed to prefer ſinking rather than ſtrike to any thing under a flag. At length admiral Hood, in the Barfleur, approached him juſt at ſunſet, and poured in a moſt deſtructive fire, which the count yet ſuſtained for ſome time, till, having three men only left alive and unhurt on the upper deck, he ſtruck to his gallant antagoniſt. Night only cloſed the action: the ſhattered remains of the French fleet crowded all the ſail they could make for Cape François, and in the morning they were out of ſight. Sir Samuel Hood being detached to purſue the flying enemy, came up with five ſail off Porto Rico, and captured the Jaſon and Caton ſhips of the line, and two frigates, the third with difficulty clearing the Mona paſſage. Unfortunately the fleet was becalmed for three days after the action; and ſir George Rodney did not eſcape cenſure for the previous dilatorineſs of his purſuit. Whether more might have been done, if more had been attempted, it is difficult, perhaps impoſſible, to determine. "What had been is unknown, what is appears;" and certain it is, that this was one of the moſt glorious and deciſive naval victories ever obtained by the arms of Britain in any age of the world.

For this great victory, ſir George Bridges Rodney was created a peer of Great Britain, by the title of baron Rodney, of Rodney-Stoke, in the county of Somerſet, and a perpetual annuity of two thouſand pounds annexed to the title. And the admiral received, as he well deſerved, the unanimous thanks of both houſes for his eminent ſervices.

The campaign of 1782 was deſtined to be for ever ſignalized in the annals of hiſtory, by another event not leſs glorious to the arms of Britain than the victory of ſir George Rodney. The favourite object of Spain, during the whole of this war, was the recovery of the important fortreſs of Gibraltar; and, after the reduction of Minorca, the whole ſtrength of the Spaniſh monarchy ſeemed to be directed to this purpoſe. The duc de Crillon, conqueror of Minorca, was appointed to conduct the ſiege, and, from the failure of former plans, it was reſolved to adopt an entire new mode of operation. A project was formed by the chevalier d'Arçon, and approved by the Spaniſh court, to conſtruct a number of floating batteries, on a model which it was imagined would ſecure them from being either ſunk or fired. With this view their keels and bottoms were made of an extraordinary thickneſs, and their ſides defended by a kind of rampart, compoſed of wood and cork long ſoaked in water, and including between them a large layer of wet ſand. The roof was made of a ſtrong rope-work netting, covered with wet hides, and calculated, by its ſloping poſition, to prevent the ſhells and bombs from lodging, but to glide them off into the ſea before they could produce any effect. The batteries, ten in number, were made of the hulls of large veſſels cut down for the purpoſe, and mounted with heavy braſs cannon; and, by a moſt ingenious mechaniſm, a great variety of pipes and canals perforated all the ſolid workmanſhip, in ſuch a manner, as to convey a continued ſucceſſion of water to every part of the veſſels.

The preparations were enormouſly expenſive in other reſpects: about twelve hundred pieces of heavy ordnance had been brought to the ſpot, to be employed in the different modes of attack; above eighty gun-boats and bomb-ketches were to ſecond the operations of the floating batteries, with a multitude of frigates, ſloops, and ſchooners; and the combined fleets of France and Spain, amounting to fifty ſail of the line, were to cover and ſupport the attack, while they heightened the awful grandeur of the ſcene. The Spaniards employed by land and ſea againſt the fortreſs, were eſtimated at more than one hundred thouſand men.

With this force, and by the fire of three hundred cannon, mortars, and howitzers, from the adjacent iſthmus, it was intended to attack every part of the Britiſh works at one and the ſame moment. The count d'Artois and the duc de Bourbon, the brother and couſin of the late unfortunate Louis XVI. had repaired to the Spaniſh camp, in order to witneſs the inevitable fall of Gibraltar, which had ſo long bid haughty defiance to the united powers of France and Spain.

Early on the morning of the 13th of December, the ten battering ſhips, commanded by admiral don Moreno, came to an anchor in a line parallel to the rock, at the diſtance of about 1200 yards. The ſurrounding eminences were covered with people, as though all Spain were aſſembled to behold the ſpectacle. The cannonade and bombardment on all ſides, from the iſthmus to the ſea, and the various works of the fortreſs, were tremendouſly magnificent. The prodigious and unintermitted ſhowers of red-hot balls, of bombs and carcaſſes which filled the air, exhibited a ſcene perhaps unparalleled in military hiſtory. The whole peninſula, like ſome vaſt volcano diſcharging on all ſides its burning lava, ſeemed enveloped in a ſheet of liquid fire. The battering ſquadron for many hours remained to all appearance unaffected, but about two in the afternoon the admiral's ſhip was obſerved to ſmoke, and ſoon after, that of the prince of Naſſau was obſerved to be in the ſame condition. The whole line of attack was now viſibly diſordered. At length, the day having cloſed, the two firſt ſhips appeared to be in flames, and others were beginning to kindle; and ſignals of diſtreſs were univerſally made. Captain Curtis, who commanded the Engliſh marine force in the bay, to complete the confuſion, having advanced to the attack with his gun-boats, and raked the whole line of batteries with his fire, the Spaniſh launches, which had been employed in bringing off the men, no longer dared to appear; but were compelled, after ſeveral had been ſunk in the attempt, to abandon their ſhips to the flames, and their men to the mercy of the Engliſh. The diſtreſs of the enemy was now wrought up to the higheſt pitch of calamity; and the Britiſh officers and ſeamen, ſeeing all reſiſtance at an end, nobly exerted themſelves to ſave the vanquiſhed foe; and their humanity was, at the cloſe of this memorable conflict, no leſs conſpicuous than their valour. Captain Curtis, in particular, expoſed himſelf to the moſt imminent perſonal danger; and his pinnace was almoſt in contact with one of the largeſt batteries at the moment of her exploſion, while occupied in the philanthropic work of ſaving the enemy from drowning.

In the mean time, lord Howe, who commanded the grand fleet conſiſting of thirty-four ſail of the line, was on his paſſage from Portſmouth, in order to throw ſuccours into the fortreſs. He arrived at Cape St. Vincent the 9th of October, and on the 11th he paſſed the Straits, where the combined fleets had for ſome time been ſtationed in order to intercept him; but a violent tempeſt drove them upon the Barbary coaſt, and prevented all

poſſibility of attack. The St. Michael, of ſeventy-two guns, having ſeparated from the fleet, ran on-ſhore on the rock of Gibraltar, and was taken poſſeſſion of by captain Curtis. After fully executing the purpoſe of his deſtination, lord Howe ſet ſail for England. The enemy making their appearance off Cape St. Vincent, October 20, the Britiſh admiral lay-to, in order to receive them; but they kept at ſo great a diſtance, that the cannonade, which laſted from about five in the afternoon till ten at night, did little damage; and his lordſhip, having no preſſing reaſons for renewing the fight againſt ſo ſuperior a force, continued his voyage without further moleſtation back to Portſmouth. The governor of Gibraltar, general Elliot, for his gallant and heroic defence of that fortreſs, was moſt deſervedly raiſed to the peerage by the title of baron Heathfield, and a penſion annexed to the title equal in amount to that granted to ſir George Rodney.

This was the laſt military tranſaction of importance during the continuance of the war in Europe; and thus the career of Britain, after her repeated misfortunes, terminated with great ſplendour and eclat. All the belligerent powers were now inclined to liſten to her overtures of pacification. The independence of America being virtually recognized by England, and a reſolution againſt offenſive operations having paſſed the houſe of commons, the war with the colonies was, in fact, at an end. The original purpoſe of France, that of detaching the colonies from the parent country, being accompliſhed, ſhe could have no motive to perſevere in a war, the expence of which was enormous, and the further ſucceſs uncertain. Spain, after extraordinary exertions, having failed in her grand objects, the recovery of Gibraltar and the conqueſt of Jamaica, had little reaſon to flatter herſelf that her future efforts would be more ſucceſsful; and Holland had neither the inclination or the ability to continue the war alone.

During the negociation with France and Spain, proviſional articles of pacification between Great Britain and America were ſigned on the 30th of November, 1782, by which the thirteen provinces were declared free and independent ſtates; and, by a boundary line very favourable to America, the whole country ſouthward of the lakes on both ſides of the Ohio, and eaſtward of the Miſſiſſippi, was ceded to the colonies, with a full participation of the fiſheries on the banks of Newfoundland, and the Gulf of St. Laurence. In return for which, the congreſs engaged to recommend to the ſeveral ſtates to provide for the reſtitution of the confiſcated eſtates of the loyaliſts. But this recommendation eventually proved nugatory and uſeleſs; and this wretched portion of his majeſty's American ſubjects migrated in great numbers to the inhoſpitable wilds of Nova Scotia, and the barren ſhores of the Bahamas. See the article AMERICA, vol. i. p. 465, &c.

Preliminary articles of peace were ſigned between Great Britain, France, and Spain, on the 20th of January, 1783. By this treaty Great Britain guaranteed to France the iſland of Tobago, and reſtored that of St. Lucia; alſo the ſettlements of Goree and Senegal in Africa; and the city of Pondicherry, with her other conqueſts in the eaſt, accompanied by ſome additions of territory. Laſtly, the claims of Britain reſpecting Dunkirk were expreſsly relinquiſhed; and on her part, France agreed to reſtore, Tobago excepted, all her valuable and important conqueſts in the Weſt Indies. His catholic majeſty was allowed to retain Minorca and Weſt Florida, Eaſt Florida being alſo ceded in exchange for the Bahamas. Holland having rejected the former advances of the Engliſh court towards an accommodation, it was reſolved that ſhe ſhould not eſcape with total impunity; and the Britiſh plenipotentiaries were directed to offer the reſtitution of the Dutch ſettlements in the poſſeſſion of England, with the important exception of Trincomalee, which their high mightineſſes declared they could not reconcile with the profeſſions of moderation on the part of his Britannic majeſty. On the other hand, Holland demanded an indemnification for the loſſes and expences of the war, a pretenſion which the Engliſh negociators peremptorily rejected as totally inadmiſſible.

Upon this peace lord North's famous motion of diſapprobation was brought into the houſe of commons. His lordſhip wiſhed not, however, "to ſet the negociations aſide, however derogatory of the honour and intereſt of Great Britain; nor to put thoſe who adviſed them under peril of puniſhment, how much ſoever it was deſerved." Such was the candour of the noble lord, and ſuch his indulgence to thoſe guilty of the crime of refcuing the nation from the ruin which impended over it, as the inevitable reſult of that fatal ſyſtem which had been ſo long patronized and ſupported by the noble lord. Mr. Fox now roſe, and declared "his perfect concurrence with the ſentiments expreſſed by lord North; and in ſtill more bitter terms reprobated the peace as the moſt diſaſtrous and humiliating that had ever diſgraced any country. He had been accuſed, (he ſaid,) of having formed an union with the noble lord, whoſe principles he had oppoſed for ſeveral years of his life; but the grounds of their oppoſition were removed, and he did not conceive it to be honourable to keep up animoſities for ever: He was happy at all times to have a proper opportunity to bury his reſentments, and it was the wiſh of his heart that his friendſhips ſhould never die. The American war was the ſource of his diſagreement with the noble lord; and that cauſe of enmity being now no more, it was wiſe and fit to put an end to the ill-will, the animoſity, the feuds, and the rancour, which it engendered. It was a ſatisfaction to him to apply the appellation of friend to the noble lord; he had found him honourable as an adverſary, and he had no doubt of his openneſs and ſincerity as a friend." But by a very great and reſpectable part of the houſe, this execrable *coalition*, which opened a perfectly new ſcene of things, was moſt indignantly received. Mr. Powis ſaid, "This was the age of ſtrange confederacies. The world had ſeen great and arbitrary deſpots ſtand forth the protectors of an infant republic: France and Spain had combined to eſtabliſh the riſing liberties of America; the houſe now ſurveyed the counterpart of this picture—a monſtrous coalition of oppoſite principles—the lofty aſſertor of the royal prerogative joined in alliance with the worſhippers of the majeſty of the people!

By this coalition the duke of Portland was placed at the head of the treaſury; and lord John Cavendiſh was re-appointed chancellor of the exchequer; lord North and Mr. Fox were nominated joint ſecretaries of ſtate, the firſt for the home, the latter for the foreign, department; lord Keppel, who had recently reſigned on account of his diſapprobation of the peace, was again placed at the head of the admiralty; lord Stormont was created preſident of the council; and lord Carliſle was advanced to the poſt of lord privy ſeal. The great ſeal was put into commiſſion; the chief-juſtice Loughborough, ſo diſtinguiſhed for political verſatility, being declared firſt lord commiſſioner; the earl of Northington was appointed to the government of Ireland; and Mr. Burke reinſtated in his former poſt of paymaſter of the forces. The coalition was, however, the theme of univerſal diſapprobation: all thoſe bitter and opprobrious expreſſions of contumely and reproach againſt lord North, with which the ſpeeches of Mr. Fox and Mr. Burke had been for ſo many years filled, were now recalled to the general recollection:—when lord Chatham "wiſhed that the vengeance of the nation might fall heavy upon the miniſters;—when Mr. Fox declared, "that he would purſue even to the ſcaffold the authors of the public ruin;—and when Mr. Burke affirmed, "that he had articles of impeachment actually framed againſt lord North, whom he ſtigmatized as a ſtate criminal." In ſhort, the coalition was univerſally branded as a groſs and palpable ſacrifice of every ſentiment of honour, conſiſtency, and rectitude, on the altar of private intereſt and ambition.

One

One of the moſt diſtinguiſhed meaſures of Mr. Fox and his new colleague, was the introduction of their India bill. This famous bill propoſed no leſs than to take from the directors and proprietors the entire adminiſtration, not of their territorial merely, but of their commercial affairs, and to veſt the management and direction of them in the hands of ſeven commiſſioners named in the bill, and irremovable by the crown, except in conſequence of an addreſs of either houſe of parliament. Theſe commiſſioners and directors were immediately to enter into poſſeſſion of all lands, tenements, books, records, veſſels, goods, merchandize, and ſecurities, in truſt for the company. This act, by which the charter of the company was entirely ſuperſeded, was to continue in force four years, that is, till the year after the next general election; and it was accompanied by a ſecond bill, enacting very wiſe and equitable regulations for the future government of the Britiſh territories in Hindooſtan. The aſtoniſhment excited by the diſcloſure of this plan was very great; and while it was on one ſide of the houſe extolled as a maſterpiece of genius, virtue, and ability, it was on the other reprobated as a deep and dangerous deſign, fraught with miſchief and ruin. A petition was alſo preſented from the company, repreſenting the meaſure as ſubverſive of their charter, and operating as a confiſcation of their property, without charging againſt them any ſpecific delinquency, without trial, without conviction; a proceeding contrary to the moſt ſacred privileges of Britiſh ſubjects, and praying to be heard by counſel againſt the bill. The bill, however, was carried with rapidity through all its ſtages in the houſe of commons; and on the 9th of December, 1783, Mr. Fox, attended by a numerous train of members, preſented the bill at the bar of the houſe of lords. On this occaſion, earl Temple declared, "that he was happy to embrace the firſt opportunity of entering his proteſt againſt ſo infamous a bill; againſt a ſtretch of power ſo truly alarming, and that went near to ſeize upon the moſt ineſtimable part of our conſtitution, our chartered rights." On the 17th of the ſame month it was moved, that the bill be rejected; and after a vehement debate, the motion of rejection was carried by 95 againſt 76 voices. At midnight, on the 18th of December, a royal meſſage was ſent to the coalition ſecretaries of ſtate, demanding the ſeals of their ſeveral departments; and early the next morning letters of diſmiſſion, ſigned TEMPLE, were ſent to the other members of the cabinet. In a few days after, Mr. Pitt was declared firſt lord of the treaſury and chancellor of the exchequer; which terminated the very ſhort adminiſtration of Meſſrs. Fox and North. The marquis of Carmarthen, and Mr. Thomas Townſhend, now created lord Sydney, were nominated ſecretaries of ſtate; lord Thurlow was reinſtated as lord chancellor; earl Gower, afterwards created marquis of Stafford, as preſident of the council; the duke of Rutland was conſtituted lord privy ſeal; lord Howe placed at the head of the admiralty, and the duke of Richmond of the ordnance. The earl of Northington was recalled from his government of Ireland, to which lord Temple, who had retained the ſeals of ſecretary only three days, was again deſtined to ſucceed.

On the diſmiſſion of the coalition adminiſtration, Mr. Pitt, who now took the lead, recommended the arrangement of a plan for the future government of India. For this purpoſe, Mr. Pitt, on the ſixth of July, 1784, brought in a bill founded on the general principles of one that had been rejected by the former parliament, and to which the company had now given their ſlow and reluctant aſſent. By this bill the Britiſh territories in Hindooſtan are now governed and regulated; the particulars of which may be ſeen under EAST-INDIA COMPANY, vol. iv. p. 875—883.

In the interval between the prorogation of the parliament, A. D. 1784, and its re-aſſembling in the courſe of the enſuing winter, the nation enjoyed a flattering and delightful repoſe, under the bleſſings of peace. Highly gratified with the recent change which had taken place in the adminiſtration, the people viewed with unbounded complacency and confidence the miniſter now at the head of affairs; and indulged the moſt fond and ſanguine hopes, that under his auſpices Britain would be ſoon reſtored to her former enviable ſtate of proſperity and greatneſs.

The affairs of India during the ſeſſion of 1786, occupied the chief attention of Parliament. A bill was brought in by Mr. Dundas, which with ſome oppoſition paſſed into a law, to explain and amend the act of 1784. This bill, among other regulations of inferior importance, beſtowed upon the governor general of India the high prerogative of deciding in oppoſition to the ſenſe of the majority of the council. The offices of commander in chief and governor general, were in future to be united in the ſame perſon; and earl Cornwallis, who had borne ſo conſpicuous a part in the American war, and whoſe character ſtood deſervedly high in the public eſtimation, was nominated to fill this important commiſſion.

Mr. Haſtings, the late governor-general of Bengal, arrived in England in the month of June 1785; and the ſeaſon being then far advanced, Mr. Burke gave notice of his intention to move early in the next ſeſſion for a parliamentary inveſtigation into his conduct. Accordingly, on the 17th of February 1786, Mr. Burke threw down the gauntlett, and deſiring that the reſolutions of May 28, 1782, might be read (reſolutions moved by Mr. Dundas, as chairman of the ſelect committee, declaratory of the culpability of Mr. Haſtings, and the conſequent neceſſity of his recall), declared his "deep regret, that the ſolemn and important buſineſs of that day had not been brought forward by the original mover of the reſolutions now recited. Moſt feelingly did he lament, as the unwelcome conſequence of a devolution cauſed partly by the natural demiſe of ſome, the political deceaſe of others, and in particular caſes a death to virtue and to principle, that he ſhould now remain alone engaged in the attempt to preſerve unſullied the honour and the conſiſtency of that houſe, which had fixed upon Mr. Haſtings as an object of their particular and formal accuſation, by impeachment: preparatory to which, he concluded with moving for the papers neceſſary to corroborate the charge againſt the late governor-general of India. And on the 4th of April, 1786, Mr. Burke ſolemnly roſe to impeach Warren Haſtings, eſq. of high crimes and miſdemeanors in the execution of his office, exhibiting at the ſame time nine diſtinct articles of accuſation, which in a few weeks were increaſed to the number of twenty-two.

On the 1ſt of May, Mr. Haſtings, at his own deſire, and by the indulgence of the houſe, was heard at the bar of the houſe, in this early period of the buſineſs, in his own defence: and at the farther requeſt of the accuſed, the minutes of his defence were ordered to lie on the table. But the general opinion, faintly controverted even by the friends of Mr. Haſtings, was, that the defence, thus prematurely delivered, was of no ſervice to his cauſe, and contributed in a very inadequate degree to the vindication of his character. The houſe now proceeded in the examination of evidence: and the firſt article of impeachment reſpecting the Rohilla war was brought forward on the 1ſt of June. After a very long debate, the queſtion was decided in favour of Mr. Haſtings, ayes for the impeachment 67, noes 119. Mr. Pitt gave a ſilent vote againſt the motion; but the ground on which he voted was aſcertained by a declaration he had previouſly made, when the ſubject of the Rohilla war was in a more general way diſcuſſed, "that he conſidered that tranſaction in a horrible alarming point of view; and as being ſo repugnant to every ſentiment of human nature, that nothing could juſtify it but the ſtrongeſt motives of political expediency, and the invincible principles of retributive juſtice; adding, nevertheleſs, that it would be highly inconſiſtent and abſurd to conſider Mr.

Haſtings now in the light of a culprit, for any meaſures taken by him *previouſly* to the period in which he had been nominated by act of parliament, *governor-general of India.*"

On the 13th of June, the ſecond charge, relative to the rajah of Benares, being brought forward, it was reſolved by the houſe, on a diviſion of 119 to 79 voices, "that this charge contained matter of impeachment againſt the late governor-general of Bengal." On this occaſion Mr. Pitt ſpoke in ſupport of the motion. On the 11th of July, 1786, an end was put to theſe proceedings for the preſent by a prorogation of the parliament, which was diſmiſſed with aſſurances of "the particular ſatisfaction with which the king had obſerved their diligent attention to the public buſineſs, and the meaſures they had adopted for improving the reſources of the country."

Soon after the riſing of parliament, a ſingular incident occurred which ingroſſed for a moment the attention of the public. As the king was alighting from his poſt-chariot at the garden entrance of St. James's palace, Auguſt the 2d, a woman decently dreſſed preſented a paper to his majeſty; and while he was in the act of receiving it, ſhe ſtruck with a concealed knife at his breaſt. The king happily avoided the blow by drawing back; and as ſhe was preparing to make a ſecond thruſt, one of the yeomen caught her arm, and the weapon was wrenched out of her hand. It appeared that this poor woman, whoſe name was Margaret Nicholſon, had for a long time laboured under a mental derangement; ſhe was therefore taken to a proper place of ſecurity, and maintained at the king's expence.

In September, 1786, the king was pleaſed to appoint a new committee of council, for the conſideration of all matters relating to trade and foreign plantations. Of this board the famous Charles Jenkinſon, now for his long and faithful ſervices created lord Hawkeſbury, and conſtituted chancellor of the duchy of Lancaſter, was declared preſident. Under the auſpices of this new commiſſion a treaty of commerce was ſigned between the two courts of England and France, September 26, 1786, on the liberal principles of equality and reciprocity. Its general principle was to admit the mutual importation and exportation of the commodities of each country at a very low *ad valorem* duty. About the ſame time a convention was ſigned with Spain of ſome importance, as it finally terminated the long ſubſiſting diſputes reſpecting the ſettlements of the Engliſh nation on the Moſquito ſhore, and the coaſt of Honduras. By the preſent treaty the Moſquito ſettlements were formally and explicitly relinquiſhed, as they had already virtually been by the 6th article of the general treaty of 1783. In return the boundaries of the Engliſh ſettlements on the coaſt and bay of Honduras were ſomewhat extended, but in ſuch manner, and on ſuch conditions, as to leave the king of Spain in full poſſeſſion of his territorial rights and excluſive dominion.

The impeachment of Mr. Haſtings was reſumed on the 7th of February, 1787, when Mr. Sheridan opened the third charge reſpecting the begum princeſſes of Oude, with an eloquence and energy which were perhaps never ſurpaſſed. On a diviſion, the numbers were, in favour of the motion 175, againſt it 68. On the 2d of March, Mr. Pelham opened the charge relative to the nabob of Ferruckabad, which was affirmed by 112 againſt 50 voices. On the 15th of March, the charge upon the ſubject of contracts was brought forward by ſir James Erſkine. "All of them," ſir James obſerved, "were made in direct violation of the regulations of the court of directors." On this article the diviſion was, ayes 60, noes 26. Upon the 23d of March, the charge relative to Fyzoola Khan was brought forward by Mr. Windham. This was carried on a diviſion of 96 againſt 37 voices. On the 2d of April, Mr. Sheridan opened to the houſe the charge upon the ſubject of corrupt and unreaſonable preſents. Upon a diviſion, the numbers appeared, ayes 165, noes 54. On the 19th of April, the charge reſpecting the waſte of the revenues was opened by Mr. Francis, who had formerly occupied with ſo much honour, the office of member of the ſupreme council in India, and who had recently taken his ſeat as a member of the houſe of commons. This charge was confirmed, notwithſtanding the unexpected diſſent of the miniſter, by 71 to 55 voices.

On the 9th of May, the report made by Mr. Burke from the committee, to whom it had been referred to prepare the articles of impeachment, was confirmed by the houſe, ayes 175, noes 89. On the following day it was voted that Mr. Haſtings be impeached; and Mr. Burke accordingly, in the name of the houſe of commons, and of all the commons in Great-Britain, repaired to the bar of the houſe of lords, and impeached Mr. Haſtings of high crimes and miſdemeanours. On the ſame day the articles actually prepared were ſent to the lords; and on the 21ſt Mr. Haſtings, being conducted to the bar of that houſe by the ſerjeant at arms, was taken into the cuſtody of the black rod, but on the motion of the lord chancellor was admitted to bail—himſelf in twenty thouſand pounds, and two ſureties, Mr. Sullivan and Mr. Sumner, in ten thouſand pounds each; and he was ordered to deliver in an anſwer to the articles of impeachment in one month from that time, or upon the ſecond day of the next ſeſſion of parliament. On the 30th of May, 1787, the king put an end to the ſeſſion by a ſpeech, applauding "the meaſures taken by parliament reſpecting the reduction of the national debt, and the treaty of navigation and commerce with the moſt Chriſtian king."

One of the acts of the ſeſſion of 1787, provided for the eſtabliſhment of a court of judicature in New South Wales, a part of the great iſland, we may ſay continent, of New Holland. The priſons in England, being inconveniently crowded, the idea of a diſtant removal, combined with the hope of colonial advantage, had occaſioned the reſolution of ſending convicts to the country bordering on Botany Bay, of which captain Cook had made favourable mention. About eight hundred delinquents, of which number three fourths were males, were ſent out under the care of captain Philip, who was commiſſioned to act as governor of the future colony. The duration of the voyage was above eleven months; and, when the fleet had reached the bay, the ſcarcity of freſh water rendered it expedient to ſeek another ſpot. Port Jackſon, being found more eligible, became the primary ſeat of the criminal exiles. The neceſſary rigour of the colonial government operated to the repreſſion of crimes, and the preſervation of general order; and in many of the convicts a ſenſe of ſhame had an extraordinary effect, which ſeemed to augur future proſperity and ſucceſs.

The parliament again aſſembled on the 27th of November; and in the early part of the ſeſſion Mr. Haſtings delivered in his anſwer to the impeachment of the commons, who immediately proceeded to the appointment of a committee of managers. The trial commenced on the 15th of February, 1788; Weſtminſter-hall being fitted up for the purpoſe with great magnificence. Mr. Burke was no leſs than four days in making his preliminary ſpeech, which was filled with vehement invective, with much rhetorical exaggeration, and with matter wholly extraneous to the ſubject. Men of plain ſenſe, whoſe object was truth, and who deſired only a clear and ſimple ſummary of facts, ſighed over theſe eccentricities, and augured ill of the procedure from ſo injudicious an outſet.

On the 22d of February, the Benares charge was opened by Mr. Fox; and it was concluded on the 25th by Mr. Grey. On the 15th of April, the charge relative to the begums of Oude was brought forward by Mr. Adam; and the evidence on this charge was ſummed up by Mr. Sheridan, in a ſpeech which laſted five days, and of which the more vigorous compreſſion only was wanting to the perfection of eloquence. The king put an end to the ſeſſion, July 11, 1788, by a ſpeech from the throne, in which

which he complimented the two houſes on their great attention and liberality.

Soon after the receſs of parliament, the king, who had been for ſome time indiſpoſed, was adviſed by his phyſicians to try the mineral waters of Cheltenham, which he was believed to drink in too profuſe a quantity. On his return to Windſor, late in the ſummer, his illneſs returned with new and alarming ſymptoms. By the end of October, it could no longer be concealed that the malady of the king was of a nature peculiarly afflictive and dreadful. A mental derangement had taken place, which rendered him totally incapable of public buſineſs.

The ſituation of affairs was at this period ſingularly critical. The prince of Wales, into whoſe hands the government of the country was then likely to fall, had conceived a deep reſentment againſt the miniſters; and he took no pains to conceal his decided predilection for the perſon and politics of Mr. Fox. This diſtinguiſhed ſtateſman, on the earlieſt intelligence of the king's indiſpoſition, had returned from a ſummer excurſion to the continent with incredible expedition; and in contemplation of an approaching change, a new arrangement of adminiſtration was already believed to be formed, conſiſting of the principal members of the former coalition miniſtry, lord North only excepted, and of which the duke of Portland was to be once more the oſtenſible head. The policy of oppoſition ſeemed evidently repugnant to every idea of unneceſſary delay. Yet doubts were ſtarted by Mr. Fox, Mr. Burke, and others of the ſame party, whether parliament could in this momentous caſe diſpenſe with that ſort of evidence on which they had been accuſtomed to proceed. The validity of the objection was very faintly conteſted, and a committee of twenty-one perſons in each houſe, after no long debate, appointed to examine and report the ſentiments of the king's phyſicians. The report of the committee was laid upon the table of the houſe of commons on the 10th of December; when Mr. Fox advanced, as a propoſition deducible from the principles of the conſtitution, and the analogy of the law of hereditary ſucceſſion, "that whenever the ſovereign was incapable of exerciſing the functions of his high office, the heir apparent, if of full age and capacity, had as indiſputable a claim to the exerciſe of the executive authority, in the name and on the behalf of the ſovereign, during his incapacity, as in the caſe of his natural demiſe."

On this aſſertion, Mr. Pitt roſe with much apparent warmth, and declared, "that the ſpeech of Mr. Fox was little ſhort of treaſon againſt the conſtitution. And he pledged himſelf to prove, that the heir apparent, in the inſtances in queſtion, had no more right to the exerciſe of the executive power than any other perſon; and that it belonged entirely to the two remaining branches of the legiſlature to make ſuch a proviſion for ſupplying the temporary deficiency as they might think proper." Thus was this famous queſtion at iſſue between theſe two great political rivals; in which it was remarkable, that Mr. Fox, the great advocate of the rights of the people, became the defender of prerogative; and Mr. Pitt, who had been loudly accuſed of deſerting the principles of liberty, appeared in the advantageous light of their zealous aſſertor. All the popular arguments and axioms of government, were upon this occaſion urged by Mr. Pitt. "When, (ſaid he,) the regular exerciſe of the powers of government was from any cauſe ſuſpended, to whom could the right of providing a remedy for the exiſting defect devolve, but to the people, *from whom all the powers of government originated? To aſſert an inherent right in the prince of Wales to aſſume the government, was virtually to revive thoſe exploded ideas of the divine and indefeaſible authority of princes, which had ſo juſtly ſunk into contempt, and almoſt into oblivion.* Kings and princes derive their power from the people; and to the people alone, through the organ of their repreſentatives, did it appertain to decide in caſes for which the conſtitution had made no ſpecific or poſitive proviſion." The diſcuſſion of the abſtract queſtion of right being perceived to afford a great and unexpected controverſy, the duke of York, ſoon after this debate, in the name of the prince, moſt nobly and ingenuouſly expreſſed his wiſhes, "that the queſtion might be waved. No claim of right, (his highneſs ſaid,) had been advanced by the prince of Wales; and he was confident that his brother too well underſtood the ſacred principles which ſeated the houſe of Brunſwick upon the throne, ever to aſſume or exerciſe any power, be his claim what it might, *that was not derived from the will of the people expreſſed by their repreſentatives.*"

Theſe debates were at length happily arreſted in their progreſs, by an intimation from the lord chancellor, that the king was declared by his phyſicians to be in a ſtate of convaleſcence. This was followed by a declaration on the 10th of March, 1789, that his majeſty being perfectly recovered from his indiſpoſition, had ordered a commiſſion to be iſſued for holding the parliament in the uſual manner. The tidings of the king's recovery diffuſed the moſt general and heartfelt ſatisfaction. A national thankſgiving was appointed, and the king himſelf went in ſolemn proceſſion to the cathedral of St. Paul's, to offer up his grateful devotions on this event; which was celebrated throughout the kingdom by ſplendid illuminations, and every other demonſtration of joy. In this ſeſſion Mr. Wilberforce brought forward his long-expected motion, relating to the abolition of the African ſlave-trade, which was now become the theme of public execration. See the whole of this intereſting ſubject amply diſcuſſed under the article SLAVE.

The trial of Mr. Haſtings was now reſumed; and the third article, reſpecting preſents illegally and corruptly received, was brought forward by Mr. Burke. In his opening ſpeech in ſupport of this charge, in which the fatal buſineſs of Nund-comar, who was ſaid to have fallen a victim to the rapacity of Mr. Haſtings, ſtood moſt conſpicuous, Mr. Burke made uſe of the following indiſcreet expreſſion: "that man Mr. Haſtings murdered by the hands of Sir Elijah Impey." This afforded a ground of petition from Mr. Haſtings, that this allegation ſhould be proſecuted in ſpecific articles, or that the houſe ſhould grant him ſuch redreſs as to them ſhould ſeem meet. After a long debate, the houſe of commons reſolved, "that no authority had been given by the houſe for the purpoſe of making any criminal charge reſpecting the death of Nund-comar, and that the words complained of ought not to have been ſpoken."

Mr. Grenville, ſpeaker of the houſe of commons, being advanced, upon the reſignation of lord Sydney, to the office of ſecretary of ſtate, was ſucceeded, after ſitting in the chair of the houſe ſcarcely ſix months, by Henry Addington, eſq. This new ſpeaker ſoon acquired great reputation, for dignity, integrity, and impartiality in the diſcharge of his office; and the ſeſſion was terminated Auguſt 11, 1789, by a ſpeech from the lord chancellor in the name of the ſovereign; in which it was obſerved, "that although the good offices of the king and his allies had not been effectual for the reſtoration of the general tranquillity, the ſituation of affairs promiſed to this country the uninterrupted enjoyment of the bleſſings of peace." This was an aſſurance highly and peculiarly grateful, in conſequence of the recent events which had taken place in the different kingdoms of Europe. A war had been kindled between Ruſſia, Auſtria, and the Turks, which gradually diffuſed itſelf from the Euxine to the Baltic—from the ſnow-clad mountains of Norway to the arid waſtes of Tartary: while the foundations of a great and ſtupendous revolution had been laid, which, almoſt inſtantly expanding itſelf into gigantic growth, became the ſubject of terror, no leſs than of aſtoniſhment to the ſurrounding nations. This was no other than the French revolution: for the riſe, progreſs, and fatal circumſtances of which, ſee the article FRANCE, in our ſeventh volume.

In this ſtate of things, the parliament of Great Britain was convened January the 21ſt, 1790. The king's ſpeech

contained nothing remarkable. It ſlightly glanced on the affairs of France, in declaring, "the internal ſituation of the different parts of Europe, to have been productive of events which had engaged his majeſty's moſt ſerious attention." But early indications appeared of the miſchiefs with which the recent tranſactions in that kingdom were likely to involve this country. The buſineſs relative to the abolition of the ſlave-trade was now reſumed; but it went on ſlowly and heavily. Every artifice of procraſtination was uſed on the part of the ſlave-merchants and planters, and the whole ſeſſion paſſed over in the hearing of evidence and examination of witneſſes.

The trial of Mr. Haſtings alſo proceeded with equal languor. On the 16th of February, 1790, the charge reſpecting corrupt preſents was recapitulated by Mr. Burke; but in the entire courſe of the ſeſſion the court ſat only thirteen days. The enthuſiaſm of thoſe who expected to have ſeen a great public delinquent brought to juſtice, was faſt changing to compaſſion for the man who ſeemed deſtined to live a life of impeachment, and to have become the object of a relentleſs perſecution. The evidence on three articles only of the general charge out of twenty-two was as yet cloſed, after which Mr. Haſtings was to enter upon his defence, and the commons were to reply; ſo that in all probability the judges and the witneſſes, the accuſers and the accuſed, would be all ſwept away by the hand of time before the trial could arrive at its legal termination. The common ſenſe of mankind revolted at this procedure. It appeared manifeſt to all, that this was not the mode in which human affairs could or ought to be conducted. The real merits of the cauſe were loſt in the immenſity of the detail. It was not to be expected or imagined that the public at large could pretend to form any judgment reſpecting it. This only without heſitation they inferred, that if Mr. Haſtings was ſo criminal as he was repreſented, a ſhort and ſimple ſtatement of facts would ſuffice to prove his guilt. But Weſtminſter-hall was converted into a lyceum, a ſchool of eloquence, and all was ſeen confuſed and magnified through the miſt of rhetorical declamation.

On the 31ſt of March, 1790, Mr. Dundas brought forward his annual ſtatement of the debts and revenues of the Eaſt-India company, as required by the regulation act. He repreſented their ſituation as in the higheſt degree proſperous and flouriſhing; and what is very remarkable, he did not conclude his eulogium of the preſent year with aſking a loan to enable them to avoid the horrors of inſolvency. Through the wiſe and equitable adminiſtration of lord Cornwallis, the revenues of Bengal had been advanced during the laſt year, without the aid of any new impoſition, from one million eight hundred thouſand pounds to two millions one hundred and fifty thouſand pounds. The preſent governor-general, on his acceſſion to his high office, had ſtated the ſituation of the provinces as moſt wretched and deplorable. In his diſpatch to the court of directors, Auguſt 2, 1789, he ſays, "Independent of all other conſiderations, it will be of the utmoſt importance for promoting the ſolid intereſt of the company, that the principal landholders and traders in the interior parts of the country ſhould be reſtored to ſuch circumſtances as to enable them to ſupport their families with decency, according to the cuſtoms of their ſeveral caſtes and religions. I am ſorry to be obliged to ſay, that agriculture and internal commerce have for many years been gradually declining; and the inhabitants of theſe provinces were advancing haſtily to a general ſtate of poverty and wretchedneſs. In this deſcription I muſt include almoſt every zemindar in the company's territories." And in his council-minute of September 18, 1789, his lordſhip writes, "I can ſafely aſſert, that one-third of the company's territory is now a jungle, inhabited by wild beaſts!" One of the primary and moſt important meaſures of the new governor-general was, to leaſe the lands in perpetuity at an equitable valuation to the actual occupants; in alluſion to which momentous tranſaction his lordſhip thus forcibly expreſſes himſelf to the directors: "The ſecurity of property, and the certainty with which each individual will now feel of being allowed to enjoy the fruits of his labours, muſt operate uniformly as incitements to labour and induſtry." This could not but be conſtrued as a bitter ſatire on the conduct of his predeceſſor; and as amounting to a very explicit acknowledgment of the miſery and oppreſſion which the inhabitants had long ſuffered under the former capricious government.

In April, 1790, Mr. Pitt preſented his ſtatement of the national revenue and expenditure of the ſtate; and it was very conſolatory to the public to be informed that the receipt of the exchequer had ſurpaſſed that of the year preceding in the ſum of half a million, and more ſo to be told that ſtill greater acceſſions might reaſonably be hoped from the uninterrupted enjoyment of the ineſtimable bleſſings of peace. It therefore excited peculiar aſtoniſhment, when in about a fortnight from this period, viz. May 5th, 1790, a royal meſſage was delivered by the miniſter, announcing a ſtate of things which bore the undiſguiſed and menacing aſpect of war. To elucidate this matter, it is neceſſary to mention that the celebrated circumnavigator Cook, in his laſt voyage of diſcovery, touching at divers ports on the weſtern coaſt of North America, purchaſed from the natives a number of valuable furs bearing a high price in the Chineſe market. This branch of commerce proving very lucrative, a ſpot of ground was, in 1788, procured from the Indians, and a regular eſtabliſhment, defended by a ſlight fortification, formed at a place called Nootka Sound, ſituated about the fiftieth degree of latitude. This being regarded by the Spaniards as an encroachment on their excluſive rights of ſovereignty, the Princeſſa, a Spaniſh man of war diſpatched for this purpoſe by the viceroy of Mexico, in the following ſpring, ſeized without ceremony upon the fort, and captured ſuch Engliſh veſſels, the Iphigenia, Argonaut, &c. as were found trading on the coaſt. At the ſame time the Spaniſh commandant hoiſting the national ſtandard, declared that the whole line of coaſt from Cape Horn to the ſixtieth degree of latitude belonged to the king of Spain. After ſome delay, and much loſs and vexation to the proprietors, the captured veſſels were reſtored by order of the viceroy, on the ſuppoſition, as he declared, "that nothing but ignorance of the rights of Spain could have induced the merchants in queſtion to attempt an eſtabliſhment on that coaſt." This was the exact counterpart of the memorable affair of Falkland Iſlands, which had ſo nearly involved Europe in a war twenty years before.

The claims of Spain, in relation to her rights of dominion and ſovereignty in America, were doubtleſs in the higheſt degree chimerical. By the treaty of 1763, the river Miſſiſſippi, flowing from north to ſouth in a direct courſe of fifteen hundred miles, was made the perpetual boundary of the two empires of Spain and Great Britain; and the whole country to the weſt of that vaſt river belonged to his catholic majeſty, by juſt as valid a tenure as the country eaſtward of the river to the king of England. Excluſive of this recent and deciſive line of demarcation, by which the relative and political rights of both nations were clearly aſcertained, the Spaniſh court referred to ancient treaties, by which the rights of the crown of Spain were acknowledged in their full extent by Great Britain. Charles III. king of Spain, died December, 1788, and his ſon, Charles IV. confiding in the juſtice of his claims, offered to ſubmit the deciſion of this queſtion to any one of the kings of Europe, leaving the choice wholly to his Britannic majeſty. The reply of the court of London to the Spaniſh ambaſſador, was full of dignity and ſpirit: "The act of violence mentioned in the memorial, neceſſarily ſuſpended any diſcuſſion till an adequate atonement had been made for a proceeding ſo injurious to Great Britain."

On the 10th of June, 1790, the king terminated the ſeſſion,

ſeſſion, and in his ſpeech ſignified the probability of a ſpeedy diſſolution of the preſent parliament; aſſuring the members in handſome terms of "the deep and grateful ſenſe which he entertained of that affectionate and unſhaken loyalty, that uniform and zealous regard for the true principles of the conſtitution, that unremitted attention to the public happineſs and proſperity, which had invariably directed all their proceedings;" and on the day following the parliament was diſſolved by proclamation.

Conſcious of her inability to contend alone with the power of England, Spain had in an early ſtage of the negociation applied to the court of France, to know how far ſhe could depend, in preſent circumſtances, upon the fulfilment of the conditions of the family compact, in caſe of a rupture with Great Britain. But ſuch was the tumultuous ſtate of affairs at Paris, that the court of Madrid plainly ſaw the inability of the French nation to engage in a war with England; and, yielding to neceſſity, complied firſt with the harſh demand of previous reſtitution and indemnification; and at length, on the 2d of October, 1790, a convention was ſigned at the Eſcurial, by which every point in diſpute was conceded by Spain. The ſettlement at Nootka was reſtored; the free navigation and right of fiſhery in the Southern Pacific Ocean, were confirmed to Britain; a full liberty of trade was granted to all the northweſt coaſts of America, beyond the moſt northerly of the Spaniſh ſettlements, unaccompanied, however, by any formal renunciation of their right of ſovereignty. And the two powers were, on the other hand, equally reſtrained from attempting any ſettlement nearer to Cape Horn than the moſt ſoutherly of the ſettlements actually formed by Spain. A very wiſe article was inſerted likewiſe in this treaty: that in all future caſes of complaint, or ſuppoſed infraction of the preſent convention, no act of violence ſhall be committed, but an exact report ſhall be made of the affair to the reſpective courts, who will terminate ſuch difference amicably.

The new parliament aſſembled on the 25th of November, 1790. In his opening ſpeech, the king ſignified "his ſatisfaction that the differences with Spain were brought to an amicable termination. He obſerved, that ſince the laſt ſeſſion of parliament a foundation had been laid for a pacification between Auſtria and the Porte; but that the war between Ruſſia and the Porte ſtill continued. "The principles on which I have hitherto acted (ſaid the monarch,) will make me always deſirous of employing the weight and influence of this country in contributing to the reſtoration of general tranquillity."

The terms of the convention with Spain were approved and ratified in both houſes by great majorities. To defray the expence of the armament which had taken place, Mr. Pitt, with the laudable reſolution to ſuffer no permanent increaſe of debt, propoſed various temporary taxes, which would diſcharge the incumbrance in four years, with the aſſiſtance of five hundred thouſand pounds, which he had it in contemplation to take from the unclaimed dividends lying in the Bank of England, the amount of which he eſtimated at 660,000l. This propoſition excited a juſt alarm in all the great chartered companies, and in the commercial and mercantile world in general; and was, therefore, ſtrongly and ably oppoſed. It was urged, "that agreeably to the terms of the original contract between the government and the public creditors, the directors of the bank are conſtituted truſtees for the public creditor. When the money is once paid into the bank, it ceaſes to be public money, and is inſtantly converted into private property; which muſt there remain a ſacred depoſit till it is claimed by the private individuals to whom it appertains. And even in caſe of the expiration of the charter of the bank of England, the directors ſtill remain a corporation by law, for the expreſs purpoſe of executing their delegated truſt. What miſchief may not reſult from the admiſſion of a power in government, arbitrarily to depart from the conditions of the contract actually made with the public? Under the the very term *unclaimed dividends*, is indeed veiled a groſs fallacy. Excluſive of the dividends of the laſt three years, which are not properly unclaimed but merely *unreceived* dividends, the balance amounts ſcarcely to a fifth part of the ſum which the miniſter propoſes to ſeize. If the recent and fluctuating balances of the bank are thus liable to ſeizure, the miniſter may one day order the money to be paid into the bank, and the next he may without any violation of public faith command it to be repaid into the exchequer." After much heſitation and conteſt, the miniſter conſented, by way of compromiſe, to accept of a loan of five hundred thouſand pounds from the bank, without intereſt, ſo long as a floating balance to that amount ſhould remain in the hands of the caſhier.

On the 17th of December, 1790, Mr. Burke moved, "that the houſe do reſolve itſelf into a committee, to take into conſideration the ſtate of the impeachment of Warren Haſtings, eſq." This being done, he made a ſecond motion, "that an impeachment by this houſe, in the name of the commons of Great Britain, againſt Warren Haſtings, eſq. for high crimes and miſdemeanours, is ſtill pending." From this propoſition, the entire corps of lawyers in the houſe with ſcarcely an exception declared their total diſſent: and Mr. Erſkine, in an elaborate ſpeech, endeavoured to ſhew that in conſequence of the diſſolution of parliament the impeachment had abated, and on this ground he was ſupported by Mr. Hardinge, Mr. Mitford, and ſir John Scott.

Upon this great queſtion, in the deciſion of which the honour, the dignity, and the authority, of the houſe, were ſo deeply involved, the ſpeaker with great propriety roſe to deliver his opinion: "If the maxim laid down by the lawyers were admitted as juſt, the conſequence was obvious. The impeachment of a profligate or corrupt miniſter might, by the inſidious intervention of the prerogative, at any time be rendered nugatory and abortive. In the view of the conſtitution, and even by the forms of parliament, the impeachment is preferred not by the houſe of commons merely, but by all the commons of England; and the houſe can be conſidered in relation to the proſecution as no more than the agents and attornies of the people at large. A ſecond houſe of commons therefore, though certainly poſſeſſing a diſcretionary power of dropping the proſecution, if upon due conſideration they are of opinion that it does not reſt upon a juſt foundation, are as certainly at full liberty to proceed in it, if in their judgment conducive to the ſafety or the intereſts of the ſtate. In an impeachment of the nature of the preſent, it would ſcarcely be imagined that twenty-two complex articles could by any mode of inveſtigation be decided upon in a ſingle ſeſſion. If then, agreeably to the genius of the ancient conſtitution, parliaments themſelves were to be made annual, the labour would be truly Syſiphean; as ſuch a trial never could arrive at a legal termination. Such were the plain dictates of common ſenſe; which pointed to rules of law, and precedents of parliament." Upon a general review of theſe facts and precedents, the ſpeaker gave it as his deliberate and decided judgment, that the impeachment was ſtill legally pending: in this opinion Mr. Pitt, Mr. Fox, and the moſt eminent parliamentary authorities on both ſides concurred. But very little progreſs was made in it during the ſhort remainder of the ſeſſion.

The ſtate of affairs in France, though paſſed over in total ſilence in the king's ſpeech, was now become very critical. In England, the anniverſary of the French revolution was celebrated, not without a certain mixture of indiſcretion, conſidering the lowering aſpect of the political horizon in France, and the party ſpirit which at this period raged throughout England. The latter months of the year paſſed over in gloomy ſilence. The parliament was not convened till the 31ſt of January, 1792. The king announced in his ſpeech the marriage of his ſon, the duke of York, with the princeſs Frederica, daughter of the king of Pruſſia. The general ſtate of affairs in

Europe, he ſaid, promiſed a continuance of peace, and he was induced to hope for an immediate reduction of the naval and military eſtabliſhments.

The attention of parliament towards the concluſion of the ſeſſion, was again forcibly drawn to the ſituation of India. From the era of the peace of Mangalore, concluded by the company with Tippoo Saib in 1784, the power of that prince had been regarded as very formidable. He was avowedly attached to the intereſts of France, to which country he had ſoon after that event ſent a ſplendid embaſſy, and eſtabliſhed an intimate friendſhip and alliance. The period, however, at length arrived, when, France being occupied with other and greater objects, a ſevere vengeance might be ſafely taken on the tyrant of Myſore, for all his perfidies and oppreſſions. The Dutch Eaſt-India company had in the ſeventeenth century conquered from the Portugueſe two forts, ſituated within the territory of Myſore, called Cranganore and Acottah. Theſe they had recently diſpoſed of by purchaſe to the rajah of Travancore, an ally of the Engliſh company. Tippoo, reſenting the conduct of the Dutch, and affirming that the rajah had no right to make any ſuch purchaſe within the limits of his territory, marched a conſiderable military force, in the ſummer of 1789, againſt Cranganore, with a profeſſed intent to reduce it to his dominion. The conduct of the rajah in making the purchaſe in queſtion, on ſo precarious a title, was ſeverely cenſured by the government of Madras; and, Mr. Holland, the preſident, warned him to deſiſt from his ambitious deſigns.

In conſequence of the powerful mediation thus interpoſed, Tippoo withdrew his troops, ſtill, however, aſſerting his claim to the feudal ſovereignty of the forts, and offering, as it is ſaid, to ſubmit his pretenſions to any impartial arbitration. But on the 1ſt of May, 1790, the rajah, relying, as it afterwards appeared, on the ſupport of the ſuperior preſidency of Bengal, made an offenſive attack on the army of Tippoo Sultan; and the war having thus commenced, the Engliſh government was bound in honour and juſtice to defend their ally. This the company were the better enabled to do, not merely from their knowledge of the ſtate of France, but from the treaties they had actually formed with the nizam of the Decan, and the Mahratta ſtates, for the expreſs purpoſe of humbling the power of Myſore. The grand Carnatic army immediately aſſembling, under the command of general Meadows, marched through the ſouthern or Coimbetore country, and penetrating the ghauts or paſſes of the mountains, advanced towards the city of Seringapatam, the capital of Myſore.

On the weſtern ſide, the Bombay army, under general Abercrombie, after reducing Cannanore, and ſeveral other places on the coaſt, entered the kingdom of Myſore; which, notwithſtanding the oppreſſion of the government, exhibited every where the marks of the higheſt cultivation and proſperity. The ſultan, defending himſelf with great reſolution, and no mean diſplay of military ſkill, general Meadows found himſelf under the neceſſity of retreating to the vicinity of Madras; where, in the month of December, 1790, lord Cornwallis aſſumed the command of the army in perſon. The plan of the war was now entirely changed, and a grand effort reſolved on, to force a paſſage to Seringapatam, through the country lying directly weſtward of Madras. On the 21ſt of March, 1791, the important town of Bangalore was taken by ſtorm, with little loſs on the part of the Britiſh, but with a dreadful carnage of the garriſon.

On the 13th of May, the army, by extraordinary exertions, arrived in ſight of the ſuperb capital of Myſore, defended by the ſultan in perſon; and, on the next day, an action took place, in which Tippoo was ſaid to be defeated, though he does not appear to have ſuſtained any very conſiderable loſs; and the ſwelling of the Cavery, (in an iſland formed by the branches of which Seringapatam is ſituated,) together with the want of proviſions, compelled lord Cornwallis to begin his retreat to Bangalore, almoſt before his victory could be announced. General Abercrombie, who had advanced through the ghauts on the oppoſite ſide, with a view to form a junction with lord Cornwallis, was now alſo obliged to lead back his army, fatigued, haraſſed, and diſappointed, over the mountains they had ſo lately and with ſuch difficulty paſſed. During theſe tranſactions, the troops of the nizam and the Mahrattas kept diſcreetly aloof, leaving the burden of the war almoſt entirely to the Britiſh.

But the next campaign, for which lord Cornwallis made unremitted preparations, opened under more favourable auſpices. Early in February, 1792, the eaſtern and weſtern armies, reſuming their former plan of operations, effected, before the end of the month, a junction under the walls of Seringapatam; the forces of the peiſhwa and of the nizam encamping alſo at a ſmall diſtance, and furniſhing to the Britiſh army a plentiful ſupply of ſtores and proviſions. On the 7th of February, a general attack was made by moonlight on the lines of the ſultan, which was attended with important effects; Tippoo being compelled to relinquiſh his former advantageous poſition, which covered his capital, and Seringapatam was, in conſequence of this defeat, cloſely and completely inveſted. The ſituation of Tippoo being now in the higheſt degree alarming and almoſt hopeleſs, he thought proper to ſend a vakeel to the camp of lord Cornwallis to ſue for peace; which the Britiſh general granted on the terms, 1. Of ceding one-half of his dominions to the allied powers. 2. Of paying three crores and thirty lacks of rupees, as an indemnification for the expences of the war. 3. The releaſe of all priſoners; and, 4. The delivery of two of his ſons as hoſtages for the due performance of the treaty.

On the 26th of February, the princes, each mounted on an elephant magnificently capariſoned, proceeded to the Britiſh camp, where they were received by lord Cornwallis with all poſſible kindneſs and affection. The eldeſt, Abdul-Kalic, was about ten; the younger, Mirzaud-Deen, about eight years of age. The princes were attired in white muſlin robes, with red turbans richly adorned with pearls, and they conducted themſelves with a politeneſs and propriety which aſtoniſhed the ſpectators. On the 19th of March, 1792, the definitive treaty, ſigned by the ſultan was delivered by the young princes, with great ſolemnity, into the hands of lord Cornwallis; but the ſums ſpecified in the ſecond article not being actually paid, the princes remained under the ſafeguard and cuſtody of his lordſhip until the payment was completed, when they were honourably reſtored. See the article HINDOOSTAN.

The ſeſſion cloſed with a ſpeech from the throne, June 15, 1792, in which his majeſty expreſſed to the two houſes "his great concern at the actual commencement of hoſtilities in different parts of Europe, in conſequence of the affairs of France; aſſuring them, nevertheleſs, that his principal care would be to preſerve to his people the uninterrupted bleſſings of peace." At this criſis a very remarkable letter was written in confidence by the king of France to the king of England, expreſſing in the moſt flattering terms his obligations to his Britannic majeſty for his impartial conduct, and making the moſt eager advances to the formation of a treaty of amity and alliance. "Between our two countries, (ſays the French monarch,) new connections ought to take place. I think I ſee the remains of that rivalſhip which has done ſo much miſchief to both, daily wearing away. It becomes two kings, who have diſtinguiſhed their reigns by a conſtant deſire to promote the happineſs of their people, to connect themſelves by ſuch ties as will appear to be durable in proportion as the two nations ſhall have clearer views of their own intereſts. I conſider the ſucceſs of the alliance, in which I wiſh you to concur with as much zeal as I do, as of the higheſt importance. I conſider it as neceſſary to the ſtability of the reſpective conſtitutions, and the internal tranquillity of our two kingdoms; and

I will

I will add, that our union ought to command peace to Europe."

It was in a ſhort time after this announced, that the combined armies of Auſtria and Pruſſia had entered France, under the command of the duke of Brunſwick, who had on the 25th of July iſſued a proclamation which ſeemed purpoſely calculated to complete the ruin of the French king. In this famous manifeſto the moſt dreadful vengeance is denounced againſt the French nation: all ſuch as are found in arms againſt the troops of the allied powers, are threatened to be puniſhed as deſtroyers of the public tranquillity; and the city of Paris is threatened to be delivered up to the horrors of military execution! This violent declaration filled up the meaſure of the popular fury, and the fate of the unfortunate French monarch was hence decided. See the article FRANCE.

M. Dumourier, to whom the army of France was now entruſted, could ſcarcely oppoſe thirty thouſand men to the army of the duke of Brunſwick, conſiſting of eighty thouſand. With this ſmall force he determined to make his ſtand at the foreſt of Argonne, the paſſes of which after repeated attempts the duke found himſelf unable to force. The French army receiving continual reinforcements, and the Pruſſians ſuffering under the united evils of ſickneſs and famine, the duke of Brunſwick was compelled to the humiliating neceſſity of commencing a haſty retreat, and the French arms were triumphant in every quarter. Early in November, Dumourier entered the Auſtrian Netherlands; and on the 5th of that month, attacking the Auſtrian entrenchments at Jemappe, near Mons, he gained a moſt complete and ſignal victory, the conſequences of which were deciſive as to the fate of the Netherlands.

In conſequence of the virtual depoſition of the French monarch, lord Gower, the Engliſh ambaſſador at Paris, received orders from the court of London to quit the kingdom; for that, the functions of royalty being ſuſpended, his miſſion was at an end. Nevertheleſs, M. Chauvelin, the French ambaſſador, ſtill remained in London, though from this period unacknowledged in any public or authoriſed capacity. And as a ſtriking indication of the deſign of Great Britain to take a part in the war, the miniſter, on the ſucceſs of the French arms in Flanders, made an unſolicited offer of aſſiſtance to the ſtates-general in caſe of need. But their high mightineſſes declined to accept the favour, declaring themſelves under no apprehenſion of an attack.

On the 17th of December, 1792, a memorial was preſented by M. Chauvelin to lord Grenville, in which he informed his lordſhip, that the executive council of the French Republic, had authorized him to demand, Whether France ought to conſider England as a neutral or hoſtile power; at the ſame time being ſolicitous, that not the ſmalleſt doubt ſhould exiſt reſpecting the diſpoſition of France towards England, and of its deſire to remain in peace. To which lord Grenville returned the following anſwer: "If France is really deſirous of maintaining friendſhip and peace with England, ſhe muſt ſhew herſelf diſpoſed to renounce her views of aggreſſion and aggrandizement, and to confine herſelf within her own territory, without inſulting other governments, without diſturbing their tranquillity, without violating their rights." At length this buſineſs was brought to a criſis, by a letter from lord Grenville to M. Chauvelin, dated January 24, 1793, in which his lordſhip ſays, "I am charged to notify to you, ſir, that the character with which you had been inveſted at this court, and the functions of which have been ſo long ſuſpended, being now entirely terminated by the fatal death of his moſt Chriſtian majeſty, you have no longer any public character here; and his majeſty has thought fit to order that you ſhould retire from this kingdom within the term of eight days."

The death of the French monarch was indeed a diſaſtrous and mournful event. It is well known that the executive council, and a great majority of the conventional aſſembly, were eagerly deſirous to have averted this calamity; but the violence of the jacobin faction, and the ſavage rage of the populace, hurried on the fatal cataſtrophe. The convention, however, ſtung at the diſmiſſal of their ambaſſador from the court of London, came to an ultimate reſolution; and on the 1ſt of February, 1793, a decree unanimouſly paſſed that aſſembly, declaring the republic of France at war with the king of Great Britain, and the ſtadtholder of Holland.

The operations of the French republican army commenced againſt the Dutch, with an attack upon Breda, which was defended by count Byland, who was ſoon terrified into a capitulation; but, at Williamſtadt, the aid of the Britiſh troops was uſefully exerted in compelling the French to retire. Yet Gertruydenberg, where the Engliſh was not preſent, was quickly taken; and Dumourier was preparing to ruſh into the heart of Holland, when he was called off to a different ſervice. The French troops in the Netherlands, and on the German frontier, being injudiciouſly poſted, and the commanders not being on the moſt harmonious terms, the prince of Saxe-Cobourg, who commanded the Auſtrians, conceived the hope of bringing the republican army to a diſadvantageous action. Clairfait was therefore detached over the Roer; and, when this intrepid officer had aſſaulted ſome poſts with advantage, the prince, engaging the enemy near Aix-la-Chapelle, on the 3d of March, 1793, obtained a conſiderable victory, deſtroying about five thouſand of the French. The vanquiſhed fled toward Liege in great confuſion; and the conſternation of the defeat extended to the camp of general Miranda, who was employed in beſieging Maeſtricht. He raiſed the ſiege on the approach of the victorious army: the Lower Maes was left open to the allies; and the divided bodies of the French took refuge in Brabant, where they were greatly weakened by deſertion.

Dumourier now aſſumed the command of the retiring troops, and led them back againſt prince Cobourg's army. In ſome ſkirmiſhes he met with ſucceſs: but, in an obſtinate conflict near Landen, March 18, he was obliged to yield the honour of the day, after loſing above three thouſand of his men; and, being unſucceſsful in another engagement, he retreated to the borders of France. His ambition and talents had excited the jealouſy of the jacobin faction, who, being alſo diſguſted at his repugnance to their ſanguinary ſchemes, ſought an opportunity of cruſhing him. He was endeavouring to reſtore diſcipline to a diſorganiſed army, when commiſſioners, ſent from Paris to arreſt him, arrived in his camp. Inſtead of ſuffering them to ſeize him, he ordered them to be delivered up to the Auſtrians, as hoſtages for the ſafety of the royal family of France, and endeavoured to prevail on his army to aim at a counter-revolution: but he found that his exhortations had no effect on their republican ſpirit; and he was even apprehenſive that they would betray him into the hands of his enemies. Thus ſituated, he fled to Mons, and offered to the allies that ſervice of which he deemed his countrymen unworthy: but, being expoſed to neglect and diſgrace, he ſoon quitted the army for a private ſtation.

The ſucceſſor of the fugitive general was Dampierre, who being attacked near Valenciennes, on May 8, repelled the aſſailants. In a battle near St. Amand, the Britiſh troops, particularly the guards, under the command of the duke of York, obtained great praiſe by their ſpirited exertions. They ſo effectually ſupported the Auſtrians and Pruſſians, that the French were at laſt conſtrained to retire. The republican commander received a ſhot which proved fatal; and loſt about four thouſand of his men in killed and wounded. The valour of the Engliſh alſo appeared when the French were attacked in the well-fortified camp of Famars, May 23, which covered the city of Valenciennes, and from which they were driven, after the fall of a conſiderable number of men on both ſides. The allied army now ſubjected Valenciennes to a cloſe ſiege,

in which much time was consumed and many lives were lost. Condé was at the same time blockaded; and it was hoped that the reduction of these important towns would be followed by triumphant success. After a blockade of three months, the governor of Condé surrendered, on the 10th of July, to the prince of Wirtemberg. The siege of Valenciennes was supported with vigour by the duke of York, but the most arduous part of the siege devolved to the Austrians, of whom about thirteen hundred were killed. When a general assault was commenced, July 28, the garrison hastily capitulated, and obtained leave to retire into France, on condition of not serving against the allies during the remainder of the war.

Thus far the progress of the allied army in the interior of France carried all before it; but its subsequent movements, and final separation, have remained an inexplicable mystery on the minds of the people in England, which no system of political measures have yet been able to unravel. Perhaps the following remark of M. Lacretelle, in his *Précis Historique de la Révolution Française*, published at Paris in 1803, may help to explain this obscure part of the campaign: "After the fall of Valenciennes, not one of the powers seemed to recollect the purposes of their league. France now appeared to them another Poland; and partition views and selfishness led astray their policy. The emperor declared Valenciennes to be his conquest. The prince of Cobourg threatened an invasion far better concerted than that of the king of Prussia. He had already obliged the French to quit Cæsar's camp; and Cambray would have yielded but feeble resistance, and the line of strong posts would have been passed. The numerous German cavalry was about to over-run the plains of France. Paris would have known its approach by that of famine: but Austria forgot Paris and France, and fixed its thoughts on Quesnoy and Maubeuge, as did England upon Dunkirk. An absurd order was issued by the cabinet of St. James's; and the English army, commanded by the duke of York, separated itself from the conquerors of Famars. Had the most inveterate hatred directed this movement, it could not have rendered it more incompatible with any plan of future concert and mutual support. The prince of Cobourg marching towards Maubeuge, and the duke of York towards Dunkirk, caused a separation of their forces, exactly such as active and provident enemies could have wished."

The duke of York had no sooner made known his intention of attacking Dunkirk, than the hereditary prince of Orange assaulted several posts, chiefly with a view of covering his highness's march. He forced Lincelles, August 18, with small loss; but he was soon dispossessed of it by a superior force. Three British battalions, conducted to his aid by major-general Lake, bravely stormed a very strong redoubt, and saved the Dutch by routing the enemy. Near Furnes, another brisk engagement occurred, in which the allies were also successful. But the unaccountable delay of naval preparations for the siege, and the necessity of waiting for very heavy artillery, gave the French time to make ample provision for the defence of the town. The Hanoverian general Freytag was fiercely attacked on September 6, by the French army, and obliged to retreat with considerable loss. He and prince Adolphus, the youngest son of our sovereign, were made prisoners in their retreat, but were seasonably rescued by a detachment sent to their relief. The duke's right wing was harassed by a sally; but, on this and some other occasions, he drove back the enemy into the town. An improbability of success, however, constrained him to raise the siege; and his artillery, with a great store of ammunition, fell into the hands of the enemy. Houchard, for suffering the besieging army to escape, was put to death by the tyranny of the convention.

Soon after the duke of York had raised the siege of Dunkirk, the Dutch posts upon the Lys were forced, the consequence of which was the evacuation of Menin. This misfortune was counterbalanced by the surrender of Le Quesnoy to the emperor's troops, and by the defeat of a numerous body of French near Bisseghem. General Beaulieu then assaulted Menin, and re-took it with very small loss. The prince of Saxe-Cobourg invested the camp and fortress of Maubeuge; but, after two engagements, in one of which he was severely harassed, he quitted his advantageous position. Other conflicts in the Netherlands displayed the obstinate courage of the opposite parties, without any decisive result. In Germany the allies for a time were more fortunate than the French. They defeated the enemy on several occasions, and, among other successes, recovered the city of Mentz, to the great joy of the imperial diet, which had recently declared its concurrence in the war. They afterwards attacked the lines of Weissembourg, and forced them by a persevering defiance of all danger.

The Spaniards, having invaded France, prevailed in different conflicts, and reduced Bellegarde and Colioure. This ill success of the republican army in the south, was embittered by the dread of an extension of that spirit of loyalty which had appeared at Marseilles, Toulon, and Lyons. The Marseillois, indeed, did not long continue refractory; but, at Toulon, the mal-contents were so hostile to the convention, that they surrendered that important city and arsenal to lord Hood, commander of the British fleet in the Mediterranean, August 29, on his promise of assistance in the recovery of the constitution of 1789, with a proviso for the full restitution (after the return of peace) of the town, forts, and vessels, to Louis XVII. or his lawful successor.

In La Vendée (a part of the former province of Poictou), and other western departments, numerous bodies had taken arms, under the celebrated Charette, for the restoration of royalty; and some desperate engagements had occurred, to the disadvantage of the republican government. But, when the latter had repeatedly routed the insurgents, Barrère announced to the legislature the extinction of the revolt. This orator, however, paid little regard to truth in his statements; for the insurrection still bore a serious and violent aspect. But at Lyons, the republican arms triumphed over all opposition. General Doppet, after a vigorous siege, entered the city, from which the leaders of the revolt had previously retired. A great part of the town was wantonly destroyed; and many thousands of the inhabitants, of both sexes, were put to death in different modes, under the direction of Collot d'Herbois, without even the formality of a trial.

Toulon was invested by a numerous army of French republicans, towards the close of 1793, under general Dugommier; but it was defended with great spirit and bravery by the English. Brisk sallies were made by the garrison, which consisted of soldiers of various nations. In one of the sorties, general O'Hara was wounded and taken prisoner; and in this and other conflicts, no small loss was sustained by the allies. They were obliged to extend their force so as to occupy eight considerable posts, and several dependent stations; and, while about nine thousand men filled those posts, scarcely more than three thousand remained in the town. The increasing strength and resentful spirit of the besiegers alarmed the confederates, who, being dislodged from some of their chief stations, resolved to quit a place which they found it impossible to retain; therefore, destroying the arsenal, and desolating the city, they evacuated the garrison on December 18, 1793. Sir Sydney Smith undertook the dangerous task of burning the store-houses and ships, amidst a continued firing from the enemy on shore. A "rapid ignition," took place; but the operators were unable to extend it to the vessels which were nearest to the town. Nine ships from seventy-four to eighty guns, besides some that were not completely prepared for service, were destroyed, with an immense quantity of naval stores. Three ships of the line, four frigates, and many sloops, were added to the British fleet; and as many of the royalists as could be stowed in the retiring vessels, were

brought off by the allies. It is said that Dugommier expressed, in council, the utter impossibility of recovering this great naval arsenal, unless a most competent engineer could be found, to manage and direct the immense artillery to be employed against it. Such a person was at length discovered in Napoleone Bonaparte, an obscure Corsican, who had been educated at the military academy in France, and served as a lieutenant in the regiment of La Fere. Having fled from the troubles that prevailed in his native island, he now offered his services, and was employed by the deputy Barras, on the recommendation of his countryman Salicetti, and certainly contributed by his military talents to decide the fate of Toulon.

On the Rhine the French arms were equally prosperous; for, though the duke of Brunswick had the advantage in several actions, and general Wurmser was sometimes successful, the overwhelming mass of republicans so effectually prevailed after four days of continued conflict, that the lines of Weissembourg were recovered, and Landau was relieved from a blockade by the flight of the Prussians and Austrians. The cities of Spire and Worms were seized; and stores of various descriptions, to a great amount, fell into the hands of the republican army.

The fleets of the contending nations had no engagement in this first year of the war; but some maritime expeditions were undertaken. An armament sailed to Tobago, and the island was soon reduced; but, when a squadron had appeared before Martinique with a similar view, the debarkation of a small force proved fruitless; and the English retired. In the northern part of the western hemisphere, two islands (St. Pierre and Miquelon) were added to the British possessions. In India, the ships and factories of the French were taken as soon as the intelligence of the war arrived; and Pondicherry was surrendered by a spiritless garrison to the British arms. In the Mediterranean, our naval commanders endeavoured to intimidate the grand duke of Tuscany and the republic of Genoa into a conjunction with the allied powers; but French influence, and a desire of peace, had a greater effect than these menaces. While the war thus raged, a declaration was presented to the world, on the part of Great Britain, dated October 29, vindicating the exercise of external force for the establishment of order in France, as such interference was essential to the security and repose of all civilised powers; recommending an hereditary monarchy, yet not insisting on the exclusion of any other form of government which might prove compatible with the peace and safety of Europe.

In opening a new session of parliament, January 21, 1794, the king observed, that he and his subjects were engaged in a momentous contest, on the issue of which depended the maintenance of the national constitution, laws, and religion, and the security of all civil society. Having mentioned the advantages obtained by the arms of the confederate powers, he added, that the circumstances by which their further progress had been impeded, not only proved the necessity of vigour and perseverance, but confirmed the expectation of ultimate success. He regretted the necessity of continuing the war; but he thought he should ill consult the essential interests of his people, if he desired peace on any grounds exclusive of a due provision for their permanent safety, and for the independence and security of Europe.

The disembarkation of a body of Hessians in the isle of Wight, and their detention there, without the previous consent of parliament, furnished a topic of debate. Mr. Grey moved, that the commons should declare it to be contrary to law; and the earl of Albemarle contended for the propriety of enacting a bill of indemnity on account of this invasion of the constitution. A treaty was also announced to the parliament, by which the king had bound himself, in concert with the Dutch, to the payment of 50,000l. per month for a Prussian army of 62,400 men, of 300,000l. for putting that force in a state of action, and of a large sum for bread and forage. It was observed, that the king of Prussia was more interested in opposing the French than we could be; that he had been one of the chief instigators of the war; that former engagements required him to continue hostilities without being subsidised by Great Britain; that the terms were extravagant; and that the men who thus lavished the treasures of their country had no reason to expect good faith from a venal and fickle prince, who would probably desert us in the hour of need. It was said in reply, that it was illiberal to doubt the honour of that magnanimous court; but the event afforded a new and singular instance of rapacity and defection in a foreign ally.

The conduct of the war was the subject of strong censure in various debates; and the improbability of its final success was repeatedly noticed. Mr. Jenkinson exposed himself to ridicule in one of these discussions, by asserting the practicability of marching to Paris, and overturning the obnoxious government. After a review of the French revolution and the progress of the war, the duke of Bedford proposed, as preliminaries to a peace, a candid and explicit declaration of the object of the war, and a renunciation of all concern with the internal affairs of France; and Mr. Fox ably harangued the commons on the same ground; but both houses exploded all propositions of this nature.

It was supposed that the trial of Mr. Hastings would have been brought to a close in the preceding year; but the further examination of witnesses, and the intervention of speeches from the advocates and the managers, retarded the conclusion. In this session, marquis Cornwallis appeared as a witness; and his testimony being favourable to his predecessor, gave a remarkable turn to the cause. Replies to the defensive allegations followed these proceedings; and Mr. Burke, in a series of admired harangues, again entered into the history of India, and delineated in glowing but overcharged colours, the chief features of the impeachment. He then urged with forcible eloquence the claims of eternal justice, and thus closed the process of accusation, June 16, 1794. The managers were complimented by Mr. Pitt with a motion for a vote of thanks, which passed, though not unanimously.

On the day of prorogation, July 11, earl Fitzwilliam was appointed president of the council; the duke of Portland became one of the secretaries of state; earl Spencer was declared keeper of the privy seal, and Mr. Windham secretary at war.

In the mean time the campaign of 1794 opened; but with the disadvantages most commonly attendant upon allied powers. The rivalry between Austria and Prussia, and the jealousy which each had conceived of the other, were so visible to the duke of Brunswick, that he resolved to have no further concern in the command of an army whose efforts, he thought, would be rendered unavailing by the disunion of ostensible confederates. His resignation was soon followed by a complaint from the Prussian monarch of the great expence of the war, and a proposal that the states of the empire should provide for the subsistence of his troops; a request to which that body did not accede. When the emperor desired that the diet would order the people in the frontier circles to rise in a mass, the court of Berlin strongly opposed the measure as fruitless and dangerous. The general levy did not take place; and the contingents of the German princes were imperfectly and tardily furnished.

Extraordinary preparations were made for the defence of the Netherlands, and the attack of the French frontiers. The emperor Francis, took the personal command of the Austrian, British, and Dutch armies, April 17, and led them forward in eight columns. The three first of these battalions dislodged the enemy from various posts; and the fourth, conducted by the duke of York, approaching Vaux amidst a very severe fire, forced that post as well as the wood of Bohain. The works at Premont were stormed by the corps which sir William Erskine commanded; while the three other columns gained their appointed

pointed ſtations without the hazard of a conflict. Encouraged by this ſucceſs, the emperor reſolved to inveſt Landrecy; and the hereditary prince of Orange was intruſted with the direction of the ſiege. This gallant prince aſſaulted an entrenched camp with vigour and ſucceſs; and, during the ſiege, lieutenant-general Otto, with Britiſh and Auſtrian troops, totally routed a conſiderable body of the French near Cambray. The two covering armies were afterwards attacked, April 26, with great impetuoſity. The villages in the duke of York's front were quickly taken; but Otto, with the right wing, charged the enemy in the flank and rear, and did great execution. The left wing alſo triumphed; and the Auſtrian army met with equal ſucceſs. General Clairfait, however, was defeated at Mouſcron; but the ſurrender of Landrecy compenſated that diſaſter. Near Tournay a gallant action took place, to the diſadvantage of the French; and, though they obtained a victory over Clairfait near Courtray, they were routed by general Kaunitz near Mons. But in another battle near Tournay, May 17, they ſo effectually profited by their ſuperiority of numbers, that the allies were defeated with great loſs, and the duke of York eſcaped with extreme difficulty. In a ſubſequent conflict, victory was long doubtful; but it ultimately devolved to the confederates, who killed or wounded above ten thouſand of the French republican army.

The moſt memorable engagement of this campaign in the Netherlands, was that of Fleurus. The importance of the beſieged town of Charleroi induced the prince of Saxe-Cobourg, June 26, to riſk a battle for its relief, as he did not know that the garriſon had already ſurrendered. He attacked the army of Jourdan near Goſſelies, and met with ſuch ſucceſs as flattered him with the hope of triumph. Thrice were the French driven back to their entrenchments with great ſlaughter; but Jourdan, (who had recently obtained conſiderable advantages near Arlon and Traſegnies,) again renewed the conteſt with alacrity and vigour; and, being well ſupported with freſh ſupplies of men, he overpowered his adverſaries after a conflict of fifteen hours. About ten thouſand of the allies were killed or wounded; and the reſt fled with precipitation.

The Engliſh army had no ſhare in this diſaſtrous colliſion, or in thoſe actions which, for four ſucceſſive days, thinned the ranks of Clairfait and Moreau, near Ypres. The retreat of the Auſtrians, and the reduction of that town by the French, conſtrained the duke of York to remove from Tournay, which, with Oudenarde and Ghent, quickly admitted the French yoke. Oſtend was evacuated by the Britiſh garriſon, and Mons by the Auſtrians under prince Cobourg; who, being again defeated by Jourdan, left Bruſſels to the victorious enemy. The duke of York, now reinforced by the earl of Moira with a ſmall army from England, made a ſhow of defence at Mechlin; but he was ſoon obliged to retire toward the Dutch frontiers. The defeat of Clairfait near Louvain put the French in poſſeſſion of that city. Nieuport was reduced by a vigorous ſiege: Namur and Antwerp were taken with leſs difficulty: the conqueſt of the biſhopric of Liege followed this ſignal ſucceſs in the Low Countries; and the United Provinces were now threatened with the terror of becoming the theatre of the war.

Mean time the feuds and animoſities of the newly-conſtituted powers at Paris ran high. The jealous and tyrannical Robeſpierre, anxious for the maintenance of his own authority, watched the conduct of all parties, haraſſed all who murmured, and wreaked his vengeance on all who oppoſed him. Suſpecting Hebert, and other chiefs of the Cordelier club, of aiming at political pre-eminence, he accuſed them of being traitors to the republic, and ſubjected them to the new-fangled inſtrument of decapitation, the guillotine. He coolly ordered the arreſt of many of his former aſſociates, and ſacrificed them without remorſe to his fears and his ambition. Executions were wantonly multiplied; and even the ſiſter of Louis XVI. one of the moſt reſpectable and virtuous women of her age, was deprived of life by the atrocious cruelty of the deſpot. The ſervile ſubmiſſion of the legiſlative body to the tyranny of this monſter, and the paſſive ſubſerviency of an oppreſſed community, aſtoniſhed and diſguſted foreign nations: but the diſgraceful yoke was at length ſhaken off.

Such continued inhumanities excited a general horror, and, by rendering life precarious and inſecure, alarmed all ranks throughout the republic, except the loweſt of the populace. Some ſpirited members of the convention, among whom were Tallien, Barras, and Freron, reſolved to ſubdue the tyrant, or die in the attempt. They rouſed the aſſembly againſt him by a detail of his enormities, and procured a decree for his arreſt. Henriot, the commandant of the Pariſian guard, prepared to cruſh the party that oppoſed his patron; but a vote of outlawry confounded even the armed force, and the exertions of the friends of the convention ſecured the public tranquillity. In a fit of deſpair, he who had deſtroyed ſo many of his fellow-creatures attempted to diſpatch himſelf; but he failed in his efforts, and was beheaded with his principal adherents, July 28, 1794, amidſt the exultations of the ſpectators.—See the article FRANCE.

The outrageous inhumanity of Robeſpierre had extorted a decree from the convention, for the murder of all the Britiſh and Hanoverian ſoldiers who ſhould fall into the hands of the French: but the troops were not ſo baſe as to comply with this order. After the conqueſt of all the Auſtrian low countries, except Luxembourg, the French eaſily recovered Le Queſnoy, and the three other towns which had been taken by the confederated army; and they found in thoſe place very conſiderable ſupplies.

The Pruſſians did not act with much vigour in this campaign; nor were they wholly inactive. They forced the entrenchments at Kaiſerſlautern, but they and the Auſtrians were defeated at Tripſtadt, and other poſts. The city of Treves was now taken by the republicans; and, after they had repeatedly triumphed over the generals Latour and Clairfait, they reduced the greater part of the country between the Maes and the Rhine. Againſt their Spaniſh foes the French were alſo eminently ſucceſsful. They routed a far ſuperior number near St. Jean de Luz; and, after another victory, took Fontarabia and St. Sebaſtian. They met with ſucceſs in a ſkirmiſh at Alberdes, obtained a more important advantage at Colioure, and defeated an army which oppoſed them at Bellegarde. They routed the enemy near Mouga, where Dugommier, their victorious general, was ſlain; and, having ſtormed the formidable works near Figueres, they took poſſeſſion of various towns, and filled the whole country with conſternation. Good fortune alſo attended the French arms in Italy. They reduced Oneglia, forced the Col de Tende, and ſubdued ſeveral diſtricts in the ſouthern parts of Piedmont. The defenſive ſtrength of Mont Cenis ſerved only to inflame their ardour: they ſtormed the well-fortified poſts of that difficult paſs; and, having defeated their opponents in other parts of the country, they looked forward to more important victories.

The Engliſh in the Mediterranean were now employed in the reduction of Corſica. An armament under lord Hood attacked the town and forts of Baſtia, after the acquiſition of San Fiorenzo: the ſeamen and ſoldiers co-operated with emulous zeal; and the place was taken with ſmall loſs. General Paoli having exerted his influence over his countrymen, they voted, in a regular aſſembly, June 14, 1794, that the ſovereignty of the iſland ſhould be transferred to the king of Great Britain. Sir Gilbert Elliot, in the royal name, accepted the offer, with an engagement for the maintainance of that conſtitution which was then framed by the national repreſentatives. The ſtrong town of Calvi was ſtill poſſeſſed by the French: but it was at length reduced by Britiſh valour. But the ſucceſs of the Engliſh fleet in the Atlantic, excited ſtronger emotions of joy than the addition of Corſica to the dependencies of Great Britain. Earl Howe was cruiſing off the coaſt of Bretagne, when he was informed that the

the French admiral, Villaret-Joyeuſe, had ſailed from the harbour of Breſt. Having approached the enemy to the weſtward of Uſhant, rear-admiral Paſley attacked the rear with ſpirit; and a briſk engagement enſued on the following day, when the nautical ſkill of the veteran Howe enabled him to obtain the weather-gage. Three days afterwards, June 1, he brought the French to a cloſe action, having twenty-five ſail of the line oppoſed to twenty-ſix. In the Queen Charlotte he broke their line, and evinced an admirable union of ſkill and intrepidity. Captain Berkeley, in the Marlborough, had a dangerous conflict with two ſhips; but he diſabled one, and repelled the other. The Brunſwick, commanded by Hervey, engaged ſeveral ſhips with great gallantry, and had a long conteſt with Le Vengeur, whoſe crew implored mercy; but the Britiſh captain could not prevent her from ſinking. Though many of the French were ſaved on this occaſion by the humanity of their adverſaries, above three hundred went to the bottom. The ſame fate attended the fine ſhip Le Jacobin, out of whoſe crew ſcarcely a man was ſaved; but the undaunted republicans, when ſinking on the wreck of their ſhip, exultingly cried out with their laſt breath, *Vive la liberté! Vive la république!* The French line was broken in three places; and at length the Britiſh fleet obtained a memorable triumph. When the firing ceaſed, the admiral found that ſix ſhips of the line had been taken, in which 690 men were killed, and 580 wounded; a number far exceeding the official liſt of ſufferers (904) in the whole Britiſh fleet.

An expedition to the Weſt Indies alſo proved, in a great degree, ſucceſsful. Sir Charles Grey landed, with a reſpectable but not numerous force, on the iſland of Martinique, while ſir John Jervis ſuperintended the naval operations. Several ſtrong poſts were ſeized; and the reduction of Pigeon-iſle opened the bay and harbour of Fort Royal to the ſhipping. Of the works near St. Pierre the invaders gained poſſeſſion with ſmall loſs; and that town was then evacuated by the enemy. To complete the inveſtment of Fort Bourbon, it was neceſſary that the heights of Sourier ſhould be gained. Bellegarde, a bold leader of the mulattoes and negroes, might have defended this poſt for a conſiderable time, if he had not been prompted by the impetuoſity of his ſpirit to ruſh from the heights with a part of his force, and attack the left diviſion of the Britiſh army. Pleaſed at the opportunity, the general ſent three battalions from his right to ſtorm the weakened camp, which was eaſily forced by the valour of this detachment, while Bellegarde was ſoon repelled by the firmneſs of the corps which he engaged.

Preparations were now made for aſſaulting Fort Royal; and a detachment of grenadiers and light infantry, under the conduct of colonel Symes, marched to the back of it, while commodore Thompſon, directed the exertions of a ſelect naval force. Captain Faulknor particularly diſtinguiſhed himſelf on this occaſion. He puſhed forward at the head of the crew of the ſloop which he commanded, and ſcaled the walls in defiance of repeated volleys of grape-ſhot. This daring act concurred with the approach of the ſoldiery, to intimidate the garriſon into a ſurrender, which took place on the 20th of March, 1794. The commandant of Fort Bourbon, no longer inclined to reſiſt, propoſed a capitulation; and the acquiſition of this fortreſs completed the reduction of the iſland. Major-general Dundas and prince Edward, who diſtinguiſhed himſelf in theſe exploits, afterwards landed in St. Lucia, and proceeded to the inveſtment of la Morne Fortunée. Lieutenant-colonel Coote ſtormed a redoubt and two batteries; and the dread of an aſſault of the fort produced its ſpeedy ſurrender. The iſles called the Saints were then reduced; and a diſembarkation was effected at Goſier-bay, in Guadaloupe. Fort Fleur d'Epée was quickly ſtormed; and the impetuous fire of the aſſailants had ſpared only a ſmall part of the garriſon. Fort Louis, and other poſts of Grande Terre, were abandoned with great precipitation; and the Engliſh proceeded to the conqueſt of Baſſe Terre. Palmiſte, the ſtrongeſt poſt of this diviſion, was ſoon taken; and, after other exploits, the whole iſland ſurrendered, with its dependencies.

The Engliſh did not long retain the laſt of theſe conqueſts. The yellow fever began to diffuſe its ravages, which diminiſhed the number of the armed, and weakened the ſurvivors. From hence, expecting to find the works inadequately manned, a French force approached the coaſt, attacked Fleur d'Epée and other poſts, and recovered them with little difficulty. The Engliſh ſoon regained the poſt of St. Anne, where they put to death about four hundred of the enemy, without loſing an individual of their own party. After various actions, brigadier Symes and colonel Fiſher, with a body of ſoldiers and ſeamen, endeavoured to ſurpriſe the enemy in the night on the heights near Point-à-Petre; but they were ſaluted in their march with ſo ſevere a cannonade, that great confuſion aroſe. A retreat was now ordered; and, for ſome time, from the prevalence of diſeaſe, the troops were almoſt inactive. When the camp at Berville was at length attacked by the French, it was ſo bravely defended that the republican army ſuffered conſiderable loſs; but their repeated exertions conſtrained the Engliſh to capitulate.

After further hoſtilities, Fort Matilda was the only place of ſtrength which the Engliſh retained in Guadaloupe. Here they were beſieged by Victor Hugues for eight weeks; and, as the fort was no longer tenable, they found it expedient to retire in the night. Not long after the loſs of the iſland, the brave captain Faulknor, who had ſo eminently contributed to the reduction of Martinique, loſt his life in an engagement with a frigate near Marie-galante. More than ſeventy men are ſaid to have been killed in the French veſſel, and above one hundred wounded; while only twenty-nine ſuffered in the victorious ſhip.

In the ſanguinary iſland of St. Domingo, the Engliſh had ſo far profited as to acquire ſome territorial poſſeſſions. That iſland, in a remarkable degree, had ſuffered the miſchievous effects of the French revolution. When the people in the mother country aſſerted their right to freedom, the claims of the colonial ſubjects of France were alſo recogniſed; and a ſociety called *les Amis des Noirs*, (Friends of the Negroes,) warmly ſupported the pretenſions of the ſlaves to emancipation, and of the mulattoes to all the privileges enjoyed by the white inhabitants. The declaration of rights promulgated by the national aſſembly increaſed the ferment which the firſt intelligence of the revolution had produced in the iſlands; and violent diſturbances and conteſts were apprehended. Deputies from the different diſtricts of the French part of St. Domingo met by the king's order, to prevent tumults and reform abuſes by ſeaſonable regulations: but their endeavours were oppoſed by the partiſans of the old régime; and the governor diſſolved the aſſembly. Many of the repreſentatives failed to France to juſtify their conduct; and, during their abſence, Ogé, an enterpriſing mulatto, returned to the iſland from Europe for the execution of a ſcheme which had been ſuggeſted to him by Briſſot and Grégoire, who wiſhed that the people of colour, (as the mulattoes were ſtyled,) might be ſtimulated to riſe in arms, and redreſs their own grievances. He found means to excite an inſurrection; but it was quickly ſuppreſſed, and his life was ſacrificed to public juſtice. The claims of his brethren, however, were confirmed by a decree of the ruling aſſembly of the parent ſtate, which admitted them to all the privileges of French citizens, on the 15th of May, 1791. Before the death of Ogé, the negroes had been inſtigated to join the mulattoes in a general rebellion; and the recent decree gave vigour to their intentions.

While a new colonial aſſembly deliberated on the conduct which prudence required at this criſis, the ſlaves in the neighbourhood of Cape François attacked the whites, murdered a great number of them, and deſtroyed the plantations. The inſurrection ſoon ſpread to other diſtricts; and, though many hundreds of the negroes and

their confederates were ſlain in battle, or periſhed by famine, they ſeemed to multiply like the heads of the hydra. In the vicinity of Port-au-Prince, however, the inſurgents agreed to an accommodation, on condition of the obſervance of the late decree; but, about the ſame time, the French legiſlature thought proper to annul it. When the intelligence of this repeal reached the iſland, the mulattoes accuſed the planters and their adherents of inſidious duplicity, and again had recourſe to arms. They deſtroyed a third part of Port-au-Prince by fire, and committed barbarous outrages, which expoſed them, when taken, to ſevere retaliation. Commiſſioners were ſent from France to heal the diſorders of the colony; but they did not ſucceed in their endeavours. A new decree reſpecting equality of privilege was enacted; and new delegates were ſent to enforce it. Theſe men behaved in an abſurd and arbitrary manner, and diſguſted the coloniſts by their rapacity and violence. Having produced by their miſconduct a civil war among the whites, they invited to their aid a body of rebel negroes, who, thus encouraged, perpetrated a horrible ſeries of maſſacres at Cape François, and in June, 1793, burnt the greater part of the town.

The convulſions of the colony induced many of the planters to ſolicit ſuccour from the Britiſh government; and, as they aſſerted the probability of a ſpeedy acquiſition of the whole French diviſion of the iſland, major-general Williamſon was ordered to detach an armament from Jamaica, to take poſſeſſion of thoſe ſettlements which the people might be diſpoſed to ſurrender. Lieutenant-colonel Whitelocke ſailed in conſequence to Jeremie, and received the ſubmiſſion of the inhabitants: the town and harbour of St. Nicolas were alſo given up to the Engliſh; and to theſe poſſeſſions Leogane and other towns and diſtricts were ſoon added. An expedition was undertaken for the reduction of Cape Tiburon; and a bribe was offered to general Lavaux for the ſurrender of Port de Paix. The enterpriſe ſucceeded, and the town was taken on the 2d of February, 1794. The fort of Acul was ſtormed by the Engliſh; but, at Bompard, they were repelled with loſs. They defended Cape Tiburon againſt an army of blacks and mulattoes, who were routed with conſiderable ſlaughter. The arrival of a reinforcement from Great Britain, under brigadier-general Whyte, elevated the hopes of the Engliſh; and preparations were made for the conqueſt of Port-au-Prince. Fort Bizotton was attacked by ſea with little effect; but, when aſſaulted on the land ſide by a ſmall party under captain Daniel, amidſt a violent thunder-ſtorm and torrents of rain, it was taken at the point of the bayonet; and the town was ſoon after evacuated. The French commiſſioners intended to have ſet fire to the buildings, and the veſſels that were in the harbour; but this havock was prevented by the vigilance of the Engliſh. The unhealthineſs of the climate now occaſioned a great mortality among the troops, and checked the extenſion of their conqueſts. They loſt Leogane, were ſeverely haraſſed in the town of St. Marc and at Fort Bizotton, and were deprived of Tiburon by the mulatto general Rigaud.

While theſe operations were going on in the Weſt Indies, the Engliſh on the continent of Europe were intent on the preſervation of Holland; but they were not more fortunate in that object than they had been in their endeavours to ſecure the Netherlands to the emperor. When Moreau had reduced the iſle of Cadſand and the ſtrong town of Sluys, Pichegru advanced with a numerous army againſt the duke of York, and attacked Boxtel and other poſts near the river Dommel, from which he diſlodged his opponents, on the 16th of September, after a vigorous conflict. The fort of Creve-cœur was ſoon taken; and Bois-le-Duc did not long reſiſt the beſiegers. The duke of York, who had removed to the banks of the Waal, was again aſſaulted, October 19, and compelled to retire. In this engagement, a corps of his infantry miſtook a body of the enemy for a party of friends, and being thus ſurpriſed, ſuffered a heavy loſs. His royal highneſs now endeavoured to protect Nimeguen, which was ſeverely haraſſed by a ſiege. A ſally of the garriſon, though many of the French were killed on the ſpot, proved inefficacious: the batteries played with redoubled fury; but, while ſome diviſions of the allies were marching from the town, the French, who were favoured by the treachery of ſome of the inhabitants, were enabled to gain poſſeſſion of it. Maeſtricht ſuſtained a longer ſiege; but, when Kleber threatened a general aſſault, the governor was perſuaded by the inhabitants to capitulate.

When the French attacked fort St. André and the adjacent poſts, they met with ſuch a warm reception, that they were obliged to retreat in confuſion; but, on the renewal of their exertions, they paſſed the Waal, and ſeized the ſtrong poſt of Tuyl. The duke of York and the aſſociated commanders now ordered an aſſault upon this ſtation; and it was executed with great ſpirit, the enemy haſtily re-croſſing the frozen river; but, after a ſhort interval, the poſt was regained by the French. Alarmed at their progreſs, the allied generals reſolved to make vigorous efforts of counteraction. A freſh attack was directed; but the enemy anticipated the aſſault by an impetuous charge at Geldermalſen, which threw the allies into confuſion, though it did not diſlodge them. Reflecting on the danger to which the fatigued and unſheltered troops of the allies were expoſed, the commanders thought it expedient to fall back, and take a poſition on the right bank of the Leck. A ſudden thaw occaſioned the recal of the orders given for that purpoſe; and, though the froſt ſoon returned, major-general Dundas advanced to riſk an engagement, in which he was ſucceſsful. The French ſoon after attacked the Auſtrians and Hanoverians, drove them back, and alſo conſtrained lieutenant-general (afterwards ſir Ralph) Abercrombie to retire. Having taken Heuſden, they aſſailed the whole confederated line from Arnheim to Amerongen; and compelled a retreat, on the 14th of January, 1795.

The ſucceſs of the French republican army induced many of the Dutch to ſeek refuge in Britain, where they were received with politeneſs and hoſpitality. When Utrecht had ſubmitted to the enemy, the ſtadtholder, knowing that Amſterdam would not be defended, left his country to its fate, and eſcaped to England in a fiſhing-boat. He and his family became immediate objects of royal benevolence, and were treated with the reſpect due to their rank and misfortunes. The Dutch, who had viewed the Engliſh with an unfriendly eye ſince the revolution of 1787, appeared to be highly pleaſed at this change in their affairs. They now treated the Britiſh troops with contempt and illiberality, and were not diſpoſed to alleviate, by kindneſs or compaſſion, the ſufferings of the wounded, or the diſtreſs of the fugitives, who at length effected their retreat to Bremen, after a long and ſevere exerciſe of patience and fortitude. The united provinces were now revolutioniſed on the French model, under the name of the *Batavian republic*. But the Gallic friends of the Hollanders, in reſcuing them from what they termed a diſgraceful yoke, have never once permitted them to enjoy real freedom or independence.

During the ſanguinary extenſion of the war in Europe, the king of Great-Britain was anxious to enlarge his connections in Aſia, by an alliance with the emperor of China. The prevailing deſire of commercial advantage, concurring with a wiſh to ſecure the friendſhip of a potentate whoſe influence extended to territories bordering on thoſe of the Engliſh Eaſt India company, induced the king to ſend an ambaſſador to treat with the Chineſe court. The abilities of earl Macartney, who had acquired reputation as governor of Madras, qualified him for ſuch a negociation; and, when he had added to his ſuite ſome able cultivators of ſcience and ſkilful artiſts, he ſailed under the conduct of ſir Eraſmus Gower. He reached the yellow ſea in ſafety, paſſed up the white river to Tong-choo-ſoo, and thence proceeded by land to the metropolis of China. Tchien-Lung, the aged emperor, was then at the palace

of

of Zhe-hol, beyond the celebrated wall which had been erected as a barrier againſt the incurſions of the Tartars. A garden belonging to this manſion was the ſcene of formal preſentation. Here, in a ſplendid tent, the ambaſſador delivered a letter from the Britiſh ſovereign in a box of gold, adorned with jewels; and he was gratified with a reception which the Chineſe conſidered as particularly gracious and honourable. But his interviews with Tchien-Lung were not productive of an alliance. A ſpirit of jealouſy diſinclined the emperor to a treaty; and, after the exchange of mutual preſents, it was hinted that the departure of the ſtrangers would be agreeable. See the particulars of this celebrated embaſſy under the article CHINA, vol. iv. p. 468—498.

When the parliamentary ſeſſion commenced, December 30, the ſpeech from the throne, after an alluſion to the diſappointments and reverſes of the late campaign, ſignified his majeſty's conviction of the neceſſity of perſiſting in the war, as perſeverance alone could produce a ſecure peace; repeated the remark of the violent and unnatural ſyſtem purſued by the republican leaders; and deprecated an imitation of the negociatory and ſubmiſſive example of Holland, as it would involve the ſacrifice of our honour and ſafety to an enemy whoſe chief animoſity was avowedly directed againſt theſe kingdoms.

In this memorable ſeſſion, the very ſingular loan to the emperor, in ſterling money, which drained England of its gold, and occaſioned the bank to ſtop, was, after a long and acrimonious debate, voted, to enable the emperor to employ two hundred thouſand men againſt the French. Mr. Fox ſaid, that the recent defalcation of the king of Pruſſia, immediately after pocketing the Engliſh gold, ought to operate as a caution againſt all advances of money to German princes; and he had no confidence in the efficacy of the propoſed loan; but ſir William Pulteney entertained a high opinion of its probable utility. Lord Grenville had ſo much reliance on the promiſed exertions of his imperial majeſty, that he would rather conſent to make a preſent of the deſired ſum, than loſe the chance of expected benefit. (A preſent indeed it proved.) The marquis of Lanſdown diſapproved all connections with German princes; but lord Hawkeſbury and other peers were more credulous and confident. The loan amounted to 4,600,000l. ſhipped to the continent in ſterling gold! See BANK OF ENGLAND, vol. ii. p. 676.

The long trial of Mr. Haſtings was now brought to a concluſion. After the peers had inveſtigated former modes of proceeding, the lord chancellor diſcuſſed the Benares charge. He conſidered Mr. Haſtings as having acted againſt Cheyt Sing under the influence of perſonal reſentment, (ſee p. 760,) and under the unwarrantable idea of poſſeſſing an unlimited right of exaction in times of emergency; and therefore concluded that the commons had made good that article of accuſation. Lord Thurlow diſputed this opinion, and vindicated the governor-general in elaborate detail, but not always on conſtitutional principles. The earl of Caernarvon ſtrongly contended for his delinquency; while the earl of Mansfield, the marquis of Lanſdown, and the biſhop of Rocheſter, maintained his innocence, and extolled his ſervices. The deciſion of the committee, on different parts of this charge, was, however, favourable to Mr. Haſtings.

In the conſideration of the other charges, lord Thurlow was the chief defender of the governor-general. He maintained that the reſumption of the jaghiers, on the part of the nabob, was a meaſure of ſound policy; that the ſteps taken by Mr. Haſtings to compel that prince to execute a ſcheme which, though it was originally propoſed by himſelf, he was afterwards unwilling to enforce, were meritorious rather than criminal; and that his conſent to the ſeizure of the treaſures involved no criminality, as they were public property. The lord chancellor condemned the concern of Mr. Haſtings in thoſe meaſures, and denied that the begums or their eunuchs had been guilty of rebellious acts. Lord Thurlow entered very fully into the charge reſpecting preſents, controverting the ſtatements and concluſions of the managers. The chancellor alſo differed from the proſecutors with regard to the early preſents; but he agreed with them in the ſubſequent part of the charge. The archbiſhop of York ridiculed this branch of accuſation as frivolous, and lamented the ill return made for the ſplendid ſervices of Mr. Haſtings. The article of contracts did not appear to lord Thurlow in that criminal light in which the managers viewed it; and the biſhop of Rocheſter, though he thought there was ſomething objectionable in the opium contract, did not conſider that point, or any other part of this charge, as criminal: but the chancellor contended that, in moſt of the contracts and agencies, Mr. Haſtings had been profuſe and improvident, and was alſo guilty of diſobedience to the expreſs orders of the directors. When every part of the accuſation had been diſallowed by the committee, the report was reviewed by the houſe; and, after ſome debates on the mode of proceeding, it was reſolved that the queſtion ſhould be ſeparately put on ſixteen points. The greateſt number of peers who voted the defendant guilty in any one reſpect, did not exceed ſix: the votes of innocence, in ſome of the charges, were twenty-ſix; in others, twenty-three; in one, nineteen. The chancellor intimated the deciſion of the court to Mr. Haſtings, on the 23d of April, 1795, who received it in ſilence, bowed, and retired from the bar.

The propriety of this ſentence was chiefly diſputed by the advocates of ſtrict juſtice. The public in general, entertaining leſs rigid notions, ſeemed to be pleaſed with the acquittal of one who had ſuffered ſo long an arraignment, yet had conducted the affairs of his government with ſpirit and ſucceſs, and who, though he had on ſome occaſions diſregarded the duties of morality, the dictates of virtuous policy, or the ſentiments of humanity and moderation, had promoted the intereſts of his employers, ſecured their authority, and eſtabliſhed their dominion.

When the requiſite parliamentary buſineſs was concluded, his majeſty, in his ſpeech, June 27, 1795, acknowledged the zealous and uniform regard which both houſes had ſhown to the general intereſts of the nation, and the prudent, firm, and ſpirited ſupport, which they had continued to afford him in the proſecution of the war. "It is impoſſible, (ſaid the king,) to contemplate the internal ſituation of the enemy with whom we are contending, without indulging a hope, that the preſent circumſtances of France may in their effects haſten the return of ſuch a ſtate of order and regular government as may be capable of maintaining the accuſtomed relations of amity and peace with other powers. The iſſue, however, of theſe extraordinary tranſactions, is out of the reach of human foreſight."

The third year of the war between England and the French republic, commenced with the brilliant ſucceſs which attended the exertions of a ſquadron commanded by lord Bridport (formerly ſir Alexander Hood), early in 1795. That officer attacked the French with an inferior force, and would probably have captured or deſtroyed the greater part of their fleet, if the engagement had been more diſtant from the land; but it occurred near Port l'Orient, and they were conſequently favoured by the fortifications of the place. After an action of almoſt four hours, three of their ſhips ſtruck, and were ſecured in ſpite of all the dangers of a lee-ſhore. This engagement was ſoon followed by another, alike honourable to the Britiſh navy. Vice-admiral Hotham purſued to the Genoeſe coaſt a French fleet, which had ſailed from Toulon with troops intended for the recovery of Corſica, and had captured one of his detached ſhips. He, with great difficulty, brought the enemy to a partial engagement, on the 14th of March, and took two ſail of the line; but he loſt one of the ſhips of his van, in conſequence of the great damage ſhe had received in the action.

Vice-admiral Cornwallis was cruiſing near the Penmarks with eight ſhips, including frigates, when thirteen French

ſail of the line and fourteen frigates made their appearance. The large ſhips came up in ſucceſſion, June 27, and ſlightly fired upon ſome of his veſſels. An attack apparently more ſerious was made upon one which had fallen to leeward; but, even in this ſhip, not a man was killed. Before ſun-ſet, the firing ceaſed; and the timid enemy tacked and ſtood off. The Britiſh fleet, by the exerciſe of a ſmall degree of courage and dexterity on the part of the French, might have been brought to a general action; but their dominion is not on the ſeas: and, as they declined the riſk, it would have been an act of deſperation in the vice-admiral to encounter ſo great a force. His men, far from wiſhing to avoid an action, were eager to engage; but he was not ſo raſh as to let looſe their valour, and rather thought that the eſcape was a fair ground of congratulation, than that the loſs of ſuch an opportunity of exertion was to be regretted. His character, far from ſuffering on this critical occaſion, acquired reputation and praiſe. In the month of July, 1795, the French were again attacked by vice-admiral Hotham, and a ſhip of conſiderable force was taken from them; but it ſoon blew up, with the loſs of about 350 of the crew. After ſome intervening captures on both ſides, the French recovered a ſhip of the line, and took thirty ſail of a valuable Engliſh fleet returning from the Mediterranean. They alſo made prize of part of a Jamaica fleet; and indeed, both in this and the preceding year, the Britiſh trade ſuffered immenſely from their attacks, while their own declining commerce preſented few objects of repriſal for our cruiſers and privateers.

Though the French had been very ſucceſsful on the continent, they were by no means unwilling to diminiſh, by negociation, the number of their enemies. They courted the king of Pruſſia into forbearance, and perſuaded him that his ſafety and intereſt required peace. Satisfied with his rapacious acquiſitions in Poland, and deſpairing of the ſubverſion of the French republic, that prince ſeceded from the confederacy, and concluded a treaty, on the 5th of April, 1795, by which he relinquiſhed his poſſeſſions on the left bank of the Rhine. By another agreement, he ſecured the neutrality, and provided for the peace, of the north of Germany. The king of Spain was alſo induced to agree to a pacification with the victorious republic. In the former part of the year, the French met with great ſucceſs over the troops of the Spaniſh monarch, and threatened him not only with the loſs of conſiderable provinces, but with the propagation of revolutionary doctrines among his people. To avert theſe dangers, the king of Spain purchaſed peace by the reſignation of that part of the iſland of St. Domingo which the Spaniards had poſſeſſed ever ſince the time of Columbus. Even the elector of Hanover, though he remained the moſt active member of the confederacy in his capacity of king of Great Britain, nevertheleſs ordered a treaty of peace to be ſigned with the French, as far as related to the electorate; as did alſo the landgrave of Heſſe Caſſel.

The endeavours of the French convention to reſtore peace and order to thoſe weſtern departments which had bitterly experienced both the dreadful effects of inteſtine war, and the ſanguinary rage of the officers of the government, were ſo far ſucceſsful, that Charette, and other leaders of the mal-contents, ſubmitted to the republic. The peace, however, was of ſhort duration. The ſtandard of royalty was again erected; and the people were invited to promote the claim of Louis XVIII. (for ſo was the count de Provence ſtyled, immediately after the death of the ſon of Louis XVI.) to the throne of France. The Britiſh government favoured the inſurgents with various ſupplies, and ſent a body of emigrants to their aid. But this expedition, which was planned by Mr. Windham, was ill-concerted and diſaſtrous. The royaliſts poſſeſſed no towns on the coaſt, and were too cloſely watched by the republicans to be ready to co-operate effectually with the expected auxiliaries. The ſquadron having reached the bay of Quiberon, the troops landed on the peninſula, reduced fort Penthièvre, and raiſed entrenchments for their defence. The count d'Hervilly advanced into the country with a body of the inſurgents; but they manifeſted no courage, and fled before a ſmall party of the enemy. About five thouſand men afterwards attacked the redoubts which guarded the paſſage to the main land. Two of theſe works were forced; but, in the progreſs of the aſſailing corps, a maſked battery played with ſuch vigour as to produce great confuſion. A rapid retreat enſued; and, if the fire of ſome of the veſſels had not checked the purſuers, the fugitives would perhaps have been completely cruſhed. Many of the French priſoners who had engaged in the expedition, now deſerted the cauſe, and repaired to the ſtandard of the convention, communicating to general Hoche and his officers ſuch information as was calculated to promote the republican intereſt. That commander, profiting by the treachery of his own countrymen, ſurpriſed the fort in the night of July 21, and prepared to attack the camp. While many of the royaliſts, commanded by Puyſaye, diſperſed themſelves over the neighbouring country, the gallant Sombreuil animated the emigrants to a ſpirited reſiſtance: but a conſiderable number refuſed to fight againſt the republic. When the camp was forced after the ſlaughter of many of its defenders, the ſurvivors retired toward the extremity of the peninſula. One body of the enemy approached them in front, while two diviſions marched to the right and left to preclude their eſcape. The Engliſh brought off as many as could reach the veſſels, amounting to about nine hundred of the men who had ſailed from England, and fifteen hundred of the inhabitants. The reſt (about four thouſand in number) being expoſed to extreme danger, deſired to capitulate; but Hoche would only promiſe that they ſhould be treated as priſoners of war, if the convention ſhould approve that indulgence. To this conditional engagement they were obliged to ſubmit; and many of theſe unfortunate men were afterwards ſacrificed by the vindictive ſpirit of the republicans.

The great exertions of the early part of the campaign having rendered a reſpite expedient, it was late in the year before any operations of moment diſtinguiſhed the war in Germany. Jourdan then forced his way over the Rhine, ſtormed the citadel of Duſſeldorff, and reduced the greater part of the duchy of Berg. Pichegru paſſed the ſame river near Manheim, and took poſſeſſion of that garriſon. The former general, having croſſed the Lahn, was attacked by the Auſtrians, and obliged to retreat. They again encountered his army, made a forcible impreſſion on his rear, took four thouſand of his men, and drove him back over the Rhine. General Wurmſer was repelled by the French near Manheim; but his troops returned to the charge, and became victorious. The republican camp near Mentz was attacked by Clairfait, and forced after a ſpirited reſiſtance. Manheim was retaken; and the French were alſo diſpoſſeſſed of ſeveral other towns which they had ſeized in Germany. Some of the rencontres in Italy were unfavourable to the French arms; but the battle of Loano was attended with loſs and diſgrace to the Piedmonteſe and Auſtrians; and the victors were enabled to make effectual incurſions into the adjacent country.

As the Dutch, though nominally independent allies of the French, were eaſily induced to become the enemies of their former friends, letters of marque and repriſal were iſſued againſt them by Great Britain; and directions were given for the ſeizure of their colonial territories, which, however, the king profeſſed his intention of reſtoring, whenever the ſtadtholderian government ſhould be re-eſtabliſhed. Vice-admiral Elphinſtone appeared with a fleet in Simon's-bay, near the Cape of Good Hope; and, as it was ſuſpected that the governor intended to ſet fire to Simon's-town, from which he had ordered all the inhabitants to retire, major-general Craig landed, and took poſſeſſion of the place, but prohibited his men from committing any other act of hoſtility. When the militia, however,

however, fired from the neighbouring hills, it was thought proper to retaliate; and an attack was meditated upon the paſs of Muyſenberg. While a ſelect body advanced with that view, the well-directed fire of ſome veſſels occaſioned an evacuation of the poſt; and a ſpirited aſſault ſoon diſlodged the enemy from a rocky eminence which might have been long defended. After ſome weeks of inaction, an attempt to ſurpriſe the moſt conſiderable of the outpoſts failed; and, though the Engliſh repelled a fierce attack, their efforts did not deter their adverſaries from preparing for a general engagement. At this criſis, the appearance of a Britiſh reinforcement at ſea checked the eagerneſs of the enemy. This force was commanded by major-general Clarke, who, as ſoon as he had made proper arrangements, marched toward Cape-town. At Wynberg, the Dutch made a ſhow of reſiſtance; but they were ſoon driven from the poſt; and, when the vice-admiral had detached four veſſels to bombard that ſide of the town, the governor propoſed a ceſſation of hoſtilities, and terms of capitulation were adjuſted. It was agreed, September 16, that the troops in garriſon ſhould be priſoners of war, and that the property of the Dutch Eaſt-India company ſhould be delivered up to the captors of the ſettlement; but private poſſeſſions and civil rights were left inviolate. Some of the Aſiatic ſettlements of the Hollanders were alſo ſeized by the Engliſh. Trincomalè, in the iſle of Ceylon, was taken by a ſmall armament; and the fort of Ooſtenborg was ſoon after reduced, with Jaffnapatam, and other towns. To theſe acquiſitions were added the colonial diſtricts of the Malay peninſula; and, on the coaſt of Malabar, Cochin was ſeized by a detachment from Bombay.

The Dutch territories in the Weſt Indies were not reduced in this year, as the Engliſh found greater difficulty than they expected in defending the iſlands which they had taken from the French, and in ſecuring thoſe which they poſſeſſed at the beginning of the war. In Grenada, an inſurrection was excited by the arts of the enemy. Many of the French inhabitants and negroes were encouraged to revolt by promiſes of aid; and, on the arrival of a ſmall body of ſoldiers from Guadaloupe, they perpetrated many acts of violence. Their camp was aſſaulted without effect; but they were not ſo ſucceſsful on other occaſions as to be induced to prolong offenſive hoſtilities. In Dominique, likewiſe, an inſurrection took place, and a party of French landed; but the rebels were reduced to ſubmiſſion, and the invaders were either killed or made priſoners. In the iſland of St. Vincent the Caribs roſe in arms, and committed many brutal ravages; and, being joined by the majority of the French coloniſts, they boldly withſtood the efforts of the Engliſh. In St. Lucia ſimilar diſturbances aroſe; and the new poſſeſſors were at length conſtrained to relinquiſh the iſland to the French. Even Jamaica was not free from commotion; for the Maroons were guilty of many cruel depredations, and were not ſubdued till they were hunted down with blood-hounds.

Among the negociations of the year 1795, were an agreement with Spain, and treaties with Ruſſia and Auſtria. His catholic majeſty, before he concluded peace with France, ordered the ſurrender of the lands which (in repugnance to the former convention) he had retained at Nootka. With the court of Peterſburg the king of Great Britain entered into new ſtipulations of alliance; but the only fruit was the appearance of a Ruſſian fleet in the channel. The emperor of Germany was more earneſt than the czarina in the cauſe of the confederacy; and on his engagements the Britiſh court more confidently relied. The Germanic body, wiſhing for the termination of a calamitous war, deſired the emperor to treat with France, under the mediation of the king of Pruſſia. He promiſed to forward the object of this requiſition; but, in reality, he rather checked than promoted it; and the French executive directory refuſed to agree to an armiſtice which was propoſed by the mediator, as a preliminary ſtep to a congreſs.

The probability of ſubduing the French now became very remote and imperfect. They were much more powerful at this time than they had been at the commencement of the conteſt. They were complete maſters of the Netherlands, had a controuling influence over the United Provinces, and had acquired valuable territories in Germany and in Italy. They had alſo ſtrengthened themſelves, in the way of negative ſucceſs, by detaching two powerful princes from the hoſtile confederacy. Yet all theſe conſiderations did not prevent his Britannic majeſty from affirming, in his ſpeech to the two houſes of parliament, October 29, that the proſpect reſulting from the general ſtate of affairs had in ſome important reſpects been materially improved in the courſe of the year. He was of opinion, that the ſucceſs of the French on particular occaſions, and the advantages which they had derived from the concluſion of ſeparate treaties with ſome of the belligerent powers, were far from compenſating the evils which they experienced from the continuance of the war. He ſpoke of "the deſtruction of their commerce, the diminution of their maritime power, and the unparalleled embarraſſment and diſtreſs of their internal ſituation;" yet he did not think that their rulers were ſo humbled by the increaſing preſſure of difficulties, as to be diſpoſed to "negociate for a general peace on juſt and ſuitable terms:" it therefore ſeemed neceſſary to proſecute the war with the utmoſt energy and vigour.

Great Britain, in the campaign of 1796, furniſhed few troops for the continental war, but overwhelmed the emperor with freſh ſupplies of money. In the Weſt Indies, the exertions of the Engliſh were productive of great benefit. They recovered Port-Royal, in Grenada, from the inſurgents, whom they reduced to uncontrouled ſubmiſſion. An armament under ſir Ralph Abercrombie and ſir Hugh Chriſtian ſailed to St. Lucia; and, though the troops failed in an attack of ſome batteries, they carried on their operations againſt the principal fortreſs, which ſurrendered May 15; but not without the loſs of many brave men. In the following month, the poſt of the Vigie, in St. Vincent's, was reduced, and the whole iſland replaced under the Britiſh government.

In South America ſome territorial advantages accrued to this country; for Demerara and Eſſequibo were wreſted from the hands of the Dutch, as was alſo the colony of Berbice. On the other hand, a French ſquadron, ſailing to North America, captured or deſtroyed a conſiderable portion of mercantile property in Newfoundland. In Aſia likewiſe, new conqueſts gratified both the deſire of power and the ſpirit of commerce. Colombo, the capital of the Dutch government in Ceylon, was eaſily reduced; and the valuable iſlands of Amboyna and Banda were likewiſe ſurrendered to Great Britain.

The Dutch alſo ſuffered another loſs not inconſiderable. For the recovery of the Cape of Good Hope, they ſent out a ſquadron with troops on board, which reached Saldanha bay unmoleſted. Sir George Elphinſton failed with as great haſte as the ſtormy weather would allow, and, having anchored within ſhot of the enemy, demanded a ſurrender of the ſhips. As his fleet was far ſuperior to that of the Hollanders, and major-general Craig had made proper diſpoſitions for co-operating by land, the demand was not reſiſted by rear-admiral Lucas, who, Auguſt 17, delivered up his own ſhip of ſixty-ſix guns, two other ſhips of the line, four frigates, a ſloop, and a ſtore-veſſel.

The Engliſh were leſs ſucceſsful in the Mediterranean, being reduced to the neceſſity of evacuating Corſica, which, from the intrigues of the French, the viceroy found great difficulty in retaining. After the retreat of the Engliſh from Leghorn, where the French exerciſed a conſiderable influence, ſir Gilbert Eliot quitted Baſtia, and paſſed over to the iſle of Elba, where Porto-Ferraio had been lately ſeized and garriſoned by his order. Corſica was immediately re-occupied by a body of French republicans, to whom the natives readily ſubmitted.

Military incidents, and attendant negociations, render this period important in the hiſtory of the continent; but as thoſe events come more properly under the reſpective heads or titles of thoſe countries to which they particularly appertain, we ſhall in this place only take a ſlight ſurvey of them. While general Hoche was acting with vigour and ſucceſs againſt the royaliſts of La Vendée, whoſe chiefs, Stoſſlet and Charette, were put to death as rebels, Napoleone Bonaparte carried into the Italian ſtates the terror of the French arms. He engaged the Auſtrians at Montenotte, and, with the aid of Berthier and Maſſena, put them to a total rout. He alſo obtained another victory, of which the Piedmonteſe felt the bitter effects. In a third conflict, he met with ſimilar ſucceſs. Mondovi and other towns were reduced by his active troops; and the king of Sardinia was ſo diſcouraged, that, to procure a ceſſation of hoſtilities, he delivered up ſome of his principal fortreſſes to the victorious army. A peace was ſoon concluded between him and the French, to whom he ceded the duchy of Savoy and county of Nice. The dukes of Parma and Modena, and the king of Naples, alſo purchaſed an armiſtice; and treaties of pacification with thoſe princes followed. Advancing to Lodi, the French encountered general Beaulieu; but they were oppoſed by ſuch ſtrenuous efforts, and ſo tremendous a fire, that victory ſeemed to promiſe itſelf to the Auſtrian battalions. At length, however, the bridge was forced, and the republican army bore down all before it. By this victory Bonaparte gained poſſeſſion of the greater part of the Milaneſe; and, after having quelled an inſurrection of the new ſubjects of France at Pavia, he alarmed the pope by an invaſion of his territories. After thus diſproving his infallibity, he granted the favour of a truce to the pontiff, and proceeded to cover the ſiege of Mantua. The Auſtrians, under the command of general Wurmſer, now obtained ſome advantages over his troops, and compelled him to raiſe the ſiege; but he ſoon retaliated with ſuperior effect. He prevailed in the moſt obſtinate conflicts, and eventually conſtrained Wurmſer to take refuge within the fortifications of Mantua. On the banks of the Brenta, Bonaparte was nearly defeated by Alvinzi; and, at Arcole, he was involved in the greateſt danger; but he finally diſlodged the foe, and after great loſs had been ſuſtained on both ſides, he completely triumphed over the empire of ancient Rome.

The campaign of 1796, in Germany, was opened with ſucceſs on the part of the French, who, led by Jourdan and Kleber, gained the battle of Altenkirchen. The republicans were leſs fortunate in an engagement near the Lahn; but, proceeding to the Mayne, they reduced Franckfort, Wurtzburg, and ſome other conſiderable towns. In the autumn, they were defeated in ſeveral actions, and obliged to recroſs the Rhine with marks of diſgrace. Moreau, who commanded on the Upper Rhine, took the fort of Kehl, and made great progreſs in the enemy's country. At Rhenchen he put the Auſtrians to flight: at Raſtadt he was alſo victorious. He compelled the duke of Wirtemberg to relinquiſh all oppoſition to the French cauſe, and to ſue to the directory for peace, which was granted both to him and the margrave of Baden. He penetrated to the Bavarian capital, and exacted large contributions from the elector, with whom he agreed to a truce. Finding that the emperor was marching againſt him with augmented forces, he commenced a retreat, which he executed with great ſkill and extraordinary judgment. He was expoſed to various difficulties and frequent attacks; but he ſurmounted every obſtacle, and continued his perilous retreat from the Leeh to the Rhine, exciting alike the admiration of his aſtoniſhed adverſaries.

In conformity with the intimations his Britannic majeſty had given of a deſire of reſtoring the bleſſings of peace, he made dignified propoſitions for negociatory conferences; and the French directory, after various ſubterfuges and evaſions, agreed to the propoſal, but did not in the mean time neglect the progreſs of hoſtility, as preparations were ordered for a deſcent on the coaſt of Ireland. While preparations were thus going on for vigorous hoſtility, lord Malmſbury (formerly ſir James Harris) was engaged at Paris in the taſk of negociation with M. Delacroix, the French miniſter. When he had propoſed that a general principle ſhould be eſtabliſhed, as the baſis of definitive agreement, it was long evaded by his diplomatic adverſary; and, when the directory aſſented to its adoption, there was no intention of obſerving the promiſe. Its purport was, that compenſation ſhould be made to France by proportional reſtitutions of conqueſt for thoſe arrangements to which ſhe might be deſired to conſent, in order to ſatisfy the juſt pretenſions of the allies of Great Britain, and to preſerve the political balance of Europe. In conformity with this principle, lord Malmſbury required, That the emperor ſhould be reinſtated in the full poſſeſſion of his dominions; that peace ſhould be ſettled with the Germanic body on a baſis which might not injure or weaken the general ſafety of Europe; that the *ſtatus ante bellum* ſhould, as far as practicability would allow, take place in Italy; and that Ruſſia and Portugal ſhould enjoy the benefit of the negociation, if they were ſo inclined. On theſe conditions the king promiſed to reſtore all the territories which his armies had taken from the French ſince the beginning of the war. With regard to the Dutch, he would not engage for the reſtitution of conqueſts, unleſs the political ſituation in which they ſtood before the war ſhould be reeſtabliſhed.

Some of theſe terms were declared by M. Delacroix to be inadmiſſible, as they would unreaſonably diminiſh that degree of power to which France, in conſideration of the increaſing ſtrength of other European ſtates, was fairly entitled; and he particularly oppoſed the disjunction of the Netherlands from the French dominions. On this demand lord Malmſbury peremptorily inſiſted, though he hinted that France might be allowed to retain a part of her German conqueſts, beſides Savoy and Nice. After a long conference on theſe points, he received a note, requiring the delivery of an ultimatum within twenty-four hours. He remonſtrated againſt this arbitrary preclufion of deliberate negociation, and requeſted a *contre-projet* on the part of the directory, that the propoſals of both parties might be fairly weighed, and mutually diſcuſſed with conciliatory candour. This reaſonable requeſt was anſwered, December 19, 1796, by a determined refuſal of reſtoring any country which had been conſtitutionally annexed to the republic; accompanied with an order for his departure from Paris within two days, and his expeditious retreat from the French territories. This inſult was qualified by alleging that his part in the negociation was merely paſſive, as he was obliged to ſend, on every occaſion, for the advice of his court, and that a negociation might eaſily be carried on by the channel of couriers.

While the people lamented the failure of the negociation, they were pleaſed at the ill ſucceſs of the French ſcheme of invaſion. Seventeen ſhips of the line, and many ſmaller veſſels, ſailed from the coaſt of France, with an army exceeding eighteen thouſand men. An application had been made to the directory by the republican ſociety of United Iriſhmen, whoſe agents repreſented in perſuaſive terms the probability of a general inſurrection againſt the government. Deluded by this exaggeration, the French ſent out their fleet, and intruſted Hoche with the command of the troops. A part of the armament caſt anchor in Bantry-bay, and remained there for ſome days, without an attempt to invade the country. Having waited in vain for the reſt of the fleet, the ſhips ſailed away. Others afterwards made their appearance; but the violence of the wind prevented that rendezvous which was neceſſary for the ſucceſs of a deſcent; and the continuance of ſtormy weather defeated the views of the

enemy.

enemy. A frigate was taken by the Engliſh; two others foundered at ſea; one ſhip of the line was alſo loſt; and another, running on-ſhore, was deſtroyed.

An invaſion of Wales was next attempted; but it excited ridicule rather than terror. About 1250 men diſembarked in the county of Pembroke, February 22, 1797; and, as the ſhips in which they arrived left them unprotected, they ſubmitted to a demand of lord Cawdor for their ſurrender. Of the four veſſels which thus inſulted our weſtern coaſt, two were taken by our cruiſers.

An extraordinary meaſure followed the meeting of parliament. The unbounded remittances, in *caſh*, to the emperor, and other foreign princes, and the recal of caſh from all the banking-houſes for the purpoſe of raiſing the ſums required, had alarmingly diminiſhed the circulation of coin; and, after frequent conſultations with the directors of the bank, the embarraſſed directors and miniſters diſcuſſed the affair in council. From theſe deliberations reſulted an order, February 26, 1797, againſt the iſſue of caſh from the bank; an act of policy which, though it did not demonſtrate inſolvency, filled the minds of the timid with the dread of national bankruptcy. See the article BANK OF ENGLAND, vol. ii. p. 676.

When French influence, operating on the fears of the Spaniſh monarch, had produced a peace between the nations, there was reaſon to ſuppoſe that the artful republicans would lead that paſſive prince into a cloſe alliance, and endeavour to render his arms ſubſervient to the views of France. This effect did not immediately follow, as the Spaniards were not very eager to commence hoſtilities againſt their late allies; but a treaty of confederacy was at length concluded, and war was declared againſt Great Britain by his catholic majeſty, on frivolous and abſurd pretences, on the 5th of October, 1796.

Naval and military preparations were expedited; and, while an army threatened an irruption into the Portugueſe territories, a conſiderable fleet ſailed from Cadiz to join a French ſquadron. Sir John Jervis deſcried this fleet to the ſouth-weſt of Cape St. Vincent, February 14, 1797; and, though he had only fifteen ſail of the line, he reſolved to riſque an engagement. He was ſo fortunate as to reach the enemy before a regular line could be formed to oppoſe him; and, by a ſkilful manœuvre he ſeparated one third of the enemy's ſhips from the main body. The intrepid Nelſon and Troubridge, in the Captain and Culloden men of war, highly diſtinguiſhed themſelves in this action. For ſome time, their ſhips were engaged with ſix of the Spaniſh veſſels, out of twenty-ſeven ſail of the line. At length they were aſſiſted by the Blenheim; and the exertions of captain Collingwood, in the Excellent, greatly contributed to make them victorious. Nelſon, when his ſhip was diſabled, prepared to board the San Nicolas; and his orders for that purpoſe were executed with promptitude and alacrity. The cabin door was forced by ſome marines; and, ruſhing upon the quarter deck, he found that captain Berry was nearly maſter of the ſhip. When all oppoſition was ſubdued in this veſſel, the San Joſef was boarded; and the commodore received the ſwords of the Spaniſh officers. The conflict was but partial, though other ſhips, beſides thoſe which we have particularized, had a ſhare in it; and, when the action ceaſed, four ſhips from 74 to 112 guns were prizes to the Britiſh fleet. In the Engliſh ſhips 73 were killed and 227 wounded; while, in the captured veſſels, above 600 are ſaid to have ſuffered. The conduct of the victorious admiral was honoured with general applauſe; and he was advanced to the peerage with a title drawn from the cape near which he triumphed.

Nearly at the ſame time, a Britiſh armament appeared before Trinidad, a conſiderable iſland to the ſouthward of Tobago. Four Spaniſh ſhips of the line and a frigate being ſeen in the bay, apparently ready for ſailing, diſpoſitions were made to obſtruct their eſcape. In the night, one veſſel was perceived to be on fire; three others were ſoon after involved in the flames and deſtroyed, while one, of ſeventy-four guns, was taken by the Engliſh. The troops under ſir Ralph Abercromby landed without oppoſition: the chief town was not defended; and the governor tamely reſigned the whole iſland, February 18, 1797. The ſame ſucceſs did not occur at Porto-Rico; for, though a deſcent took place on the main iſland, the troops were unable to force a paſſage to the iſle on which the capital is ſituated: they therefore retired, after an ineffective bombardment of the garriſon.

The exertions of the Britiſh navy during the war, had been highly uſeful and important; and, as their merit was a conſtant theme of univerſal praiſe, they were induced to take the opportunity of demanding not only an advance of wages proportioned to the increaſed price of the articles which they were obliged to purchaſe, but alſo an enlargement of the quantity of proviſions allowed to them by government. An application to lord Howe being diſregarded, they reſolved to enforce redreſs by ſpirited behaviour. When orders were given to prepare for putting to ſea, the crew of the Queen Charlotte, and other ſhips lying at Spithead, refuſed to act; and, treating with contempt the remonſtrances of the officers, they made choice of delegates, who, after a formal conſultation, drew up petitions to the board of admiralty and the houſe of commons. Earl Spencer, the naval miniſter, dreading a mutiny, and not thinking the demands unreaſonable, promiſed compliance; and the king offered full pardon to all who ſhould immediately return to their duty. The ſeamen, however, would not declare their ſatisfaction before the parliament had confirmed the promiſes of the lords of the admiralty; and, as this ſanction was unneceſſarily delayed, the irritation of their minds led to a conteſt with vice-admiral Colpoys, May 7, in which ſome lives were loſt. A bill was in conſequence enacted for relief of the ſeamen, in point of pay and allowance; and ſubordination was happily reſtored at Spithead and at Plymouth.

The grant of theſe claims, however, encouraged the ſeamen at the Nore to inſiſt on a greater freedom of abſence from their ſhips while in harbour; on a more punctual diſcharge of arrears; a more juſt diſtribution of prize-money; and a general abatement of the rigours of diſcipline. The chief fabricator of theſe demands was Richard Parker, a man of a daring ſpirit, who acted as preſident of the ſeamen's council of delegates. Having received an unſatisfactory anſwer from the board of admiralty through the medium of vice-admiral Buckner, he boldly ſuperſeded the authority of that commander, and the other officers of the ſquadron, and conducted himſelf with ſingular arrogance. He required the perſonal attendance of ſome of the lords of the admiralty at Sheerneſs, and to ſignify their aſſent to the new demands; but, as they gave no hopes of conceſſion, he treated them with rudeneſs and inſolence. He prevailed upon the men to reject the repeated offers of pardon: he robbed two merchant ſhips of their proviſions, and obſtructed commerce by the detention of others; and he fired on ſome men of war that refuſed to accede to the mutinous combination.

The parliament being requeſted to interfere on this alarming occaſion, a bill was propoſed for the infliction of capital puniſhment on every one who ſhould hold communication or intercourſe with the crew of ſhips declared to be in a ſtate of rebellious mutiny, as well as on all who, after ſuch declaration, ſhould voluntarily continue on-board. This bill, and one equally ſevere againſt all attempts to ſeduce ſeamen or ſoldiers into mutinous practices, was paſſed on the 6th of June. Theſe acts, concurring with the ſtrong diſapprobation with which the public in general viewed the conduct of the mutineers at the Nore, accelerated the ſuppreſſion of the diſturbances. A returning ſenſe of loyalty, and the hope of obtaining that indulgence which the lords of the admiralty were authoriſed to grant at their diſcretion, produced a ſeparation of ſome of the ſhips from the reſt, and

the

the mutiny gradually ſubſided. Parker, when the crew of the Sandwich ceaſed to ſupport him, was taken into cuſtody; and, being tried by a court-martial, was condemned to death. He was hanged at the yard-arm, June 30, in the ſhip which had been the ſcene of his defection. Seven of the delinquents were afterwards put to death; and, at different times, the ſame fate attended others; but a pardon was granted to the far greater number of thoſe who were condemned. The French, whoſe revolutionary principles had certainly ſome weight in producing theſe commotions, exulted at the intelligence of the mutiny; and, while they lamented its extinction, conceived hopes of the eruption of future diſcontent in the ſame branch of the ſervice, or in the military department; but the true-hearted ſeamen reſumed their habits of order and ſubmiſſion, and the ſoldiers, who alſo received an augmentation of pay, preſerved their loyalty unimpaired.

The ſailors in the fleet of the earl of St. Vincent were totally uninfected with the mutinous ſpirit which had appeared at the Nore. After the defeat of the Spaniſh ſquadron, they blocked up Cadiz, and captured the ſtraggling ſhips of the enemy. Rear-admiral Nelſon repelled an armed flotilla, and bombarded the town with ſpirit. Being ſent by the earl to Teneriffe, he projected a nocturnal attack upon the town of Santa Cruz. The mole was ſtormed, July 25; but the aſſailants could not reduce the fort; and the danger of continuing on the iſland induced them to aſk for a ſafe retreat, which the governor, intimidated by their menaces, allowed. In this bold enterpriſe, captain Bowen was drowned, as were alſo about one hundred ſeamen and marines; the rear-admiral Nelſon on this occaſion loſt his arm; and 150 men were killed or wounded in the aſſault.

Though the diſcomfiture of the Spaniards off Cape St. Vincent baffled the maritime views of the French, the ſucceſs of the continental war afforded them ample compenſation. In the firſt month of the year, Bonaparte repeatedly triumphed over the Auſtrians in the Veroneſe, particularly near the lake of Garda. Mantua, after a long and murderous ſiege, was obliged to ſurrender; and the general then directed his courſe toward the papal dominions. He received the ſubmiſſion of the whole country in his progreſs, and compelled his holineſs the pope to cede Ferrara and other provinces, and grant a conſiderable ſum of money, beſides valuable pictures, ſtatues, and manuſcripts, as the only terms of being ſuffered to retain the reſt of his territories. Returning towards the dependencies of the Venetian ſtate, Bonaparte advanced againſt the archduke Charles, who, after he had diſpoſſeſſed the French of Fort-Kehl, had aſſumed the command of the Auſtrian army in Italy. He croſſed the Piavè with little difficulty; but the Tagliamento was defended againſt him by the bold efforts of the archduke, who could not, however, ſecure a victory. The French now ruſhed into the hereditary dominions of the emperor, and reduced Gradiſca, Goritz, and Trieſte. Having invaded Carinthia, Maſſena defeated the archduke at Tarvis, while Joubert met with uninterrupted ſucceſs in the Tyrol. Laubach, the capital of Carniola, was taken; the province of Styria was threatened with an overwhelming torrent; and the circle of Auſtria trembled to its centre. Yet, affecting a ſpirit of peace and philanthropy, the French commander made overtures of accommodation to the archduke. The terrified court of Vienna aſſented to an armiſtice; and preliminaries of peace were ſigned near Leoben, on the 18th of April, to the great diſguſt of the Britiſh miniſtry, without whoſe knowledge and concurrence they were adjuſted, though the war had been carried on wholly at their expence.

The Venetian government having teſtified a partiality for the Auſtrians, and encouraged the hoſtilities of its ſubjects againſt the French, Bonaparte reſolved to revolutioniſe that ſtate. Many of the inhabitants of the capital anticipated his views; and ſome democratic innovations were in force when the French arrived. That conſtitution which had long been the boaſt of Italy was eaſily ſubverted; and an executive directory, under Gallic influence, aſſumed the adminiſtration. The Genoeſe ſtate was democratiſed with equal facility; and the Ciſalpine republic, which the French general had erected on the conqueſt of the duchy of Milan, was enlarged and ſtrengthened by his victories and vigilance.—Yet let it be ever recollected, that the Italians *would not fight*; their degeneration from the ancient Roman invincible ſpirit, was never ſo conſpicuouſly demonſtrated; and Bonaparte might be truly ſaid to have gained rapid conqueſts over whole provinces that *courted a revolution*, and that *rejoiced in being beaten*.

At a time when the moderate party prevailed in the two councils at Paris, the Engliſh court, in conformity with the wiſhes of the people, again offered to negociate; and lord Malmſbury and Le-Tourneur met at Liſle for that purpoſe. The former, in lieu of the territories which were to be conceded to the French, demanded the ceſſion of Trinidad, the Cape of Good Hope, Ceylon, and the ſettlement of Cochin; but the French miniſter replied, that the republic would not allow Great Britain to retain any one of theſe conqueſts; upon which, September 5, the negociation was diſmiſſed. A declaration from the king of Great Britain announced to the world this new proof of the hoſtile ſpirit of the rulers of France, and aſſerted his eager deſire of putting an end to a war "ſo deſtructive in its progreſs, and ſo burthenſome even in its ſucceſs." He added, that, though "his claims had been ſtrengthened and confirmed" by a recent victory, he was "yet ready (if the calamities of war could then be cloſed) to conclude peace on the ſame moderate and equitable principles and terms which he had before propoſed."

The victory to which his majeſty referred, was that of the fleet which engaged the Dutch. Admiral Duncan, during the ſummer, had blocked up the ſhips of that nation in the harbour of the Texel. When he retired for a ſhort time, admiral de Winter ſailed out with a view of reinforcing the French, and flattered himſelf with the hope of eluding the Engliſh; but captain Trollope, October 11, diſcerned the fleet in its progreſs, and his ſignals were obſerved with joy by admiral Duncan, who inſtantly ordered a general chaſe. Finding that an engagement could not with honour or ſafety be avoided, the brave de Winter formed a line at no great diſtance from the land between Camperdown and Egmont. Senſible of the advantage of getting between the Dutch ſhips and the ſhore, the Britiſh commander made ſignals for bearing up, breaking the line of his adverſaries, and engaging them to leeward. The conflict began with an attack upon the enemy's rear, by that diviſion which was under vice-admiral Onſlow; and both parties fought with great courage. The admiral, encountering the van, ſoon paſſed through the line, and was cloſely engaged for two hours. The ſhip occupied by de Winter contended at one time with two, and afterwards with three, of the Britiſh ſhips. About 250 of her men were killed or wounded; and ſhe was diſmaſted and a wreck before ſhe ſurrendered. Vice-admiral Reyntjes was wounded, and obliged to ſtrike to his antagoniſt, Onſlow. One of the Dutch ſhips took fire; but the flames were happily extinguiſhed, and ſhe was captured. Six other ſhips of the line and two frigates were taken, out of twenty-one; to which ſixteen Engliſh ſhips, excluſive of frigates, had been oppoſed. Above 750 of the Engliſh were killed or wounded; and the loſs of captain Burgeſs, who brought the Ardent into action in the moſt gallant and maſterly manner, was moſt particularly regretted.

In the week which followed this memorable engagement, a definitive treaty, between the emperor and the French republic, as hinted above, was ſigned, October 17, at Campo-Formio, near Udina. The Netherlands were ceded by the emperor; who alſo conſented that the Venetian iſlands in the Levant, and territories in Albania, ſhould

ſhould be poſſeſſed by the French, on condition of his enjoyment of the city of Venice, and the chief dominions of that ſtate. Renouncing all right to the Milaneſe, he acknowledged the independence of the Ciſalpine republic. By ſecret articles, the left bank of the Rhine was allowed as a boundary to France; a part of Bavaria was aſſigned to the houſe of Auſtria; and the princes injured by theſe arrangements were to be indemnified by the grant of other territories within the empire. On the injuſtice of the contracting parties, in combining to degrade and plunder the Venetians, ſtrong cenſures may be laviſhed without the imputation of ſeverity.

As the peace with the emperor left ſeveral French armies unemployed, the directory proclaimed an intention of ſending a conſiderable force to attempt a deſcent on the Britiſh coaſt; and, while preparations were expedited in the ports of France, Flanders, and Holland, as if ſuch an intention really prevailed, the parliament of England aſſembled, on the 2d of November, 1797. In the ſpeech from the throne, the long delay and final breaking up of the negociation, were attributed to "the evaſive conduct, the unwarrantable pretenſions, and the inordinate ambition, of the French; and, in particular, to their inveterate animoſity againſt theſe kingdoms." Being thus compelled to perſevere in hoſtilities, his majeſty had the ſatisfaction of knowing that the country poſſeſſed means and reſources proportioned to the nature and demands of the conteſt. The ſtate of the war, he thought, would admit ſome diminution of charges: but a heavy expence was ſtill unavoidable; and the "true value of any temporary ſacrifices could only be eſtimated by comparing them with the importance of effectually ſupporting public credit," and convincing the enemy of the unconquerable ſpirit and undiminiſhed power of the nation.

In the mean while an inſurrection, fomented by the French, broke out in Ireland, the ſecret plans of which were imparted to the lord-lieutenant by ſome of the conſpirators, by whoſe means the capital was preſerved from danger. But, in other parts of the province of Leinſter, rebellion diſplayed its horrid features, and ſcenes of ſanguinary havoc aroſe. A body of catholics, on May 24, 1798, chiefly armed with pikes, ſurpriſed a ſmall town called Proſperous, and maſſacred many of its inhabitants. Another party attacked Naas; but the aſſailants were ſpeedily repelled, with the loſs of above one hundred of their number. The rebels were alſo defeated in an engagement near Kilcullen. A more important affair happened near Dunlavin, where they are ſaid to have loſt three hundred men. On the hill of Taragh, an action proved fatal to three hundred and fifty of the inſurgents; and, at Catherlogh, four hundred periſhed, with little injury to the defenders of the town. Near Kildare, above two hundred of the rebels were killed, principally in conſequence of a miſtake, when they were on the point of ſubmitting; and the number of victims would have been conſiderably greater, if a prohibition of ſlaughter had not humanely arrived from lieutenant-general Dundas.

The catholics of Wexford commenced hoſtilities under the conduct of a prieſt; and, having cruſhed a party of militia, attacked Enniſcorthy, of which they gained poſſeſſion with the loſs of about three hundred men. Wexford, being weakly garriſoned, was now a ſcene of alarm and confuſion, particularly as many of the inhabitants were ſuppoſed to be diſaffected; and the troops took an opportunity of evacuating the dangerous poſt. The roads were covered with men, women, and children, ſeeking refuge from rebellious fury; and, as the inſurgents were reinforced in their progreſs, a general conſternation prevailed. A numerous body of revolters made an attack upon Roſs, June 5, and were not defeated without great difficulty. About fifteen hundred of their number fell on this occaſion, and two hundred and thirty of the loyal party were killed. An atrocious maſſacre was committed by a party of rebels who fled from the field. Above two hundred proteſtants, confined at Scullabogue, were pierced with pikes, or burnt alive.

The town of Arklow was ſo vigorouſly aſſaulted, that a retreat was meditated by the loyal forces; but a more manly reſolution was ſoon adopted; and perſeverance put the rebels to the rout, after the fall of 350 of their aſſociates. The Durham fencibles acquired great reputation by their courage and firmneſs on this occaſion. In this part of Ireland, the war ſeemed to take a religious turn, the inſurgents being more intent on the ruin of the proteſtants than on political reform. But, in the north, the latter object was predominant. A party of rebels, chiefly proteſtant diſſenters, took poſſeſſion of Antrim, which, however, they ſoon loſt. At Ballinah-inch, about four thouſand men were routed by fifteen hundred under major-general Nugent; and the northern inſurrection was now quickly ſuppreſſed.

Vinegar-hill, near Enniſcorthy, was for ſome weeks the chief ſtation of the ſouthern revolters, and the ſcene of their vindictive barbarities. Being attacked by general Lake, it was forced with unexpected facility, June 21; but the far greater part of the rebel army avoided deſtruction by flight. At Goff's-bridge, a well-conteſted battle terminated in the flight of the king's enemies; and, on the approach of a reſpectable force, Wexford was quitted by its inhuman captors, after the ſacrifice of many of the friends of government. A rapid diſperſion took place; yet acts of hoſtility and outrage were not wholly diſcontinued. A ſyſtem of moderation ſoon followed the appearance of the marquis Cornwallis in Ireland. After the capital puniſhment of the ring-leaders Harvey and Colclough, (who were taken in a cave formed in one of the Saltee iſlands,) and of other active encouragers of the revolt, a proclamation of pardon was iſſued, which, though it made ſome exceptions, happily promoted the reſtoration of tranquillity.

When only the faint ſparks of expiring rebellion could be perceived, Auguſt 22, 1798, three frigates appeared in the bay of Killalla, having above one thouſand French ſoldiers on board, under the command of Humbert, who had riſen from the ranks to the dignity of a field-officer. This petty invaſion diffuſed great terror over the country; but the enemy had no reaſon to expect important advantages, as they were joined by few of the natives. Humbert boldly marched to Caſtlebar, where a battle enſued, Auguſt 28. He profited by the conſternation which the exaggerated report of the number of his army had produced; and his opponents, though they were commanded by general Lake, yielded to the impetuoſity of his attack. He was favoured by the treachery of many whoſe duty it was to reſiſt the enemy with vigour, but who took an opportunity of deſerting. After this exploit, Humbert advanced toward Sligo, and routed a detachment near Colloony; but here his ſucceſs ended. While the marquis Cornwallis was approaching with a great army, general Lake took another route for the interception of the invaders. A part of his force, overtaking the French rear-guard at Ballinamuck, September 8, made a briſk attack, upon which two hundred threw down their arms. Some officers were riding up to ſummon the reſt to follow this example, when a fire of cannon and muſquetry ſeemed to announce an intention of reſiſtance. A battalion of light infantry immediately attacked the invaders; and, after a ſhort action, the appearance of the remainder of the troops intimidated the French into an unconditional ſurrender. The rebel Iriſh, at the ſame time, fled in all directions; and they ſuffered ſeverely in their confuſed retreat. Only three Britiſh ſoldiers were killed in this engagement; and very few were wounded.

A more conſiderable invaſion would certainly have been attempted by the French, if ſir John Borlaſe Warren had not diſcovered the hoſtile armament, compoſed of a ſhip of the line and eight frigates, carrying a military force

and a great quantity of ſtores for Ireland. He loſt no time in commencing an engagement, and was ſo ſucceſsful as to capture, October 12, the principal ſhip, and ſix frigates. Wolfe Tone, one of the founders of the ſeditious ſociety, being taken with the French, was condemned by a court-martial to the death of a traitor; but he avoided the ſentence by ſuicide.

The terror of the Britiſh arms, in the campaign of 1798, did not operate with important effect on the affairs of the continent. The weak remains of influence, enjoyed in Holland by the ſtadtholder, could not prevent the French from drawing their Batavian allies into a ſtate of more implicit ſubmiſſion than that which had been adjuſted at the firſt offer of democratic fraternity. Nor could the menaces of the Britiſh cabinet ſecure the cantons of Swiſſerland from that yoke to which, after a fruitleſs reſiſtance to an invaſion from France, they were unjuſtly ſubjected. The ſame thirſt of dominion prompted the French to violate their engagements with the pope, and erect the territories of the church into a commonwealth dependent on their power. With their uſual oſtentation, they boaſted of their glorious efforts for the ruin of a tyrannical theocracy, and the revival of the Roman republic. The depoſed pontiff, exiled from his country, died a priſoner in France. Among the numerous changes which had occurred from the time of the French revolution, theſe events were not undiſtinguiſhed; they were, indeed, momentous and memorable; but their details belong to other departments of this work. See the articles FRANCE, SWISSERLAND, ROME, &c.

An expedition was undertaken in the ſpring of 1798, againſt the Netherlands. Major-general Coote landed with a ſmall force near Oſtend, and prepared to deſtroy the ſluices of the Bruges canal. This ſervice was executed; but, as the wind and ſurf prevented the re-embarkation of the troops, it became neceſſary to form a defenſive poſt on the ſand hills. An attack was made upon the invaders by a body which far out-numbered them; and, though they fought with diſtinguiſhed courage, their front was broken, and their flanks were completely turned. In this perilous ſtate, their commander, who was wounded, called major general Burrard to a conſultation; and it was reſolved that a general ſurrender ſhould take place. About fifty men were killed, and above eleven hundred ſubmitted themſelves priſoners of war.

This trivial diſgrace was ſoon compenſated by a ſignal victory obtained in the ſummer of 1798, over the French fleet, on a coaſt rarely viſited by Britiſh ſhips of war. Deſirous of ſeizing Egypt, and ſubjecting that rich province to the dominion of France, the directory ſent out a fleet of thirteen ſhips of the line for that purpoſe, with many frigates and ſloops, and tranſports containing a numerous army, under the command of Bonaparte. The advantageous ſituation of Malta prompted the general firſt to aim at the reduction of that iſland; and, being favoured by the treachery of a garriſon which might have reſiſted the beſiegers for many months, he procured from the Malteſe knights a ſurrender of their whole territory. Proceeding to the Egyptian coaſt, he hoped there to eſtabliſh ſuch a baſis of military, naval, and commercial, ſtrength, as might eventually lead to the ruin of the Britiſh power in India. But the Britiſh ſquadron, commanded by rear-admiral ſir Horatio Nelſon, after a long ſearch for the fleet of the republic, diſcovered it in the bay of Aboukir, Auguſt 1, 1798. An equal number of ſhips of the line appeared on both ſides; but the weight of metal and number of men were decidedly in favour of the French, who had alſo the advantage of ſituation, and the protection of gun-boats and a battery. Captain Foley, in the Goliah, commenced the action near the cloſe of day, by attacking Le Guerrier, which, by broadſides from that and other ſhips, was ſoon diſabled. Le Conquerant was reduced to a ſimilar ſtate, chiefly by the fire of the Goliah. Nelſon's flag-ſhip, the Vanguard, then took an active part in the engagement; and, when he had been wounded in the head, his captain (afterwards ſir Edward Berry) ably ſuperintended the operations. Two veſſels encountered l'Orient, which bore the flag of admiral Brueys; and this large ſhip, which mounted 120 guns, at length took fire, and blew up. The tremendous exploſion produced a momentary ceſſation of firing: but the conflict was again renewed; and it terminated in the capture of nine French ſhips of the line. To which we may add the burning of the Timoleon, and of a frigate, and the ſinking of another ſhip of war. See all the particulars of this expedition and the glorious ſucceſs of the Britiſh arms in Africa, under the article EGYPT, p. 329—343, of this volume.

The grand ſignor, who holds a nominal ſupremacy over Egypt, was provoked by this invaſion to declare war againſt France. But more important benefits were expected from the arms of the Ruſſian emperor Paul, who, now leagued with the Porte, took an active part in the war. His magnanimity was panegyriſed by the king of Great Britain, in a ſpeech to the parliament, and the ſucceſs of his arms for a time excited the admiration of Europe.

In the meanwhile an Engliſh armament failed toward the iſland of Minorca; and a deſcent was made near the creek of Addaya. A body of Spaniards threatened to ſurround the firſt diviſion of the invading army; but they were ſoon repelled; and the Britiſh troops gained a poſition from which they might have attacked the enemy with advantage, if the latter had not retired. The army ſeized the poſt of Mercadal, and a detachment took the town of Mahon and fort Charles. The chief defence was expected at Ciudella, where new works were added to the old fortifications. The approach of the Engliſh drove the Spaniards within the walls of that town; and general Stuart ſummoned the governor to ſurrender without delay. To enforce compliance, two batteries were erected; but, as the invaders had few of the requiſites of a ſiege, their adverſaries might, with a ſmall ſhare of ſpirit, have made a conſiderable reſiſtance. Intimidated, however, by the movements of the troops and the appearance of the ſquadron, the garriſon capitulated, November 15, and the whole iſland was reduced without the loſs of a ſingle man.

In St. Domingo, however, the Engliſh were unable to extend their acquiſitions; and the fury of diſeaſe made alarming havock among them. At length, they reſolved to ſurrender Port au Prince and St. Marc to Touſſaint, a negro commander, who had nearly annihilated the dominion of the French in the iſland; and, in the courſe of the year, they evacuated every other poſt. Such were the chequered ſcenes of the campaign of 1798; but the balance of victory, of diſintereſted policy, and of ſucceſs in arms, (the affairs of Egypt taken into the ſcale,) preponderated greatly in favour of England.

When the emperor of Germany agreed to a pacification with the French, he ſtill cheriſhed the high pretenſions which had urged him to take arms againſt the revolutioniſts; and, in conſenting to a treaty, he rather ſought a reſpite than a durable peace. The French, by their unbounded encroachments on the rights of other nations, gave him a plauſible pretence for re-arming; and the perſuaſions of Great Britain, and the preparations of Ruſſia, confirmed him in reſolutions of hoſtility. While the Ruſſians were on their march, the directory inſiſted on the exertions of the emperor to enforce the retreat of thoſe troops; but as all remonſtrances on this head were diſregarded, one French army recommenced hoſtilities in Germany, while another entered the Griſon territories, and engaged the Auſtrians near Coire. The former hoſt ſuſtained a defeat near Stockach, and ſoon repaſſed the Rhine. The latter ſubdued the Griſons, but afterwards received ſevere checks. A detachment from the army of the archduke Charles drove the French from Schaffhauſen;

hauſen; and ſome ſpirited actions put that prince in poſſeſſion of Zurich. Italy again became the ſcene of remarkable events. In the preceding winter, the French had unjuſtly deprived the king of Sardinia of Piedmont, and formed a republic of that principality; and, as the king of Naples, influenced by the Britiſh court, had attacked their troops in the Roman ſtate, they ruſhed into his dominions, took Capua, and, after a great ſlaughter of his ſubjects, ſeized his capital. In the ſpring, they invaded Tuſcany, and depoſed its ſovereign for pretended acts of perfidy. But their progreſs in the Veroneſe was checked by general Kray, who reſcued Verona from their power, defeated them near Magnan, conſiderably thinned their ranks, and haraſſed them ſeverely by his activity and vigilance.

The Ruſſians, alſo, under Suwarrow, joined by an Auſtrian army, ſtormed the poſts near the Adda, and obtained an important victory over Moreau; and, April 27, 1799, entered Milan in triumph. Having weakened his force by ſending off numerous bodies upon different enterpriſes, the Ruſſian commander encouraged the French to attack him in the Modeneſe; but he prevailed againſt them in an obſtinate conflict, June 19, deſtroying many thouſands of the French troops. Turin, Aleſſandria, and Mantua, were reduced by the confederates, who alſo ſignalized their courage with victorious effect in the battle of Novi. Aſſiſted by Britiſh ſeamen, the Neapolitans acted with unuſual alertneſs againſt their republican oppreſſors. Captain Troubridge reduced fort St. Elmo, took Naples and other towns, and afterwards contributed to a counter-revolution in the Roman ſtate. A ſimilar change was effected in Tuſcany by the ſpirit of an exaſperated people. Suwarrow, after his great ſucceſs in Italy, directed his courſe toward the Swiſs territories. Maſſena, who had defeated an army of the allies near Zurich, encountered the Ruſſian general without diſmay, and impeded his advance. He alſo checked the career of Korſakoff, and ſecured the aſcendancy of the French in Swiſſerland.

While theſe incidents occurred in Europe, a new war broke out in India. It was of very ſhort duration; but its progreſs and reſult were important. On the departure of that fleet which was deſtined for Egypt, the commiſſioners for the affairs of India, apprehending that the company's ſettlements were endangered by the armament, ſent out ſhips of war and troops for the defence of thoſe poſſeſſions. The governor-general, the earl of Mornington, afterwards marquis of Welleſley, who ſucceeded ſir John Shore, had already made diſpoſitions for counteracting the views of Tippoo, as the ſultan had received a ſmall force from the Mauritius, and expected a greater aid for an attack of the Engliſh, againſt whom the immediate hoſtilities of Zeman Shah, king of Candahar, were likewiſe urgently ſolicited. Even after the ſplendid ſucceſs on the Egyptian coaſt, the earl did not ſuffer the leaſt abatement of the ſpirit of military or naval preparation; and, his repeated offers of negociation being evaded by Tippoo, he gave orders for the march of the troops, and ſent intelligence to the commander of the king's ſhips on the coaſt of Malabar, and to the allies of the company, that he conſidered the Britiſh government in India as being at war with that of Myſore. The ſultan now gave a reluctant aſſent to the admiſſion of an envoy; but this was deemed an artifice for the purpoſe of gaining time, as it was known that he had recently diſpatched ambaſſadors to the executive directory of France, to ſupplicate their aid.

About eighteen thouſand effective men, of whom above twelve thouſand were natives of India, advanced from the coaſt of Coromandel under the command of general Harris; and, being joined by the troops of the nizam, reduced ſome ill-defended forts on the frontiers of Myſore. Tippoo, in the mean time, attacked at Sidaſir a brigade of the army which had been put in motion by the governor of Bombay, and of which lieutenant-general James Stuart had the command. The great ſuperiority of the aſſailants, in point of number, did not enſure to them the victory which they expected to obtain. They were routed on the 6th of March, 1799, with a loſs which very far exceeded that of ſir James, whoſe ſucceſs entitled him to high praiſe.

The ſultan now haſtened to meet the grand army, and encountered the right wing near Malavelli. The engagement, which was not very ſanguinary, ended in the defeat of the Myſorians. When general Harris approached Seringapatam, another conflict favourable to his army occurred. He then commenced the ſiege of that town; and the Bombay force zealouſly promoted the ſucceſs of the enterpriſe. Tippoo had not taken proper meaſures for obſtructing the march of his enemies, or intercepting their ſupplies of proviſion; and, during the ſiege, he did not act in the moſt judicious manner for the defence of the town or the ſupport of his beſt intereſts. The beſiegers profited by his inattention, and carried on their operations with vigor and alacrity. As ſoon as a breach was perceived, arrangements were made for an aſſault. The battalions advanced in the heat of the day, May 4, when the beſieged were leaſt prepared for oppoſition; and, having paſſed the Caveri, approached the rampart. Sergeant Graham led the forlorn hope with an animated countenance; but, while he was fixing the colour-ſtaff on the breach, he was ſhot through the head. The alarm having rouſed the ſultan, he haſtened along the rampart, and found his men purſued by the grenadiers who had ruſhed through the breach. He endeavoured to rally the fugitives; and the intruders were checked for a time; but their impetuoſity ſubdued the ſpirit of reſiſtance. Retiring to the gate of the inner fort, the haraſſed prince received ſeveral wounds; and, in aiming a blow at a ſoldier who was ſeizing his ſword-belt, he was killed by a ball which ſtruck him in the temple. When the oppoſition of the garriſon had ceaſed, the victorious officers eagerly repreſſed the violence of their men. In a town abounding with wealth, deſultory acts of depredation could not be prevented; but the riches of the palace were reſerved for regular diſtribution.

A quadruple diviſion of the conquered country now took place. The territories of the company were conſiderably augmented; the nizam and the Mahrattas obtained additional parts of Tippoo's dominions; and the remaining portion was given to a prince of that family which had loſt its power by Hyder's uſurpation. This extraordinary ſucceſs fixed the Britiſh power in the Eaſt on a firm baſis, and gave it a deciſive ſway over the princes of India. See the article HINDOOSTAN.

Before the report of this rapid conqueſt reached Great Britain, an expedition was planned for the reſcue of the United Provinces from French tyranny. After a long courſe of preparation, a deſcent was made, Auguſt 27, 1799, on the coaſt of North-Holland. A body of ſeven thouſand men, French and Dutch, encountered the Engliſh, who with difficulty gained the advantage. Above one thouſand of the enemy were killed or wounded, and of the Britiſh about 450. It was the intention of ſir Ralph Abercrombie to attack the Helder fort the next morning; but it was evacuated in the night, and he found in it a conſiderable train of artillery. A naval magazine was alſo abandoned; and thirteen ſhips of war, beſides three Indiamen, were taken without reſiſtance. Vice-admiral Mitchell then made judicious arrangements for entering the harbour of the Texel; and the approach of the veſſels which he ſelected for that ſervice aſtoniſhed the Hollanders. Having ſummoned the commander of the Dutch fleet to hoiſt the flag of the prince of Orange, and accept the friendſhip of Great Britain, he received an anſwer from rear admiral Story, promiſing to deliver up his ſquadron, as the men refuſed to fight. The ſhips were twelve in number, and eight of them mounted from fifty-four to ſeventy-four guns.

For ſeveral days the invading army had no other ſhelter than could be obtained by digging trenches in the ſand; but

but they found better quarters in their progreſs. While they waited for the arrival of reinforcements, about twelve thouſand French and Dutch attacked them with vigour, September 10; but ſo ſtrong was the poſt of the Zuyp, and ſo firmly did the Engliſh defend it, that about eight hundred of the aſſailants were killed or wounded, while only two hundred ſuffered on the part of their opponents. The guards diſtinguiſhed themſelves in this engagement, and made great impreſſion on a column of French. The duke of York now landed with three brigades, and a Ruſſian army alſo diſembarked. As the allied army amounted to thirty-five thouſand men, the duke, and general d'Hermann, ventured upon a ſpeedy action. The Ruſſians, by an impetuous onſet, September 19, made great havock, and puſhed forward to Bergen. Abercrombie's column penetrated to Hoorn; and the two other columns were ſucceſsful in their attacks; but the raſh confidence of the Ruſſians expoſed them to ſuch danger, that the retreat of the whole force ſoon became neceſſary. About three thouſand of the enemy are ſaid to have been made priſoners, and two thouſand were killed or wounded; of the Britiſh ſoldiers, above one thouſand were killed, wounded, or captured; and of the Ruſſians about two thouſand.

When the weather permitted, the army moved forward, in four columns, to the battle of Egmont, October 2. The Engliſh and Ruſſians were commanded by generals Abercrombie, d'Eſſen, Dundas, and Pulteney. The hoſtile force conſiſted of twenty-five thouſand men, of which number about three-fifths were French, who were under the orders of general Brune, while Daendels had the command of the Dutch. The main body of the firſt column did not meet with great reſiſtance in the early part of the day; but when ſir Ralph approached Egmont, he was warmly oppoſed by a ſtrong corps of French infantry, who were ſupported by a conſiderable body of cavalry and a train of artillery upon the beach. A part of the ſame column, under colonel Macdonald, had driven the enemy from Campe and the neighbouring ſand hills; and ſome brigades of the ſecond and third diviſions forced Schorel and other poſts. The vicinity of Bergen was a ſcene of briſk conflict. The brigades of major-general Coote and the earl of Chatham charged the enemy in flank and rear, and produced a confuſed retreat; but they could not prevent their adverſaries from re-occupying the village in force, though they defended with effect ſome heights which they had ſeiſed. Colonel Macdonald being cloſely engaged with a reſolute body, lieutenant-general Dundas ſent a corps to aſſiſt that officer, and thus enabled him to proceed to the aid of ſir Ralph, who had been contending for ſome hours with a very ſuperior force. At length the cavalry were baffled in an attack upon the Britiſh artillery, and, being charged with ſpirit by lord Paget, were driven towards Egmont with conſiderable loſs. The evening put an end to the engagement; and the troops reſted upon their arms. At day-break, the retreat of the enemy gave the Engliſh and Ruſſians an opportunity of taking ſeveral poſts; but, though they puſhed forward for that purpoſe, they were precluded by fatigue from effectually haraſſing the republican troops. The killed and wounded of the Britiſh were about 1350 by ſome accounts, and 1550 by others. Of the Ruſſians about 600 ſuffered or were captured. The loſs of the French and Dutch roſe far beyond theſe calculations. The enemy ſeem to have marked out the Engliſh officers, as an unuſual proportion received wounds. The enemy having taken a very ſtrong poſition, and being in expectation of a reinforcement, the duke of York reſolved upon another attack before the erection of new works, and when he had no knowledge of the arrival of freſh troops to oppoſe him. The Ruſſians had a greater concern in this action of October 6, than in the preceding; and they were ſo vigorouſly reſiſted; that ſir Ralph Abercrombie was obliged to advance with a ſtrong body to their relief. The whole hoſtile force then put itſelf in motion, and the action became general along the line from Limmen to the ſea. It terminated to the honour of the invaders, as they were left maſters of the field. The Ruſſians killed were above 380; and 735 were wounded. The Britiſh loſt about 100 in killed; 725 were wounded; and above 600 were miſſing.

A conſiderable body of freſh troops joined the army of general Brune after this action; and he ſtationed his force ſo ſtrongly, as to render a renewal of attack highly dangerous. This conſideration, added to the ruined ſtate of the roads, and the difficulty of procuring ſupplies neceſſary for the accommodation of the ſoldiery, produced in the minds of the chief officers a conviction of the prudence of a retreat. This determination was executed without diſorder, and with ſmall loſs. A convention was adjuſted, October 18, between the commanders of the oppoſite armies, providing for the ſpeedy departure of the Engliſh and Ruſſians, prohibiting the commiſſion of any injury by the retiring hoſt, and requiring the delivery of eight thouſand French and Dutch priſoners of war, who had been taken before the preſent campaign. It was in the power of the invaders to ſecure a retreat to their ſhips by inundating North Holland; but, as this was a meaſure which would have greatly diſtreſſed or ruined the inhabitants, the duke of York abſtained from this inhumanity, by the ſurrender of priſoners without exchange.

Though the French preſerved their influence in Holland unimpaired, their own government now ſuffered a great change. The two councils had lately humbled the directory, and thus adhered to the conſtitution of 1795; but they were expoſed to a violent attack from the ambition of Bonaparte. Returning ſuddenly from Egypt, he ſtrengthened his intereſt among the ſoldiery and the people; and, having procured an appointment to the command of the Pariſian guard, he forcibly diſſolved the two aſſemblies, November 10, 1799, and became in effect ſovereign of France, under the title of *Firſt Conſul*. His popularity, and the terror of his name, ſecured the aſſent of the people to the new conſtitution; and he prepared to impreſs other nations with a ſenſe of his importance and a reſpect for his dignity. To give the greater weight to his new character, he ſuggeſted, by a letter under his own hand, to the king of Great Britain, a pompous propoſition for a general peace; but the offer was rejected, and vigorous preparations were made for the campaign of 1800.

During the winter, the temporary danger of the ſovereign greatly alarmed his loyal ſubjects. Hadfield, who had ſerved his country as a ſoldier, fired a piſtol at the king in one of the theatres; but fortunately no injury reſulted from the daring attempt. As evident proofs of inſanity were adduced, the maniac was acquitted.

The moſt important event which took place in the year 1800, was the union of Great Britain with the kingdom of Ireland. Upon this occaſion the king declared, that he ſhould "ever conſider this great meaſure as the happieſt event of his reign." That it was one of the moſt judicious acts of the government, few will be diſpoſed to deny; and the mode in which it was conducted, without aſperity or rancour, and in a moment ſo critical to the peace and ſafety of Ireland, will ever reflect the higheſt credit on the miniſter, Mr. Pitt, under whoſe auſpices the enactment of union took place, on the 2d of July in England, and the 1ſt of Auguſt in Ireland, ſo nearly at the completion of the eighteenth century.

The new conſul, finding his deſire of being the pacificator of Europe rejected by the king of Great Britain, propoſed to the court of Vienna a renewal of a ſeparate negociation; but the influence of the Britiſh miniſtry, and the ſucceſs of the late campaign, induced the emperor to continue the war. His troops gained ſome advantages in the ſpring, when they attacked the French in the Ligurian territories. After ſeveral engagements, general Melas encountered Maſſena near Voltri; and, having prevailed in a conflict which proved fatal to a vaſt number

of

of men, he confined the enemy within the walls of Genoa. In the blockade of that city a Britiſh ſquadron aſſiſted; and the want of proviſions reduced the defenders to moſt ſevere difficulties. Sickneſs became ſo prevalent, and hunger ſo urgent, that Maſſena was at length obliged to ſue for the indulgence of an unmoleſted retreat.

As it was the earneſt wiſh of Bonaparte to ſtrike a deciſive blow in Italy, he ſent forward a conſiderable army under Berthier, to prepare the way for his own perſonal operations. Penetrating into Piedmont over the mountain of St. Bernard, the French drove their alarmed adverſaries, before them; and, advancing into the Milaneſe, ſpeedily re-took ſome of the chief towns. At Caſteggio, they met with important ſucceſs; but their moſt ſignal triumph was on June 14, at Marengo. Here the vigour of the Auſtrians ſeemed long to promiſe victory to their efforts. They turned the wings of the French, and forced the centre to fall back; and Melas even flattered himſelf with the hope of cutting off the retreat of the diſordered troops. But, when the chief conſul, who was in the heat of action, almoſt deſpaired of ſucceſs, the celebrated Deſaix appeared with a corps de reſerve, and changed the fortune of the day. A new line was formed; the Auſtrians were checked in their career; and, though they ſtill exhibited marks of obſtinate courage, they were at length totally routed. About nine thouſand of their number were killed, wounded, or made priſoners, but not without the loſs of many lives on the part of the conquerors. This defeat ruined the hopes of the emperor. It was followed by a propoſal from the vanquiſhed general for an armiſtice, which he purchaſed by the reſtitution of Genoa, and the ſurrender of the citadels of Milan, Turin, Tortona, and other fortreſſes.

The French alſo acted with ſimilar vigour in Germany. Moreau engaged general Kray at Moſkirch; but a Bavarian force, ſubſidiſed by Great Britain, contributed to prevent the republicans from being completely victorious on this occaſion. Several other obſtinate battles took place, with conſiderable loſs on both ſides; and, after the victory of Oberhauſen, the French took poſſeſſion of Munich, and other Bavarian towns; but their progreſs was arreſted by a truce. The emperor conſented to a negociation, July 28, which produced preliminaries founded on the treaty of Campo Formio.

The hoſtilities of the Engliſh during the year 1800, were chiefly connected with the maritime ſervice. A deſcent being made on the coaſt of Bretagne, the forts of Quiberon were deſtroyed; and other debarkations were injurious to the French. From the Dutch the African iſle of Goree was taken, as was alſo the American iſland of Curaçoa. And after a very long blockade, in which the Portugueſe aſſiſted, the French were compelled to relinquiſh Malta, on September 5, to the great joy and reputation of the Britiſh court. Ferrol was for ſome time threatened by a Britiſh armament; but, though the invaders gained the neighbouring heights by repelling the Spaniards, they had no encouragement to attack the place. Cadiz was likewiſe menaced, and was ſaved by the ſame improbability of ſucceſs, added to the riſque of being infected with a contagious diſeaſe, then prevailing among the garriſon and the inhabitants.

On the cloſe of the campaign of the year 1800, the emperor of Ruſſia withdrew his arms from the confederacy. Not content with this manifeſtation of his deſertion of the common cauſe, he expreſſed ſtrong reſentment againſt England, complaining of her maritime encroachments; and he ſtopped all the Britiſh veſſels in his ports, before the diſpute reſpecting Malta gave him even a pretence for diſpleaſure. He, however, removed the embargo; but again renewed it, on the idle allegation of the detention of Malta, to which he claimed a right, in conſequence of the aſſumed authority of grand maſter of the order of knights of St. John of Jeruſalem. He even ſent the ſeamen into confinement, and haraſſed them with arbitrary rigour. To the Daniſh court, and alſo to that of Sweden, he propoſed a renewal of thoſe engagements of armed neutrality which the empreſs Catharine had framed during the American war; and a convention to that effect was ſigned at Peterſburg, December 16, 1800. Reſenting this ungenerous conduct, the Britiſh court ſubjected Ruſſian, Daniſh, and Swediſh ſhips, to an embargo, January 14, 1801, and prepared for vigorous hoſtilities.

While this ſtorm impended over Great Britain from the north, her Auſtrian ally was perſuaded to renounce the late preliminaries, and again renew the war. But the ſignal defeat of the Auſtrian army at Hohenlinden by the ſkill of Moreau, the ſucceſs of Augereau in Franconia, and the progreſs of the republicans in Italy, induced the emperor to ſue for peace; and, being releaſed from the obligation of treating in concert with Britain, he authoriſed count Cobentzel to ſign a treaty at Luneville. By this treaty, he confirmed the ceſſion of the Belgic provinces to the French: he alſo ceded to them the county of Falkenſtein, the Frichtal, and all the Auſtrian territory on the left bank of the Rhine between Zurzach and Baſle; and engaged to give up the Briſgaw to the duke of Modena. He conſented to the renunciation of Tuſcany by the grand duke, who was to be ſucceeded by the heir of the duchy of Parma, and was to be indemnified by German grants. He ſanctioned the agreement of the deputies of the empire, who had aſſented, in the congreſs at Raſtadt, to the French demand of the permanent poſſeſſion of the countries ſituated on the left bank of the Rhine, from the point where it leaves the Helvetic territory to the ſpot where it enters the Batavian confines. The republic waved all pretenſions to the right bank of that river, and promiſed to reſtore the fortreſſes of Duſſeldorff, Ehrenbreitſtein, Philipſburg, Caſſel, and Old Briſach, on condition of their remaining in the ſame ſtate in which they ſhould be found at the time of their evacuation; and it was alſo agreed, that the former aſſignment of Venetian territories to the emperor ſhould be eſtabliſhed.

In this ſtate of affairs the parliament aſſembled, February 2, 1801. Addreſſing the two houſes, the king obſerved, that, at a criſis ſo important to the intereſts of his people, he derived great ſatisfaction from being enabled, for the firſt time, to avail himſelf of the advice and aſſiſtance of the united parliament. "This memorable era, (he ſaid,) diſtinguiſhed by the accompliſhment of a meaſure calculated to augment and conſolidate the ſtrength and reſources of the empire, and to cement more cloſely the intereſts and affections of my ſubjects, will, I truſt, be equally marked by that vigour, energy, and firmneſs, which the circumſtances of our preſent ſituation peculiarly require."

The moſt remarkable debate in this meeting of the parliament, related to the caſe of the Iriſh catholics, whoſe claims, after the completion of the act of union, formed a particular ſubject of diſcuſſion in the cabinet. Mr. Pitt and lord Grenville repreſented an acquieſcence in the wiſhes of thoſe ſectaries as neceſſary for the perfect conſolidation of the intereſts of the united kingdom, and affirmed, that, as no danger could ariſe from it, policy required the conceſſion. Several of the privy council expreſſed oppoſite ſentiments; and his majeſty took a decided part in the diſpute, alleging that the oath taken by him at his coronation precluded his aſſent to a ſcheme which might, in its conſequences, endanger the religious eſtabliſhment. As this repugnance obſtructed the recommendation of the meaſure to the parliament, and diminiſhed the probability of its ſucceſs, Mr. Pitt declared that he conceived himſelf bound by his duty, his conſcience, and his honour, to reſign that ſituation in which he was not at full liberty to purſue his ideas of equity and public benefit. His reſignation was accepted, as was alſo that of lord Grenville; and earl Spencer, at the ſame time, relinquiſhed all concern in the affairs of the admiralty.

After ſome deliberation, his majeſty ſelected Mr. Addington for the office of his firſt miniſter. That gentle-

man had long been an intimate friend of Mr. Pitt, whoſe influence had placed him in the chair of the houſe of commons, which he filled with high reputation. Lord Hawkeſbury was ſelected for the vacancy occaſioned by the reſignation of lord Grenville; and the earl of St. Vincent was made ſucceſſor to earl Spencer, as firſt lord of the admiralty.

A febrile indiſpoſition with which the king was ſeized, retarded the public buſineſs. It was apprehended that a regency would be neceſſary; but the return of health, after an illneſs of three weeks, enabled his majeſty to renew his attention to affairs of ſtate. On the 17th of March he honoured Mr. Addington with a formal appointment to the two offices which Mr. Pitt had ſo long enjoyed; ſubſtituted lord Hobart and Mr. Charles Yorke in lieu of Mr. Dundas and Mr. Wyndham, and deputed the earl of Hardwicke to Ireland as lord-lieutenant.

The orders which the late miniſtry had iſſued for vigorous operations againſt the Danes and Swedes in the Weſt Indies, were now carried into effect. Lieutenant-general Trigge and rear-admiral Duckworth ſailed from Antigua with a ſmall fleet and about fifteen hundred ſoldiers, and ſteered to the Swediſh iſle of St. Bartholomew. The governor, having no means of effectual defence, acquieſced in the demand of an immediate ſurrender. Leaving a garriſon in the chief town, the aſſociated commanders would have proceeded without delay to the iſle of St. Thomas; but the appearance of a reinforcement from England induced them to extend their views to the reduction of St. Martin, though an attempt upon this iſland was not included in the inſtructions which they had received. One brigade landed in the Dutch quarter, and another in the French territory, March 24, 1801. The former, in approaching the heights near Fort Amſterdam, met with ſome reſiſtance, but prevailed in every ſkirmiſh. The enemy, having attacked one of the poſitions occupied by the Engliſh, a ſpirited conflict enſued, which terminated in the defeat of the enemy; and a capitulation was ſigned the next morning.

The Daniſh iſlands were the next objects of attack. The fleet ſailing to the weſtward, the iſles of St. Thomas and St. John were taken without oppoſition; and St. Croix (or Santa Cruz) was added with facility to the Britiſh conqueſts. Some veſſels were found in the harbours of theſe iſlands; but they were not large or valuable. As it was not ſuppoſed that theſe acquiſitions would be durable, the ſucceſs made little impreſſion on the public: but the expedition tended to prove the determination of the cabinet to maintain the naval authority of Great Britain.

This authority was further eſtabliſhed in a moſt honourable and glorious manner by the Britiſh fleet, which was purſuing its courſe toward the Sound. The commandant of the caſtle of Cronenburg having intimated that he would not ſuffer the Engliſh ſhips to paſs, this anſwer to an application from ſir Hyde Parker was conſidered as a declaration of war, though the admiral aſſured the Dane that he was ready to attend to any conciliatory propoſals. The cannonade began from the fortreſs, but was not very injurious to the fleet, which ſoon reached the iſle of Huene. From this ſtation ſir Hyde reconnoitred the Daniſh line of ſhips, radeaux, pontoons, galleys, fire-ſhips, and gun-boats. The approaches to Copenhagen were fortified with ſkill; batteries of cannon and mortars were erected on every part of the ſhore where they were likely to be efficacious; the Crown iſlands and that of Amak were ſtrengthened by a variety of works; the mouth of the harbour was protected by a chain and by a fort built on piles; and a line of ſhipping added to the natural ſtrength of the place. The admiral, on the 2d of April, having ordered an attack from the ſouthward, lord Nelſon advanced with twelve ſail of the line, four frigates, ſome ſloops, fire-ſhips, and bomb-veſſels; but, from the intricacy of the navigation, two of the largeſt ſhips ran aground, and another was obliged to caſt anchor far from her appointed ſtation. Captain Murray, in the Edgar, led the van with great intrepidity. The Monarque ſuſtained the moſt deſtructive fire; and her commander, captain Moſſe, loſt his life, with above fifty of his men. Captain Riou was alſo killed, while he was attacking the ſhips at the entrance of the harbour. The battle raged for four hours, with great ſlaughter on both ſides. The number of killed, on the part of the Engliſh, exceeded 250; and on the ſide of the Danes, above 500. Almoſt 700 men in the Engliſh ſhips, and about 1500 of the Danes were wounded. Seventeen Daniſh veſſels, floating batteries included, were ſunk, burned, or captured. Immediately after the victory, lord Nelſon threatened to burn all the floating batteries which he had taken, without ſaving the priſoners who were on-board, if the enemy ſhould continue the leaſt firing. This menace produced a ceſſation of hoſtilities: lord Nelſon landed, and conferred with the prince of Denmark; and a convention was ſigned for a regular armiſtice.

The death of the Ruſſian emperor Paul, haſtened this agreement; and, if that event had been known before the ſanguinary conflict occurred, the Danes would probably have ſubmitted without a blow. His violent death ſeemed unlamented; and his ſon Alexander aſcended the throne amidſt the congratulations of his people. An extraordinary change followed this unexpected event. The new emperor diſclaimed the politics of his predeceſſor, and aſſured the Britiſh court of his pacific intentions. The court of Copenhagen relaxed in its zeal for the armed neutrality; that of Stockholm breathed forbearance; and the king of Pruſſia, who had ſeized Hanover, aſſumed a leſs imperious tone. At the requeſt of Alexander, the Britiſh admiral forbore to obſtruct the Ruſſian or Swediſh trade and navigation. Lord St. Helen's was ſent to Peterſburgh to negociate; the reſpective embargoes were taken off; and the ſtorm in the north ſubſided in April, giving place to the milder influence of the month of May.

A convention was now adjuſted, by the interference of Ruſſia, between all the belligerent powers. By the third article of this agreement it was ſtipulated, that effects embarked in neutral veſſels ſhould be free, with the exception of contraband ſtores of war and the property of an enemy; that the latter deſignation ſhould not include the merchandiſe of the produce, growth, or manufacture, of the countries at war, acquired by the ſubjects of the neutral ſtate, and tranſported on their account; that the commodities prohibited ſhould be ſuch only as were declared contraband by the treaty of commerce concluded between Great Britain and Ruſſia in 1797; that a port ſhould be conſidered as under blockade, when the ſhips of a belligerent power ſhould be ſo ſtationed as to render it evidently dangerous to enter; that the neutral veſſels ſhould not be ſtopped except upon ſtrong grounds, and that the proceedings ſhould be uniform, prompt, and legal. The next article provided, that the right of ſearching mercantile veſſels ſailing under convoy of a ſhip of war ſhould only be exerciſed by the ſhips of the government, not by thoſe of private adventurers. Thus the chief points in diſpute were ſettled in favour of thoſe modes which had been long adopted in the commercial intercourſe and connections with Great Britain.

As the north of Europe had thus witneſſed the triumph of the Britiſh navy, ſo did the ſouth feel the effects of its thunder. Rear-admiral ſir James Saumarez was cruiſing near Cadiz, when it was reported to him that three French ſhips of the line and a frigate had been ſeen near Gibraltar. He immediately directed his courſe to the entrance of the ſtrait; and, finding that the ſhips which he wiſhed to engage had anchored in the bay of Algeſiras, he ſent the Venerable man of war to begin the attack. Rear-admiral Linois now drew his ſhips in a cloſer line, and warped them near the batteries which defended the bay; and a briſk fire was opened, on July 6, not only from the ſhips, but alſo from the fortifications, and from a number

of

of gun-boats ſo diſpoſed as to rake the Engliſh ſquadron. Captain Stirling, in the Pompée, made a great impreſſion on the flag-ſhip of Linois, till a change of wind prevented him from acting. As ſoon as the wind favoured, the Hannibal, captain Ferris, puſhed forward in the hope of paſſing between the French ſhips and the batteries; an attempt which, he thought, might lead to a complete triumph. But his ſhip happened to take the ground under one of the batteries; and, as no efforts could extricate her, he was obliged to give her up, after a conſiderable loſs of men and the deſtruction of a great number of his adverſaries. A breeze having enabled two other ſhips to approach the enemy, they kept up for a time a heavy fire, which, if the wind had not declined, would have enforced the ſurrender of the oppoſing veſſels. The impracticability of a cloſe action at length induced ſir James to withdraw his force, when above 360 of his men had been killed or wounded. This diſappointment ſerved only to ſtimulate the eagerneſs of the Britiſh ſeamen for another conteſt. The ſhips were repaired with great expedition; and, when the French, joined by a Spaniſh ſquadron, were ſailing toward Cadiz, the rear of the united fleet was attacked, on July 12, by the Superbe. This veſſel having fired between the Spaniſh admiral's ſhip and another of 112 guns, and then retiring, a mutual error (amidſt the darkneſs of the night) occaſioned a conflict between thoſe two enemy's ſhips. One of them ſuddenly took fire; the flames rapidly extended to the other; and both blew up, with the loſs of about two thouſand men. This melancholy accident diſcouraged Linois and his aſſociates, and tended to accelerate their retreat. The San Antonio, of ſeventy-four guns, was taken; but the Formidable baffled a ſevere attack from captain Hood, whoſe ſhip ſtruck upon a rock, and was with difficulty towed off in a diſabled ſtate. The enemy reached Cadiz without further moleſtation; and admiral Saumarez ſailed with his prize to Gibraltar.

But while theſe partial conflicts were going on in the vicinity of the Britiſh territories in Europe, the deciſive battle was fought before Alexandria in Egypt, which gave peace and glory to England; (ſee the article EGYPT, p. 336;) and when this ſucceſs was announced in England, the general joy was accelerated by a two-fold cauſe. M. Otto had been for ſome time negociating with lord Hawkeſbury, on the ſubject of a general peace, the preliminary articles of which were ſigned October 1, 1801. It was ſtipulated, that the king of Great Britain ſhould reſtore all the poſſeſſions and colonies occupied or conquered by his forces in the courſe of the war, except the iſland of Trinidad, and that part of Ceylon which lately belonged to the Dutch; that, in the port of the Cape of Good Hope, each of the contracting parties ſhould enjoy the ſame advantages; that the territories of the Ottoman emperor, including Egypt, ſhould be maintained entire, as they were before the war; that the French ſhould recogniſe the republic of the Seven United Iſlands: theſe were Corfu, Cephalonia, Zante, &c. which, having been taken by the Ruſſians and Turks, had been formed into a republic under their protection. That Malta ſhould be again poſſeſſed by the knights of St. John of Jeruſalem; that the kingdom of Naples and the Roman ſtate ſhould be evacuated by the French troops; and that the queen of Portugal ſhould not loſe any part of her dominions, but remain as before the war. For a completion of theſe articles, it was agreed that Engliſh and French plenipotentiaries ſhould ſpeedily repair to Amiens, and treat in concert with the reſpective allies of the two powers.

While the definitive treaty was yet unadjuſted, a great force was deemed neceſſary for the national defence, as doubts were ſtill entertained of the pacific inclinations of the firſt conſul of France. From the eagerneſs of the public for a general peace, the interval of negociation ſeemed a tedious delay; but the anxiety of ſuſpenſe was at length removed. The treaty was finally ſigned at Amiens by the marquis Cornwallis and Joſeph Bonaparte, March 27, 1802; differing from the preliminaries only in the following points: A part of Portugueſe Guiana was given up to the French by a new adjuſtment of boundaries. With regard to Malta, it was ſtipulated that no French or Engliſh tongue, or claſs of knights, ſhould be allowed; that one-half of the ſoldiers in garriſon ſhould be natives, and that the reſt ſhould be furniſhed for a time by the king of Naples; that the independence of the iſland under the ſway of the knights ſhould be guaranteed by France, Great Britain, Auſtria, Spain, Ruſſia, and Pruſſia; and that its ports ſhould be free to all nations. It was agreed, that the prince of Orange ſhould receive compenſation for his loſs of property and of power. Perſons who might hereafter be accuſed of murder, forgery, and fraudulent bankruptcy, were to be ſurrendered to the demands of each of the reſpective powers.

It was never expected that this peace would be of permanent duration; the unſettled ſtate of the government of France, and the partial and intereſted views of the firſt conſul, plainly indicated that the preſent pacification was intended only as a grand pauſe—a ceſſation from hoſtilities merely to take breath—while plans of greater aggrandiſement and ambition were fabricating, and to ariſe out of the ſcourges of a new war. This diſpoſition too ſoon manifeſted itſelf in the imperious manners and arbitrary conduct of Bonaparte, who affected to treat with contempt and deriſion, at Paris, ſeveral of the ambaſſadors from thoſe powers who had oppoſed France in her late revolutionary ſyſtem. The moſt marked indignities were caſt upon lord Whitworth, ambaſſador from the court of London, boldly charging his ſovereign with an infraction of the treaty of peace, by keeping poſſeſſion of the iſland of Malta. Lord Whitworth, in his turn, demanded an explanation of the ſecret views of France in her extraordinary armaments, and in her political connections with thoſe powers inimical to Great Britain; and in failure of a ſatisfactory anſwer, his lordſhip gave notice of his determination to quit Paris, as the prelude to freſh hoſtilities. To this requiſition the firſt conſul loudly and haughtily replied, in the face of his whole levee, "That France was prepared, and the battle ſhould be fought on Engliſh ground." Lord Whitworth immediately quitted Paris, and a new war commenced between France and England, May 12, 1803, juſt thirteen months and fifteen days after ſigning the definitive articles of the peace of Amiens.

The only meaſure hitherto adopted on the part of France, has been the old and ſtale threat of an invaſion of England; while, on the other hand, the ports of France have been ſo cloſely blockaded by the fleets and ſquadrons of Great Britain, that ſcarcely a French veſſel has dared to put to ſea but by ſtealth; the whole naval power of France has been thus confined to their own harbours, and their commerce virtually annihilated. But the very unhandſome detention of a number of Engliſh gentlemen who were ſpending their money in France, was a ſpecies of unmanly and impotent revenge, totally unworthy of the head of a great nation.

Though from the cauſe above-mentioned, no general action at ſea has hitherto taken place, nor can perhaps be expected, yet the Engliſh cruizers have been ſo ſucceſsful in the only warfare that has been carried on, that not leſs than a hundred and five prizes were carried into one ſingle port (Plymouth), in the ſpace of three weeks after the commencement of hoſtilities. No time was loſt in ſending notice of the event to the Britiſh fleets on the Eaſt and Weſt India ſtations; and the iſlands which had been ceded to France at the peace, with ſeveral others, were again quickly in our poſſeſſion. St. Lucia was taken by the forces under lieutenant-general Grinfield and commodore Hood, on the 22d of June, 1803; Tobago on the 1ſt of July; Demarara and Eſſequibo on the 19th of September; and Berbice on the 25th; the iſlands of St. Pierre and Miquelon were taken by captain Malbon on the 30th of June. In the month of May, 1804, we captured

tured the ſettlement of Surinam, in Dutch Guiana. The enterprize was under the command of major-general ſir Charles Green, aſſiſted by commodore Hood, who ſailed for this purpoſe from Barbadoes on the 6th of April, and reached the mouth of the Surinam river on the 25th of the ſame month. The number of troops amounted to about fifteen hundred, and the total of the enemy's force averaged a number conſiderably ſuperior. The governor refuſed at firſt to capitulate; but, from the activity of the Britiſh troops, he at laſt found himſelf compelled to ſubmit. The conteſt, in the interim, was by no means bloodleſs. It commenced on the 29th of April, and conſiſted of various ſkirmiſhes, which continued till the 4th of May, on which day the enemy diſpatched a flag of truce with propoſals to ſurrender. The terms were honourable to both ſides. The priſoners captured, including ſeamen, excluſive of the ſtaff and departments, amounted to 2100; the ſtores conſiderable and valuable. In November, 1803, the iſland of St. Domingo became an independent black republic: the ſhips and veſſels, commanded by the French general Rochambeau, were taken poſſeſſion of by the Britiſh admiral Duckworth; and Cape Town and the forts were delivered up to the black general Deſſalines; and the place is now reſtored to its ancient name of Hayti. On the other hand, the French general Berthier ſeized upon the electorate of Hanover, on the 5th of June, and and laid it under heavy contributions.

The renewal of the war occaſioned Mr. Addington, in the ſummer of 1803, to revive the income-tax, but under a different form, and at a lower rate, than it had been laid during Mr. Pitt's firſt adminiſtration. The next important meaſure was the bill for the general defence of the nation, the intent of which was to embody the entire effective ſtrength of the country; but the laudable ſpirit of the nation rendered it unneceſſary to enforce the act; for a body of men fully adequate to every purpoſe of defence ſpontaneouſly armed and clothed themſelves at their own expence, and thus nobly contributed *once more* to the ſafety of their country.

The rebellion again broke out in Ireland in July; and might have been attended with very fatal conſequences; but that by ſome fortunate accident the riſing was premature, and the rebels did not act in concert. Nevertheleſs, a very worthy nobleman, lord Kilwarden, was cruelly murdered; but the rebellion was ſoon quelled, and the diligence of the government *afterwards* brought moſt of the ringleaders to public juſtice.

A Mahratta war broke out in India, in September, 1803; but the rapid ſucceſſes of generals Welleſley and Lake, brought about a peace in the month of December of the ſame year. For the cauſes and progreſs of that war, ſee HINDOOSTAN.

At a moment when both king and people appeared well ſatisfied with the perſons who were conducting the affairs of the government; at a moment when the prime miniſter, Mr. Addington, ſeemed to poſſeſs the confidence and good-will of the country; a party, or a co-operation of diſcordant parties, ſuddenly appeared, *in the parliament only*, and determined to impede the adminiſtration of affairs, by enforcing a change in the miniſtry. His majeſty at length conſented to a change; Mr. Pitt became prime miniſter for a ſecond time on the 12th of May, 1804, and Mr. Addington retired, with the greateſt honour to himſelf, untitled, and unpenſioned.

The laſt important meaſure we have to notice in the politics of Europe, is the aſſumption of the title of Emperor by Napoleon Bonaparte, firſt conſul of France. This new dignity was broached in April, and actually took place on the 28th of May, 1804. The title and power is decreed to be inherited for ever by Bonaparte's own male iſſue; or he may adopt the children or grand-children of his brothers, provided they have attained the age of eighteen years complete, and he himſelf have no children. In default of a natural and legitimate heir of the preſent emperor, or of an adopted heir, the empire will be transferred to Joſeph Bonaparte, and his deſcendants; and in default of Joſeph Bonaparte and his deſcendants, to Louis Bonaparte and his deſcendants; in caſe of failure of the heirs of Joſeph and Louis Bonaparte, the ſenate is to appoint an emperor. The members of the imperial family, in the order of inheritance, are to bear the title of French princes. The eldeſt ſon of the emperor is to bear the title of *imperial prince*. The ſalic law is revived, and females are excluded from inheriting the crown, or from being regent in the caſe of the minority of an emperor.

To many thinking people this meaſure will appear a change which adds to the odium of his government, without ſtrenthening the reputation of it; ſince republicans have now to chooſe between the old hereditary ſucceſſion and that of the new. Thus ended the republican form of government in France, after a duration of eleven years and a half. How this bold uſurpation of the rightful inheritance of the unfortunate royal family of France, will be received by the other conſiderable powers of the civilized world—how it may affect the conduct of the war, or accelerate the return of peace; remain to be developed from the boſom of time; and will be diſcuſſed under the article FRANCE, in our ſeventh volume, to which we ſhall beg to refer the reader; and alſo to the article GREAT BRITAIN.

ANTIQUITIES, CURIOSITIES, AND HISTORICAL EPOCHS.

To trace back the antiquities of England, or to fix the era at which our reſearches ought to begin, is a taſk of no ſmall labour and difficulty. That this beautiful iſland was inhabited many ages before it was noticed by Julius Cæſar, and had been conſequently the ſcene of many wars, revolutions, and other important events, there can be no reaſonable doubt; although the antiquarian, in ſuch remote enquiries, is often bewildered and miſled by the fabulous and imperfect accounts of thoſe dark ages.

The ancient monuments which are found in England, may be claſſed in ſix diviſions. 1. Thoſe belonging to the primitive Celtic inhabitants. 2. Thoſe of the Belgic colonies, which followed. 3. Thoſe belonging to the Romans. 4. Thoſe erected by the Saxons. 5. Relics of the Daniſh ſovereignty. 6. Monuments of ſtructures of Norman original. Few of theſe remains, it muſt be confeſſed, throw much light upon hiſtory; but many of them, being intereſting and curious in themſelves, deſerve the attention of the Engliſh traveller. Among the firſt and ſecond claſſes we recognize the curious ſtructure of Stone-henge, and all the other circular temples, rocking-ſtones, barrows, cairns, cromlechs, &c. uſually, and perhaps very erroneouſly, attributed to the Druids. See the article DRUID, p. 88, of this volume.

The Belgic relics were followed by thoſe of the Romans, which are ſtill numerous in different parts of England. Amphitheatres are ſaid to be ſtill diſcernible at Silcheſter, in Hampſhire, and ſome other places. The Roman caſtle at Richborough, the ancient Rutupiæ in Kent, preſents conſiderable remains of a maſſy wall, cemented with ſurpriſing firmneſs. Theſe Roman ruins are commonly compoſed of ſtone or flint, with ſtrata of flat bricks at conſiderable intervals. The moſaic pavements, hypocauſts, &c. are generally the remains of the villas of opulent Roman families, ſcattered over the country. The greateſt number of Roman inſcriptions, altars, &c. has been found in the north, along the great frontier wall, which extended from the weſtern ſea, to the eſtuary of Tyne. This vaſt wall is juſtly eſteemed the moſt important remain of Roman antiquity in England, as that of Antoninus is in Scotland. The extent of the former was about ſeventy miles; of the latter about thirty-ſeven, as deſcribed under the article ANTONINUS, vol. i. p. 781. Numerous are the more minute relics of the Roman power in England, as coins, gems, weapons, ornaments, &c.

One of the grand cauſes of the civilization introduced

by that people into the conquered ſtates, was the highways, which form, indeed, the firſt germ of national induſtry, and without which neither commerce nor ſociety could ever make any conſiderable progreſs. Conſcious of this truth, the Romans ſeem to have lent particular attention to the conſtruction of roads in the diſtant provinces; and thoſe of England, which may ſtill be traced in various ramifications, preſent a laſting monument of the juſtice of their conceptions, the extent of their views, and the utility of their power. A grand trunk, as it may be called, paſſed from the ſouth to the north, and another to the weſt, with branches in almoſt every direction that general convenience and expedition could require. What is called the Watling-ſtreet, led from Richborough, in Kent, the ancient Rutupiæ, north-weſt through London to Cheſter. The Ermin-ſtreet paſſed from London to Lincoln, thence to Carliſle, and into Scotland, the name being ſuppoſed to be corrupted from *Herman*, which means warrior, as the chief wars lay in the north. The Foſſeway is ſuppoſed to have led from Bath and the weſtern regions, north-eaſt, till it joined the Ermin-ſtreet. The laſt celebrated road was the Ikenild, or Ikencld, ſuppoſed to have extended from near Norwich, ſouth-weſt, into Hampſhire and Dorſetſhire. Of the original Britiſh towns we have no certain account; but thoſe of the Romans are well authenticated. The termination *cheſter*, which is common to ſo many towns in England, is thought to be derived from the Latin *caſtra*, they having been places of Roman encampments. LONDINUM, London, was early remarkable for the great reſort of merchants. *Camalodunum*, Malden, or according to others Colcheſter, was the firſt Roman colony in Britain. The port moſt frequented under the emperors, was, *Rutupiæ*, Richborough, in Kent; the *Portus Dubris*, or Dover, was afterwards more famous: and *Lemanis*, Lime, near which Cæſar is ſuppoſed to have firſt landed. Other remarkable places were, *Durovernum*, Canterbury; *Durobrivis*, Rocheſter; *Venta Belgarum*, Wincheſter; *Durnium* or *Durnovaria*, Dorcheſter; *Iſca*, Exeter; *Verulamiam*, Verulam, near St. Alban's; *Aquæ Solis* or *Calidæ*, Bath; *Clanum*, Glouceſter; *Deva*, Cheſter, on the river Dee, where the ancient walls and fortifications ſtill remain; *Lindum Colonia*, Lincoln; *Eboracum*, York; *Luguvallum*, Carliſle; *Alatra caſtra*, ſuppoſed to be Edinburgh, called anciently *Edenodunum*, from its Celtic appellation, *Dune Aidan*, the eminence or citadel of Aidan, its proprietor; *burg*, is Saxon, anſwering to *dune* in the Celtic; or rather, according to others, from *Eden*, a Northumbrian king, who either built or poſſeſſed it. See EDINBURGH, in this volume.

The Saxon antiquities in England are chiefly edifices, ſacred or ſecular; many churches remain which were altogether, or for the moſt part, conſtructed in the Saxon period; and ſome are extant of the tenth, or perhaps the ninth, century. The vaults erected by Grimbald, at Oxford, in the reign of Alfred, are juſtly eſteemed curious relics of Saxon architecture. One of the rudeſt ſpecimens of their ancient caſtles, is Coningſburg-caſtle in Yorkſhire; but, as that region was ſubject to the Danes till the middle of the tenth century, it may perhaps be Daniſh. Among the ſmaller remains of Saxon art, may be mentioned the ſhrines for preſerving relics, which ſome ſuppoſe to preſent the diminutive rudiments of what is ſtyled the Gothic architecture; and the illuminated manuſcripts which often afford curious memorials of the ſtate of manners and knowledge.

The Daniſh power in England, though of conſiderable duration in the north, was in the ſouth brief and tranſitory. The camps or fortifications of that nation were circular, like thoſe of the Belgæ and Saxons, while thoſe of Roman armies are diſtinguiſhed by the ſquare form: and it is believed that the only diſtinct relics of the Danes, are ſome caſtles to the north of the Humber, and a few ſtones with Runic inſcriptions.

The monuments ſtyled Norman, rather to diſtinguiſh their epoch than from any information that Norman architects were employed, are reputed to commence after the conqueſt, and to extend to the fourteenth century; when what is called the rich Gothic ornamented ſtyle began to appear, which, in the ſixteenth century, was ſupplanted by the mixed; and this in its turn yielded to the Grecian. See the article ARCHITECTURE, vol. ii. p. 78–94.

Ancient authors affirm, that king Alfred inſtituted the firſt diviſion of England into ſhires, ſo denominated from a Saxon word, ſignifying parts cut off, or diviſions. They are alſo denominated counties, as having been each governed by a diſtinct *ealdorman*, correſponding with the Latin word *comes*, or count; and ſometimes tranſlated *conſul*, and ſometimes *comes*, by thoſe Anglo-Saxon authors who wrote in Latin. After the Daniſh conqueſt, this officer was known by another appellation, that of *earl*, from the Daniſh *iarl*; which, like the word *baron*, in its original acceptation, implied ſimply, but by way of great eminence, a man. About the eleventh century theſe titles became hereditary dignities; and the government of the ſhire devolved upon the earl's deputy, the *vice-comes*, *ſhire-reeve*, ſheriff, or manager of the ſhire. A remarkable ſubdiviſion prevails in the extenſive county of York, which was divided into three parts, implied in the Saxon word *trythings*, now corruptly called *ridings*. It is alſo generally believed that Alfred was the author of the ſubdiviſions of counties, called hundreds and tythings, now ſeldom mentioned except in legal proceedings, and in topographical deſcriptions.—For the names of the counties, and their particular privileges, ſee the article COUNTY, vol. v. p. 289–290. It is probable that the *hundred*, originally contained one hundred farms; while the *tything* was reſtricted to ten. Such are the chief features of the Saxon diviſions of England. The capital of the ſeveral heptarchic kingdoms varied at the will of the ſovereign. London, which belonged to the Eaſt Saxons, maintained in ſome degree its Roman fame and eminence; but on the termination of the heptarchy, Wincheſter was regarded as the capital of England.

It muſt not however be forgotten, that the kingdom of Northumbria, compriſing the regions north of the Humber, exiſted till the year 950, under its peculiar ſovereigns, the laſt of whom was Eric: and that even Domeſday-book, which was compiled in the time of William the Conqueror, excludes the three counties of modern Northumberland, Cumberland, and Weſtmoreland, then regarded as part of Scotland. Durham, the patrimony of St. Cuthbert, is alſo omitted; and Lancaſhire is arranged under the diviſions of Yorkſhire and Cheſhire. The kingdom of Bernicia at one period extended to the Frith of Forth; but in the latter Saxon times the boundaries of England on the north fell conſiderably ſhort of their preſent extent. On the weſt, Offa king of Mercia reſtricted the Welſh by an extenſive barrier, the remains of which are ſtill called Offa's dyke. It extended from the river Wye, along the counties of Hereford and Radnor into that of Montgomery, where it enters North Wales. It afterwards paſſes by Chirk-caſtle to the river Dee, and ends in the pariſh of Mold.

Few alterations of any conſequence appear to have been made in the Norman period. The northern limits were however extended to their preſent circuit. Cumberland and Weſtmoreland were wreſted from the Scots, and the provinces north of the Humber were completely incorporated. On the weſt, Henry I. about the year 1120, having conquered a part of Wales, invited and eſtabliſhed a Flemiſh colony in Pembrokeſhire, and one or two others of the moſt ſouthern counties, which afterwards became remarkable for induſtry; a ſingular fact, and for that period a remarkable exertion of political wiſdom. The ſubſequent conqueſt of Wales by Edward I. and its gradual aſſimilation and aſſociation with England, have been already ſtated.

The population of England by the Celts, may be regarded as its firſt hiſtorical epoch. The ſecond is formed

by the Belgic colonies; who, perhaps about three centuries before the Chriſtian era, ſeized the ſouthern and eaſtern ſhores, and advancing by degrees reſtricted the Celts to the weſt. The Belgic colonization of England is important in many points of view, as eſtabliſhing the primitive germ of the preſent Engliſh nation, and as introducing agriculture, which was not practiſed by the hunting and paſtoral tribes of the Celts: nor is it improbable that ſome of the fertile diſtricts of England have known cultivation for the ſpace of two thouſand years. The third hiſtorical epoch is the ſubjugation of England by Julius Cæſar.

After a duration of four centuries, the Roman domination yielded to that of the Saxons and Angles, nations congenerous with the Belgæ. This revolution has indelibly impreſſed the name, character, language, laws, manners, and cuſtoms, of the people; and forms the fourth hiſtorical epoch. The fifth commences with the ſovereignty of the Danes, in the year 1016.

On the death of Edward the Confeſſor, what is called the epoch of the conqueſt of England, took place in 1066. As the Normans had been ſettled in the north of France for a long time, they introduced the French language among people of rank, and even into legal procedure; a ſervile badge, not even yet completely eradicated. The great charter granted by king John at Runnymede, is deſervedly eſteemed a memorable epoch of Engliſh freedom. And the civil wars between the houſes of York and Lancaſter, may be regarded as the eighth remarkable epoch. Though deſtructive of literature and the arts, they proved the bane of a ferocious ariſtocracy; and eſtabliſhed by degrees the third balance of the Britiſh conſtitution, i. e. the houſe of commons.

The reformation, by delivering the nation from the heavy yoke of ſuperſtition, increaſed the national energies, and imparted freedom of thought, and a ſpirit of independence, to the individual character; which forms the ninth remarkable epoch. The civil wars under Charles I. form the tenth. The revolution under William III. and the laws enacted upon that occaſion, by the unchangeable eſtabliſhment of the proteſtant religion, create the eleventh epocha, which marks the acceſſion of the houſe of Hanover to the throne of Great Britain.

GOVERNMENT, CONSTITUTION, LAWS, AND RELIGION.

In almoſt all the ſtates of the world, the will of the prince holds the place of law; but it is the ſingular happineſs of the united kingdom of Great Britain, that the legiſlative power is veſted *ſolely* in the parliament; the conſtituent parts of which are the king, the houſe of lords, and the houſe of commons. The king of Great-Britain, though only one branch of the legiſlature, is nevertheleſs one of the greateſt monarchs reigning over a free people. His perſon is ſacred in the eye of the law, which makes it high treaſon ſo much as to imagine or intend his death; neither can he, in himſelf, be deemed guilty of any crime, the law taking no cognizance of his actions, but only in the perſons of his miniſters, if they infringe the laws of the land. As to his power, it is very great, though he has no right to extend his prerogative beyond the boundaries preſcribed by the conſtitution; he can of himſelf make no laws, nor raiſe taxes, nor act in oppoſition to any of the laws; but he can make war or peace; ſend and receive ambaſſadors; make treaties of league and commerce; levy armies, and fit out fleets, for the defence of his kingdom, the annoyance of his enemies, or the ſuppreſſion of rebellions; grant commiſſions to his officers both by ſea and land, or revoke them at pleaſure; diſpoſe of all magazines, caſtles, &c. ſummon the parliament to meet, and, when met, adjourn, prorogue, or diſſolve it, at pleaſure; refuſe his aſſent to any bill, though it had paſſed both houſes; which, conſequently, by ſuch a refuſal, has no more force than if it had never been moved; but this is a prerogative that the kings of England have very ſeldom ventured to exerciſe. He poſſeſſes the right of chooſing his own council; of nominating all the great officers of ſtate, of the houſehold, and the church; and, in fine, is the fountain of honour, from whence all degrees of nobility and knighthood are derived. With all theſe prerogatives, as extenſive and numerous as ever were claimed by the moſt abſolute monarch, yet, ſince only a third branch of the legiſlative authority exiſts in the royal perſon, it is impoſſible for him to exerciſe an arbitrary will—he has indeed the prerogative of commanding armies and equipping fleets; but without the concurrence of his parliament he cannot maintain them. He can beſtow places and employments; but without his parliament he cannot pay the ſalaries attendant on them. He can declare war; but without his parliament it is impoſſible for him to carry it on. In a word, the royal prerogative, deſtitute of the power of impoſing taxes, and with only a ſpecific revenue reſulting from the people, is like a vaſt body, which cannot of itſelf accompliſh its motions; or, it is like a ſhip completely equipped, but from which the parliament can at pleaſure draw off the water, and leave it aground—or ſet it afloat again, by granting the ſupplies.

The parliament is aſſembled by the king's writs, and its ſittings muſt not be intermitted above three years. When the three branches are convened, they form the great corporation or body politic of the kingdom, of which the king is ſaid to be *caput, principium, et finis*. For upon their coming together the king meets them, either in perſon, or by repreſentation; without which there can be no beginning of a parliament; and he alſo has alone the power of diſſolving them.

It is highly neceſſary, for preſerving the balance of the conſtitution, that the executive power ſhould be a branch, though not the whole, of the legiſlature. The crown cannot begin of itſelf any alterations in the preſent eſtabliſhed law; but it may approve or diſapprove of the alteration ſuggeſted and conſented to by the two houſes. The legiſlative therefore cannot abridge the executive power of any rights which it now has by law, without its own conſent: ſince the law muſt perpetually ſtand as it now does, unleſs all the powers will agree to alter it. And here indeed, conſiſts the true excellence of the Engliſh conſtitution, that all the parts of the government form a mutual check upon each other. In the legiſlature, the people are a check upon the nobility, and the nobility a check upon the people; by the mutual privilege of rejecting what the other has reſolved: while the king is a check upon both, which preſerves the executive power from encroachments.

The lords ſpiritual conſiſt of two archbiſhops and twenty-four biſhops. The lords temporal conſiſt of all the peers of the realm, the biſhops not being in ſtrictneſs held to be ſuch, but merely lords of parliament. Some of the peers ſit by deſcent, as do all ancient peers; ſome by creation, as do all the new-made ones: others, ſince the union with Scotland and Ireland, by election. The number of Engliſh peers is indefinite, and may be increaſed at will by the power of the crown. A body of nobility is more peculiarly neceſſary in our mixed and compound conſtitution, in order to ſupport the rights of both the crown and the people; by forming a barrier to withſtand the encroachments of both. It creates and preſerves that gradual ſcale of dignity, which proceeds from the peaſant to the prince; riſing like a pyramid from a broad foundation, and diminiſhing to a point as it aſcends. The nobility therefore are the pillars, which are reared from among the people, more immediately to ſupport the throne; and, if that falls, they muſt alſo be buried under its ruins. Accordingly, when in the ſeventeenth century the commons, under Cromwell, had determined to extirpate monarchy, they alſo voted the houſe of lords to be uſeleſs and dangerous.

The commons conſiſt of all ſuch men, of any property in the kingdom, as have not ſeats in the houſe of lords; every

every one of which has a voice in parliament, either perſonally, or by his repreſentatives. In a free ſtate, every man who is ſuppoſed a free agent, ought to be, in ſome meaſure, his own governor; and therefore a branch at leaſt of the legiſlative power ſhould reſide in the whole body of the people. In ſo large a ſtate as that of Great Britain, it is very wiſely contrived, that the people ſhould do that by their repreſentatives which it is impracticable to perform in perſon; repreſentatives choſen by a number of minute and ſeparate diſtricts, wherein all the votes are, or eaſily may be, diſtinguiſhed. The counties are therefore repreſented by knights, elected by the proprietors of lands; the cities and boroughs are repreſented by citizens and burgeſſes, choſen by the mercantile part, or ſuppoſed trading intereſt, of the nation. The number of Engliſh repreſentatives is 513; of Scots, 45; and of Iriſh, 100; in all 658. And every member, though choſen by one particular diſtrict, when elected and returned, ſerves for the whole realm. For the end of his coming thither is not particular, but general; not merely to ſerve his conſtituents, but alſo the commonwealth, and to adviſe his majeſty, as appears from the writ of ſummons. Theſe are the conſtituent parts of a parliament, of which each is ſo neceſſary, that the conſent of all three is required to make any new law that ſhould bind the ſubject; and theſe conſtituent parts form what has been long called the GLORIOUS CONSTITUTION of Great Britain; the ſource and guardian of our liberties and properties, the ſtrong cement which binds the foundation and ſuperſtructure of our government, and the wiſely-concerted balance, maintaining an equipoiſe, that no one part of the three eſtates can overpower or diſtreſs either of the other two.

Originally both the nobles and the commons met in one houſe; and as the greateſt national events often depend on chance, it is not impoſſible that the mere inconvenience of not finding halls large enough for the whole parliament, might have occaſioned the diviſion into two houſes, unknown in any other country, and which in fact may be regarded as the firſt foundation of Engliſh liberty. The houſe of peers may be ſaid to have exiſted from the earlieſt period of our hiſtory. Concerning the commons, authors are diſſentient, ſome aſſerting that they formed a part of the *Wettena-ge-Mot*, or aſſembly of ſages; and it is not improbable that commoners of diſtinguiſhed ability might have been admitted to that great council, which conſiſted principally of military chiefs. But it ſeems improbable that delegates from towns ſhould have been then known, as the idea ſeems too complex for a rude people; nor have we any traces of it in our ancient records. However this be, the preſent conſtitution of the parliament of England, may certainly be traced to near the middle of the thirteenth century; but it remains unknown at what preciſe time happened the important ſeparation of the commons from the peers.

The peers of England only require the full age of twenty-one years, to become hereditary ſenators in their ſeveral degrees of duke, marquis, earl, viſcount, and baron, formerly created by inveſtiture, or ſymbolic forms, but latterly by patent. Every peer may appoint a proxy to vote for him in the ſenate, a privilege unknown to the commons. In the houſe of peers is placed the royal throne; but the monarch never attends, except at the meeting or prorogation of parliament, when he proceeds to the houſe in great ſtate; the attendance of the commons is commanded, who ſtand below the bar, and the king pronounces his ſpeech, uſually the compoſition of the miniſter. The arrangement of the houſe of peers is well conceived, and produces a grand effect. The wool-ſacks upon which the chancellor, and the judges when called for their advice, are ſeated, conſtitute a remarkable feature, ſymbolic of the ſtaple commodity of England. The appearance is yet more magnificent, when the peers ſit as judges in Weſtminſter-hall; the greatneſs of the perſons, and the ſolemnity of the occaſions, exciting impreſſions of ſingular national ſublimity.

The houſe of commons conſiſts alone of the repreſentatives of the people. Notwithſtanding any place of dignity or truſt allotted to particular members by the king, ſtill they have no power to ſit, unleſs deputed by the electors, their conſtituents: and with a view to keep this franchiſe for ever inviolate, the wiſdom of our anceſtors laid it down as a fundamental law, that every member of the houſe of commons, accepting a place of truſt or profit under the king or the government, whereby his judgment or conduct might be liable to bias, ſhould to all intents and purpoſes vacate his ſeat in parliament, nor be ſuffered to ſit again, unleſs afterwards re-choſen by his conſtituents. To reſtrict the tumult of popular election, it was enacted by Henry VI. that none ſhould vote for a knight of the ſhire, except freeholders worth forty ſhillings a-year, which at the preſent value of money may be computed at twenty or thirty pounds. It is ſingular that copyholders were excluded. The elections for the cities and boroughs, are regulated by their charters and cuſtoms. The commons form the grand inqueſt of the realm, and may impeach or accuſe the greateſt peers; but their chief privilege, and upon which their whole power depends, is the levying of money, in which they are deſervedly ſo jealous, that they will not permit the ſmalleſt alteration in a money-bill. This amounts to an almoſt abſolute *veto* on any public meaſure, and eſpecially on war. A ſpeaker, or preſident, is choſen at the meeting of every new parliament; an office which requires a competent knowledge of eſtabliſhed forms and ancient uſages of the houſe. Acts of parliament, which conſtitute the ſtatute law of the kingdom, may originate in either houſe; but they commonly make their firſt appearance in the houſe of commons.

To aſſiſt the king in the more critical and important tranſactions of the ſtate, a privy council is appointed. Under whatever form of monarchy, privy councils are found to be coeval with the ſtate. It is impoſſible for one man, however tranſcendent his abilities, to manage alone the multifarious buſineſs of the government. The members are choſen by the king; and on changes of adminiſtration are ſeldom eraſed, though entirely at the pleaſure of the king. A privy council is ſeldom or never held without the preſence of at leaſt one of the ſecretaries of ſtate; who, till the reign of Elizabeth, uſed to ſtand by the royal chair, but have ſince been allowed to ſit at the board.

The judicature of England is worthy of the higheſt applauſe, with regard to preciſion and purity. It is, indeed, to be regretted, that the vaſt number and confuſion of the ſtatutes, render the ſtudy of the laws peculiarly difficult, and that the number of retainers on the courts of juſtice, ſwells the expences of a ſuit to an enormous ſum. But hardly can a country be named on the face of the globe, in which juſtice, civil or criminal, is adminiſtered with more integrity: bribes, ſo frequent in other countries, are totally unknown; and the ſaving of this expence ought to be candidly poiſed againſt other legal diſburſements. The trial by jury is the moſt glorious feature of Engliſh juriſprudence, handed down from the Saxon times, and is juſtly regarded as the ſafeguard of the lives, liberties, and properties, of the nation. Its excellence has been reſpected by the Daniſh and Norman conquerors; and, it is hoped, will be venerated to the lateſt poſterity.

The laws of England in general, form a noble code for the preſervation of juſtice and equity. Engliſh juriſprudence regards the civil code as a relic of deſpotiſm; and therefore rarely liſtens to the papal voice of the canon law. The moſt ſingular uſages are what was termed *borough Engliſh*, by which the youngeſt ſon, or in defect of iſſue, the youngeſt brother, was to enjoy the heritage; as it was to be preſumed that his elder brethren had learned their father's buſineſs. That of *gavel-kind* is ſcarcely known except in Kent, and has three branches: the heirs male ſhare all the land alike; each heir may ſell or alienate at the age of fifteen; and, though the father be attainted of treaſon, the inheritance paſſes to the progeny. See theſe cuſtoms and uſages under their reſpective heads in this work.

Of

Of the Engliſh courts of law, the next in dignity to the houſe of lords is the court of king's bench, ſo called becauſe the ſovereign was underſtood to judge in perſon, and its juriſdiction of courſe extends to the whole kingdom. The preſiding judge is denominated lord-chief-juſtice of England. Here are chiefly determined what are called pleas of the crown; and appeals lie from ſeveral other courts. The court of chancery judges cauſes in equity, to moderate the rigour of the law, and defend the helpleſs from oppreſſion, and eſpecially to extend relief in three caſes; fraud, accident, and breach of truſt. The chancellor himſelf is the ſupreme judge. The maſter of the rolls, or keeper of the important papers enrolled in chancery, is an officer of great dignity, and conſiderable patronage. The office of the rolls contains the charters, &c. granted by Richard III. and his ſucceſſors; thoſe of more remote antiquity being lodged in the Tower. The court of common pleas judges, as the name imports, of the common ſuits between ſubject and ſubject; and tries all civil cauſes, real, perſonal, or mingled, according to the preciſe precepts of the law. The court of exchequer, ſo termed from the ancient mode of accounting upon a checquered board, decides all cauſes relating to the royal treaſury or revenue. See the article COURTS OF LAW, vol. v. p. 297—306.

For the more commodious and general diſtribution of juſtice, the kingdom is divided into ſix circuits, which are viſited by the judges in ſpring and autumn, when they ſit and determine all cauſes of importance, civil and criminal. See the article CIRCUIT, vol. iv. p. 610. The more minute caſes are determined by juſtices of the peace, who may be traced as far back as the fourth year of Edward III. Their office is chiefly to commit criminals to priſon, and to inſpect the execution of particular laws, relating to the poor, highways, peace, decorum, and orderly behaviour of alehouſe-keepers, labourers, artificers, &c. They have a commiſſion under the great ſeal, and the moſt reſpectable are ſtyled juſtices of the quorum, from the words in the commiſſion, *Quorum* A. B. *unum eſſe volumus*. The *cuſtos rotulorum*, or keeper of the rolls, produces them at the quarter ſeſſions, where the juſtices meet once in three months: the grand inqueſt, or jury of the county, is here ſummoned, which enquires concerning all crimes and miſdemeanours within its juriſdiction.

The office of ſheriff, or præfect of the county, is to execute the royal mandates, to impannel juries, to bring perſons to trial, and to ſee the ſentences executed, to collect fines, and remit them to the exchequer, and to preſerve the tranquillity of the ſhire. On the circuits he meets and attends the judges, with a gallant train of officers and ſervants. The ſheriffs are annually pricked with a golden needle, by the king, out of a liſt of ſix gentlemen of the county, drawn up by the judges.

The proteſtant religion forms the eſtabliſhed doctrine of the church of England, founded upon a moſt peculiar baſis, and truly characteriſtic of a moderate and judicious people. It is the only reformed church which has retained epiſcopacy in its ancient ſplendour: for though biſhops may alſo be found in Denmark, Sweden, Norway, &c. they are rather inſpectors of the conduct of the clergy, and of the modes of education, than prelates endowed with ſenatorial rank and dignity. In England, on the contrary, the biſhops are peers of parliament, and have the ſtyle and importance of nobility. Yet the creed of the Engliſh church is rather Calviniſtic than Lutheran. But the ſpecial tenets of the Engliſh church are ſufficiently explained in the thirty-nine articles.

The orders of biſhops, prieſts, and deacons, compoſe the body of the Engliſh clergy. Upon his diſpute with the pontiff, to avoid any claims whatever of ſuperiority, Henry VIII. aſſumed the title of ſupreme head of the national church, and iſſued ſeveral medallions with inſcriptions in Hebrew, Greek, and Latin, to commemorate this new prerogative, which is, indeed, important, as it blends the eccleſiaſtic with the civil adminiſtration. Next in dignity and power to the king, are the archbiſhops of Canterbury and York. The firſt is ſtyled primate of all England, and precedes all perſons except the royal family. The archbiſhop of York is alſo ſtyled primate of England, but in prerogative and juriſdiction yields to the firſt metropolitan. The archiepiſcopal office is rather a dignity than a juriſdiction, and the primates rarely interfere in any dioceſe except their own. They are appointed by the king, in the ſame manner as the biſhops, by what is called a *congé d'élire*.

The biſhops ordain deacons and prieſts, dedicate churches and burial grounds, and adminiſter confirmation. In former times, epiſcopal juriſdiction extended to the licenſing of phyſicians, ſurgeons, and ſchoolmaſters, and to the uniting of ſmall pariſhes. At preſent, it chiefly embraces queſtions of births, marriages, deaths, and teſtaments, and any delinquencies of the clergy; to which body, indeed, their attention is now chiefly confined, and they rarely, except in parliament, interfere in ſecular ſubjects. The biſhop of Sodor and Man has no place in parliament. All the other biſhops are barons, and peers of the realm, by three different claims; in right of the baronies attached to their ſees, as barons ſummoned by writ, and as barons by patent; a form which accompanies their conſecration. Their privileges approach the regal; they are the ſole judges in their own courts, and iſſue writs in their own names, not in the royal ſtyle uſed by other courts. They can depute their authority, which no other judge can; and their epiſcopal power of conferring orders, &c. may be exerted in any Chriſtian country, while lay peers are only acknowledged in the country whence they derive their dignities. For the particular functions and privileges of the archbiſhops and biſhops, and number of biſhoprics, with their value in the king's books, and the era of their foundation, ſee vol. ii. p. 46, 47. Vol. iii. p. 65—68. Vol. iv. p. 660. Vol. v. p. 290, 300, 629, and 833.

Thoſe who differ in tenets or forms from the eſtabliſhed church of England, may, in general, be ſtyled diſſenters; though the term be more ſtrictly applied to the preſbyterians and independents. The other principal claſſes of diſſidents, are the catholics, methodiſts, quakers, anabaptiſts, Swedenborgians, and unitarians; the laſt claſs deny the trinity, and believe only in one God. Upon the whole, it muſt be admitted as a ſtriking feature of the Engliſh government, that as far as prudence and diſcretion goes, after contemplating its political hiſtory, it has no diſpoſition to fetter men's minds, but allows an ample toleration, and the free and uninterrupted exerciſe of their religion, to diſſenters of every kind.

ARMY AND NAVY.

In a land of liberty it is extremely dangerous to make a diſtinct order of the profeſſion of arms. In ſuch no man ſhould take up arms, but with a view to defend his country and its laws: he puts not off the citizen when he enters the camp; but it is becauſe he is a citizen, and would wiſh to continue ſo, that he makes himſelf for a while a ſoldier. The laws and conſtitutions of theſe kingdoms know no ſuch ſtate as that of a perpetual ſtanding ſoldier, bred up to no other profeſſion than that of war; and it was not till the reign of Henry VII. that the kings of England had ſo much as a guard about their perſons. It ſeems univerſally agreed by all hiſtorians, that king Alfred firſt ſettled a national militia in this kingdom, and by his prudent diſcipline made all the ſubjects of his dominions ſoldiers. See p. 550. In the mean time we are not to imagine that the kingdom was left wholly without defence, in caſe of domeſtic inſurrections, or the proſpect of foreign invaſions. Beſides thoſe, who, by their military tenures, were bound to perform forty days ſervice in the field, the ſtatute of Wincheſter obliged every man, according to his eſtate and degree, to provide a determinate quantity of ſuch arms as were then in uſe, in order to keep the peace; and conſtables were appointed in all hundreds, to ſee that ſuch arms were provided. Theſe weapons were changed

by the ſtatute 4 and 5 Philip and Mary, c. 2. into others of more modern ſervice: but both this and the former proviſions were repealed in the reign of James I. While theſe continued in force, it was uſual, from time to time, for our princes to iſſue commiſſions of array, and ſend into every county officers in whom they could confide, to muſter and array (or ſet in military order) the inhabitants of every diſtrict; and the form of the commiſſion of array was ſettled in parliament in the 5th of Henry IV. But at the ſame time it was provided, that no man ſhould be compelled to go out of the kingdom at any rate; nor out of his ſhire, but in caſes of urgent neceſſity; nor ſhould provide ſoldiers unleſs by conſent of parliament. About the reign of king Henry VIII. lord-lieutenants began to be introduced, as ſtanding repreſentatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the ſtatute 4 and 5 Philip and Mary, c. 3. though they had not been then long in uſe; for Camden ſpeaks of them in the time of queen Elizabeth as extraordinary magiſtrates, conſtituted only in times of difficulty and danger. Soon after the reſtoration of king Charles II. when the military tenures were aboliſhed, it was thought proper to aſcertain the power of the militia, to recogniſe the ſole right of the crown to govern and command them, and to put the whole into a more regular method of military ſubordination: and the order in which the militia, now ſtands by law, is principally built upon the ſtatutes which were then enacted. It is true, the two laſt of them are apparently repealed; but many of their proviſions are re-enacted, with the addition of ſome new regulations, by the preſent militia-laws; the general ſcheme of which, is to diſcipline a certain number of the inhabitants of every county, choſen by lot for three years, and officered by the lord-lieutenant, the deputy lieutenants, and other principal land-holders, under a commiſſion from the crown. They are not compellable to march out of their counties, unleſs in caſe of invaſion, or actual rebellion, nor in any caſe to be ſent out of the kingdom. They are to be exerciſed at ſtated times, and their diſcipline in general is liberal and eaſy; but, when drawn out into actual ſervice, they are ſubject to the rigours of martial law, as neceſſary to keep them in order. This is the conſtitutional ſecurity which our laws have provided for the public peace, and for protecting the realm againſt foreign or domeſtic violence, and which the ſtatutes declare, is eſſentially neceſſary to the ſafety and proſperity of the kingdom; the militia, however, cannot be called forth and embodied but by an act of the legiſlature.

But, as the faſhion of keeping ſtanding armies has univerſally prevailed over all Europe of late years, (though ſome of its potentates, being unable themſelves to maintain them, are obliged to have recourſe to richer powers, and receive ſubſidiary penſions for that purpoſe,) it has alſo for many years paſt been annually judged neceſſary by our legiſlature, for the ſafety of the kingdom, the defence of the poſſeſſions of the crown of Great Britain, and the preſervation of the balance of power in Europe, to maintain, even in time of peace, a ſtanding body of troops, under the command of the crown; who are, however, *ipſo facto*, diſbanded at the expiration of every year, unleſs continued by parliament. The land forces of theſe kingdoms, in the time of peace, amount to about 40,000 men, including troops and garriſons in Ireland, Gibraltar, the Eaſt Indies, and America; but in time of war, there have formerly been in Britiſh pay, natives and foreigners, above 150,000; and there have been in the pay of Great Britain, ſince the commencement of the preſent war, 139,000 men, beſides 60,000 militia. To keep this body of troops in order, an annual act of parliament paſſes, "to puniſh mutiny and deſertion, and for the better payment of the army and their quarters." This regulates the manner in which they are to be diſperſed among the ſeveral innkeepers and victuallers throughout the kingdom; and eſtabliſhes a law martial for their government. By this, among other things, it is enacted, that if any officer and ſoldier ſhall excite or join in any mutiny, or knowing of it ſhall not give notice to the commanding officer; or ſhall deſert, or liſt in any other regiment, or ſleep upon his poſt, or leave it before he is relieved, or hold correſpondence with a rebel or enemy, or ſtrike or uſe violence to his ſuperior officer, or ſhall diſobey his lawful command; ſuch offender ſhall ſuffer ſuch puniſhment as a court-martial ſhall inflict, though it extend to death itſelf.

Officers and ſoldiers that have been in the king's ſervice, are, by ſeveral ſtatutes enacted at the cloſe of ſeveral wars, at liberty to uſe any trade or occupation they are fit for, in any town of the kingdom, (except the two univerſities,) notwithſtanding any ſtatute, cuſtom, or charter, to the contrary. And ſoldiers, in actual military ſervice, may make verbal wills, and diſpoſe of their goods, wages, and other perſonal chattels, without thoſe forms, ſolemnities, and expences, which the law requires in other caſes.

At the breaking out of the preſent war, an invaſion of this country by the French being daily expected, an act was brought in for the defence of the kingdom, commonly called the General Defence Act, by which all the effective men were made liable to be called out in claſſes, enrolled, and exerciſed in their pariſhes, or otherwiſe, ſo as to be ready to march in caſe of actual invaſion. But the law was not acted upon, in conſequence of the public ſpirit of the nation, which induced perſons to come forward *voluntarily*, ſo as to anſwer every intent required by the defence act. The liſts however were made out, in caſe it ſhould hereafter be neceſſary to enforce the act; and by the abſtract laid before the houſe of commons, in June, 1804, it appears that the following are the total numbers of each claſs:

Number in 1ſt claſs effective	552,619
——— in 2d claſs effective	138,752
——— in 3d claſs effective	315,653
——— in 4th claſs effective	794,291
Voluntary ſervice	482,761
Army, marines, volunteer corps, ſea fencibles	176,780
Clergy, licenſed teachers, medical men, and conſtables	29,878
Infirm	118,322
Total	2,609,056

And in the houſe of commons, in the month of April, 1804, Mr. Addington, then chancellor of the exchequer, ſtated our army in round numbers, as follows:

Regulars, including militia and cavalry	184,000
Volunteers	400,000
Total	584,000

The maritime ſtate is nearly related to the former; though much more agreeable to the principles of our free conſtitution. The royal navy of England hath ever been its greateſt defence and ornament; it is its ancient and natural ſtrength; the floating bulwark of the iſland; an army, from which, however ſtrong and powerful, no danger can ever be apprehended to liberty: and accordingly it has been aſſiduouſly cultivated, even from the earlieſt ages. To ſo much perfection was our naval reputation arrived in the twelfth century, that the code of maritime laws, which are called the laws of Oleron, and are received by all nations in Europe as the ground and ſubſtruction of all the marine conſtitutions, was confeſſedly compiled by king Richard I. at the iſle of Oleron, on the coaſt of France, then part of the poſſeſſions of the crown of England. And yet, ſo vaſtly inferior were our anceſtors in this point to the preſent age, that even in the reign of queen Elizabeth, ſir Edward Coke thinks it matter of boaſt that the royal navy of England then conſiſted of thirty-three ſhips. The preſent condition of our marine is in great meaſure owing to the ſalutary proviſions of the ſtatute called the Navigation-act; whereby the conſtant

increaſe of Engliſh ſhipping and ſeamen was not only encouraged, but rendered unavoidably neceſſary. The moſt beneficial ſtatute for the trade and commerce of theſe kingdoms, is that navigation act; the rudiments of which were firſt framed in 1650, partly with a narrow view; being intended to mortify the ſugar iſlands, which were diſaffected to the parliament, and ſtill held out for Charles II. by ſtopping the gainful trade which they then carried on with the Dutch; and at the ſame time to clip the wings of thoſe our opulent and aſpiring neighbours. This prohibited all ſhips of foreign nations from trading with any Engliſh plantations, without licence from the council of ſtate. In 1651, the prohibition was extended alſo to the mother country; and no goods were ſuffered to be imported into England, or any of its dependencies, in any other than Engliſh bottoms, or in the ſhips of that European nation of which the merchandiſe imported was the genuine growth or manufacture. At the reſtoration, the former proviſions were continued, by ſtatute 12 Charles II. c. 18. with this very material improvement, that the maſter, and three-fourths of the mariners, ſhall alſo be Engliſh ſubjects. The complement of ſeamen, in time of peace, uſually hath amounted to 12 or 15,000. In time of war, they have formerly amounted to 80,000 men; and, after the commencement of the preſent war, they amounted to 102,000 men, including marines, which was 2000 beyond the number voted by parliament.

This navy is commonly divided into three ſquadrons; namely, the red, white, and blue, which are ſo termed from the differences of their colours. Each ſquadron has its admiral: but the admiral of the red ſquadron has the principal command of the whole, and is ſtyled vice-admiral of Great Britain. Subject to each admiral is alſo a vice and rear admiral. But the ſupreme command of our naval force is, next to the king, in the lords commiſſioners of the admiralty. Notwithſtanding our favourable ſituation for a maritime power, it was not until the vaſt armament ſent to ſubdue us by Spain, in 1588, that the nation, by a vigorous effort, became fully ſenſible of its true intereſt and natural ſtrength, which it has ſince ſo happily cultivated.

Many laws have been made for the ſupply of the royal navy with ſeamen; for their regulation when on board; and to confer privileges and rewards on them, during and after the ſervice.

1. For their ſupply. The power of impreſſing men, for the ſea ſervice, by the king's commiſſion, has been a matter of ſome diſpute, and ſubmitted to with great reluctance; though it hath very learnedly been ſhewn by ſir Michael Forſter, that the practice of impreſſing, and granting powers to the admiralty for that purpoſe, is of very ancient date, and hath been uniformly continued by a regular ſeries of precedents, to the preſent time; whence he concludes it to be a part of the common law. The difficulty ariſes from hence, that no ſtatute, or act of parliament, has expreſsly declared this power to be in the crown, though many of them very ſtrongly imply it. It has alſo been ſuppoſed, that a practice ſo unfavourable to the liberty of the ſubject, and to common principles of juſtice and humanity, could not be ſolidly ſupported without ſome clear, poſitive, and unequivocal, law. Beſides this method of impreſſing, (which even if legal, is only defenſible from public neceſſity, ſuch as an actual rebellion or invaſion of the kingdom, to which all private conſiderations muſt give way,) the principal trading cities, and ſometimes the government, offer bounty money to ſeamen who enter voluntarily into his majeſty's ſervice; and every foreign ſeamen who, during a war, ſhall ſerve two years in any man of war, merchantman, or privateer, is naturalized *ipſo facto*.

2. The method of ordering ſeamen in the royal fleet, and keeping up a regular diſcipline there, is directed by certain expreſs rules, articles, and orders, firſt enacted by the authority of parliament, ſoon after the reſtoration; but new modelled and altered ſince the peace of Aix la Chapelle, to remedy ſome defects which were of fatal conſequence in conducting the preceding war. In theſe articles of the navy, almoſt every poſſible offence is ſet down, and the puniſhment thereof annexed; in which reſpect the ſeamen have much the advantage over their brethren in the land ſervice, whoſe articles of war are not enacted by parliament, but framed from time to time at the pleaſure of the crown.

3. With regard to the privileges conferred on ſailors, they are pretty much the ſame with thoſe conferred on ſoldiers; with regard to relief, when maimed, or wounded, or ſuperannuated, it is afforded them either by county rates, or from the royal hoſpital at Greenwich; they are alſo allowed the exerciſe of trades in corporations, and the power of making teſtaments; and, further, no ſeamen on-board his majeſty's ſhips can be arreſted for any debt, unleſs the ſame be ſworn to amount to at leaſt twenty pounds; though, by the annual mutiny act, a ſoldier may be arreſted for a debt which extends to half that value, but not for leſs amount.

We ſhall cloſe this account of the military and maritime ſtrength of England or rather of Great Britain, by obſerving, that though ſea officers and ſailors are ſubject to a perpetual act of parliament, which anſwers the annual military act, that is paſſed for the government of the army, yet neither of thoſe bodies are exempted from legal juriſdiction in civil or criminal caſes, but in a few inſtances of no great moment. The ſoldiers, particularly, may be called upon by a civil magiſtrate to enable him to preſerve the peace againſt all attempts to break it. The military officer, who commands the ſoldiers on thoſe occaſions, is to take his directions from the magiſtrate; and both he and they, if their proceedings are regular, are indemnified againſt all conſequences, be they ever ſo fatal. Thoſe civil magiſtrates who underſtand the principles of the conſtitution, are, however, extremely cautious in calling for the military on theſe occaſions, or upon any commotion whatever: and, indeed with good reaſon; for, the frequent employment of the military power, in a free government, is exceedingly dangerous, and cannot be guarded againſt with two much caution.

The following is a ſtatement of the numbers and diſtribution of the Britiſh naval force, in Auguſt, 1804, excluſive of the hired armed veſſels, which are chiefly employed in protecting the coaſting trade.

COMMERCE, MANUFACTURES, PUBLIC REVENUE, AND PRESENT STATE.

It was not till the reign of queen Elizabeth, that the commerce of England firſt began to make a figure in the trade of Europe. In the ſecond year of her reign, the queen cauſed gunpowder to be made in England, which, till this time, had been ſupplied by the German Steel-yard company; ſhe alſo cauſed braſs and iron ordnance to be caſt, and built a conſiderable number of ſhips of war, forming the moſt important fleet that England had ever ſeen; inſomuch, that foreigners ſtyled her "the reſterer of naval glory, and queen of the northern ſeas." Her wealthieſt merchants alſo, after her example, began to build ſhips with great alacrity; and, on any emergency, readily joined them with the national fleet, which enabled her to ſend out twenty thouſand fighting men for ſea ſervice. Amidſt this proſperity, it was no ſmall mortification to the queen, that, having no military ſtores of her own production, ſhe was ſtill neceſſitated to obtain them of the German Steel-yard merchants, at their own prices, there being then but few Engliſh merchants dealing in that way; and this was one of her greateſt inducements for encouraging commercial companies amongſt her own ſubjects. To ſhew that this period was but the dawning of the day of Britiſh commerce, we may here remark, that queen Elizabeth, in the third year of her reign, was preſented, by her ſilk woman, Mrs. Montague, with a pair of black knit ſilk ſtockings, the firſt of the ſort known in England; and thenceforth ſhe never wore cloth ones any more. Dr. Howell, in his Hiſtory of the World, relates, that Henry VIII. that magnificent and expenſive prince, generally wore cloth hoſe, except there came from Spain, by great chance, a pair of ſilk ſtockings; for Spain very early abounded in ſilk. His ſon, Edward VI. was preſented with a pair of long Spaniſh ſilk ſtockings by ſir Thomas Greſham; and the preſent was much taken notice of at court. From henceforward, not only trade and commerce, but every ſpecies of domeſtic convenience and national advantage, was wiſely and liberally promoted. The manufacture of alum was alſo, in 1608, firſt invented, and ſucceſsfully practiſed in England, under the patronage of James I. by lord Sheffield and ſir John Bourchier, who opened manufactories of this article in Yorkſhire, and warehouſes in London, which were greatly encouraged by government. The king alſo, in 1610, built the largeſt and fineſt ſhip of war, that ever England had before ſeen, carrying ſixty-four cannon, and of fourteen hundred tons burthen. Thus, we may in part ſee, by what gradual ſteps the royal navy of England arrived at its preſent magnitude and grandeur.

The commerce of the world being in perpetual fluctuation, we can never be too watchful, not only for preſerving the invaluable portion we are now in poſſeſſion of, but for availing ourſelves of the miſtakes or negligences of other nations, in order to acquire new branches of it. See the article COMMERCE, vol. iv. p. 856. Who could have imagined, three hundred years ago, that thoſe ports of the Levant, from whence, by means of the Venetians, England, and almoſt all the reſt of Chriſtendom, were ſupplied with the ſpices, drugs, &c. of India and China, ſhould one day come themſelves to be ſupplied with thoſe very articles by the remote countries of England and Holland, at an eaſier rate than they were uſed to have them directly from the eaſt? or, that Venice ſhould afterwards loſe to Liſbon the lucrative trade of ſupplying the reſt of Europe with them? or, laſtly, that Liſbon ſhould afterwards loſe the ſame to Amſterdam: or that Amſterdam and Haerlem ſhould gradually loſe, as in great part they have done, their famous fine linen manufactures to Ireland and Scotland? At preſent, our woollen manufacture is the nobleſt in the univerſe; and ſecond to it is our metallic manufacture of iron, ſteel, tin, copper, lead, and braſs, which is ſuppoſed to employ upwards of half a million of people. Our unmanufactured wool alone, of one year's produce or growth, has been lately eſtimated to be worth two millions of money ſterling; and, when manufactured it is valued at ſix millions more, and is thought to employ upwards of a million of our people in its manufacture; whereas in former times all our wool was exported to foreign countries unmanufactured, and our own people remained at home unemployed.

Our trade to the Eaſt Indies alone, conſtitutes one of the moſt ſtupendous political, as well as commercial machines, that is to be met with in hiſtory. The trade itſelf is excluſive, and lodged in a company, which has a temporary monopoly of it, in conſideration of money advanced to the government. See EAST-INDIA COMPANY, vol. iv. p. 875. Without entering into the hiſtory of the trade, and the company's concerns in that country, it is ſufficient to ſay, that, beſides their ſettlements on the coaſt of the peninſula of Aſia, which they enjoy under certain reſtrictions by act of parliament; they have, through the various internal revolutions which have happened in Hindooſtan, and the ambition or avarice of their ſervants and officers, acquired ſuch territorial poſſeſſions, as render them the moſt formidable commercial republic (for ſo it may be called in its preſent ſituation) that has been known in the world ſince the demolition of Carthage. For the Britiſh arms have lately been carried by generals Welleſley and Lake, further than ever Alexander the Great penetrated in India. Theſe happy ſucceſſes were followed by a peace ſigned between the Eaſt India company and the rajah of Berar, on the 17th of December, 1803; and with the chief of the Mahrattas on the 30th of the ſame month.

The manufactures and commerce of England at the preſent day, form ſo extenſive an income to the nation at large, and produce ſuch a conſiderable revenue by the cuſtoms and exciſe, that the unparalleled proſperity of the government ſeems to have ariſen in great meaſure from this unbounded ſource of wealth. Whenever money is wanted by the miniſter, the commercial men are applied to; and theſe *monied men*, as they are called, have it always ready to advance; be the millions what they may, of which the loan conſiſts; an evident proof of the riches ſtill acquired by individuals from trade and commerce, in ſpite of the heavy duties and taxes with which they are burthened. To trace the origin of our commerce, we muſt obſerve, that the earlieſt ſtaple commodity of England was tin, a metal rarely found in other countries. The Phœnicians at a very remote era firſt introduced it into commerce, and their extenſive trade ſoon diffuſed it among the Oriental nations. The Romans, upon their conqueſt of theſe regions, did not neglect this ſource of wealth; but as Cornwall was not conquered by the Anglo-Saxons till the reign of Athelſtan, we know not whether the Corniſh Briſons carried on any conſiderable traffic in this commodity, though it is probable that it was at leaſt exchanged for the wines of France. The ſingularity and importance of this firſt national ſtaple, has not been ſufficiently noticed by the Engliſh hiſtorians. Wool had been regarded as the grand ſtaple of England, as early as the twelfth century, but was chiefly exported in a crude ſtate, till Edward III. encouraged ſettlements of Flemiſh manufacturers. Wool then became the ſtandard of private property, and the prime article of commerce. Taxes and foreign ſubſidies were eſtimated by ſacks of this commodity. Great quantities of raw wool continued to be exported to the Netherlands and Hanſe Towns; but queen Elizabeth cauſed it to be chiefly manufactured at home, and the exportation of woollen cloths was then valued at a million and a half annually.

In recent times, the manufactures of iron and copper, as native minerals, have become great ſources of national wealth; nor ſhould the new and extenſive exportation of elegant porcelain be forgotten. The cotton manufacture is diffuſed far and wide, forming a grand ſource of national induſtry and proſperity. That of linen is not ſo much cultivated in England as in Ireland and Scotland; though nature would rather demand that flax ſhould be more cultivated in this fertile country, while ſheep and wool were reſtricted to the alpine paſtures of Scotland. The

manufactures of glafs and fine fteel, clocks, watches, &c. are defervedly eminent and extenfive. As the nation is indebted to Wedgewood for converting clay into gold, fo to the engraving artifts we owe another elegant branch of modern exportation, that of beautiful prints.

The Englifh manufactures, in their prefent ftate, are eftimated at the annual value of 63,600,000l. and are fuppofed to employ 1,585,000 perfons. Of thefe the woollen manufacture is fuppofed to yield in round fums, 15,000,000l. the leather 10,000,000l. the iron, tin, and lead 10,000,000l. the cotton 9,000,000l. The other chief manufactures, which yield from 1 to 4,000,000l. may be thus arranged, according to their confequence, fteel, plating, &c. copper and brafs, filk, potteries, linen and flax, hemp, glafs, paper.

The commerce of England, in the prefent period, may be faid to extend to every region of the globe. It was conceived that the defection of the American colonies, would have proved detrimental in this view; but the commercial confequences have been more beneficial; which ftrongly proves the aflertion of Dr. Adam Smith, "that a free trade is ever moft productive." The trade with the Weft Indies furnifhes another grand refource; while that with the eaftern world would have aftonifhed the moft celebrated trading cities of antiquity. The following Table will prefent a more complete epitome of the fubject, than could otherwife be conveyed. It fhews, at one view, the progreffive increafe of the Exports and Imports of Great Britain for the whole of the laft century.

1802	30,300,000	0	0	48,500,663	0	0

The net produce of the Duties of Cuftoms, for three years, ending the 5th of January, 1802, was as follows:

1799	£8,556,598	8	3½
1800	8,125,036	19	5
1801	8,804,226	4	11

The aggregate value of goods imported into London in one year . . .	£29,706,476	17	4
Britifh manufactures exported	11,396,539	13	8
Foreign merchandize do.	14,208,925	14	6
Value of goods imported in upwards of 9000 coafting veffels, averaged at 500l. each	4,500,000	0	0
Value of goods exported coaftways in about 7000 veffels, at 1000l. each .	7,000,000	0	0
Total amount of property fhipped and unfhipped in the river Thames, in the courfe of a year, is thus eftimated at	£66,811,942	5	6

If

If to this eſtimate be added thoſe of the ports of Liverpool, Briſtol, &c. how enormous muſt be the amount!

On the introduction of the income tax, in the year 1798, Mr. Pitt gave the following eſtimate of the annual rental of Great Britain:

The land rental, after deducting one-fifth	£20,000,000
Tenant's rental of land, deducting two-thirds of the rack-rent	6,000,000
Amount of tythes, deducting one-fifth	4,000,000
Produce of mines, canal navigation, &c. deducting one-fifth	3,000,000
Rental of houſes, deducting one-fifth	5,000,000
Profits of profeſſions	2,000,000
Rental of Scotland, taking it at one-eighth of that of England	5,000,000
Income of perſons reſident in Great-Britain, drawn from poſſeſſions beyond the ſeas	5,000,000
Amount of annuities from the public funds, after deducting one-fifth for exemptions and modifications	12,000,000
Profits on the capital employed in our foreign commerce	12,000,000
Profits on the capital in domeſtic trade, and the profits of ſkill and induſtry	28,000,000
Total	£102,000,000

By others, the landed property of Great Britain has been computed at the rental of 33,000,000l. which, at thirty years purchaſe, would yield 990,000,000l.; the rental of houſes in England and Wales, at 7,436,000l. and eſtimating that of Scotland at about a ſixth, the value at fifteen years purchaſe, might be about 130,000,000l. The cattle and farming-ſtock, about 100,000,000l. the furniture, apparel, &c. 26,000,000l. The navy and merchant-ſhips have been valued at 16,000,000l.; the goods in the hands of merchants and wholeſale dealers, more than 13,000,000l. and thoſe in the hands of manufacturers and retail traders, more than 22,000,000l. Including the money, of which the eſtimate is far from certain, the whole capital of Great Britain may be calculated at more than one thouſand two hundred millions. In the beginning of the eighteenth century, Gregory King eſtimated the value of England and Wales at 650,000,000l. *MS. Harl.* No. 1,898. Againſt the preceding rental and total valuation, is to be placed the national debt, which is now (July, 1804,) 484,162,622l. 7s. 3¾d.

The national debt, is the principal money due from the government to the public, borrowed through the medium of the joint ſtock companies, to anſwer the immediate exigencies of the ſtate. In order to trace the origin of this debt, we muſt recollect, that after the revolution, when our new connections with Europe introduced a new ſyſtem of foreign politics, the expences of the nation, not only in ſettling the new eſtabliſhment, but in maintaining long wars, as principals, on the continent, for the ſecurity of the Dutch barrier, reducing the French monarchy, ſettling the Spaniſh ſucceſſion, ſupporting the houſe of Auſtria, maintaining the liberties of the Germanic body, and other purpoſes, increaſed to an unuſual degree; inſomuch that it was not thought adviſeable to raiſe all the expences of any one year by taxes to be levied within that year, leſt the unaccuſtomed weight of them ſhould cruſh the people. It was therefore the bad policy of the times, to mortgage the revenues of their poſterity, by borrowing immenſe ſums for the current ſervice of the ſtate, and to lay no more taxes upon the ſubject than would ſuffice to pay the annual intereſt of the ſums ſo borrowed; by this means converting the principal debt into a new ſpecies of property, transferable from one man to another, at any time, and in any quantity. A ſyſtem which ſeems to have had its origin in the ſtate of Florence, A. D. 1344; which government then owed about 60,000l. ſterling; and, being unable to pay it, formed the principal into an aggregate ſum, called metaphorically, a mount or bank; the ſhares whereof were transferable like our ſtock. This laid the foundation of what is called the national debt: and the example then ſet, has been ſo cloſely followed during the long wars in the reign of queen Anne, and ſince her time to the preſent, that its amount is become a moſt enormous ſum. In order that every reader may form a competent idea of this intereſting ſubject, we ſhall ſtate its progreſs.

In the year 1740, immediately before the commencement of the war, the principal money of the national debt amounted to	£46,382,650
In 1749, immediately after the war	78,166,906
Diminiſhed by the peace from 1749 to 1755	3,089,641
Amount at the beginning of the war, in 1755	75,077,264
At the termination of that war, in 1763	122,603,336
In the year 1786, it was	266,755,203
In 1793	227,989,000
In 1801, excluſive of imperial loan, &c.	400,709,000
In July, 1804	481,162,622

The intereſt of which is 16,045,691l. annually.

The certain revenues of the kings of England, were anciently greater than thoſe of any king in Europe; and till the time of the civil wars, they enjoyed in domains and fee-farm rents almoſt enough to diſcharge all the ordinary expences of the crown, without any tax or impoſition on the ſubject. The revenues which the Britiſh conſtitution hath veſted in the royal perſon, in order to ſupport his dignity, and maintain his power, are either *ordinary* or *extraordinary*; and of the ordinary revenues there are four of an eccleſiaſtical kind: as, 1. The cuſtody of the temporalities of vacant biſhoprics; from which he receives little or no advantage. 2. Corodies and penſions, formerly ariſing from allowances of meat, drink, and clothing, due to the king from an abbey or monaſtery, and which he generally beſtowed upon favourite ſervants; and his ſending one of his chaplains to be maintained by the biſhop, or to have a penſion beſtowed upon him till the biſhop promoted him to a benefice. Theſe corodies are due of common right, but are now diſuſed. 3. Extra-parochial tithes. 4. The firſt-fruits and tenths of benefices. At preſent, ſuch has been the bounty of the crown to the church, that thoſe four branches afford little or no revenue. The king's ordinary temporal revenue conſiſts in, 1. The demeſne lands of the crown, which at preſent are contracted within a narrow compaſs. 2. The hereditary exciſe; being part of the conſideration for the purchaſe of his feudal profits, and the prerogatives of purveyance and pre-emption. 3. An annual ſum iſſuing from the duty on wine licences; being the reſidue of the ſame conſideration. 4. His foreſts. 5. His courts of juſtice, &c. Such is the king's ordinary revenue, or the proper patrimony of the crown, which was formerly of a magnitude truly formidable; but, fortunately for the liberty of the ſubject, this *hereditary landed revenue* is now ſunk almoſt to nothing; and the caſual profits, ariſing from the other branches of the *cenſus regalis*, are likewiſe moſt of them alienated from the crown. In order to ſupply the deficiencies of which, we have now recourſe to methods of raiſing money, which conſtitute the king's *extraordinary* revenue; which are called by the ſynonymous names of aids, ſubſidies, ſupplies, &c. and are granted by the commons of Great Britain in parliament aſſembled; and that part which goes to the maintenance of the royal perſon, with all its contingencies, is called the *civil liſt*. Theſe contingent expences are all thoſe which in any ſhape relate to civil government; ſuch as the expences of the houſehold, all ſalaries to officers of ſtate, to the judges, and every one of the king's ſervants; the appointments to foreign ambaſſadors, the maintenance of the queen and royal family, the king's private expences, or privy purſe, and other very numerous out-goings; as ſecret ſervice-money, penſions, and other gratuities. Hence the *civil liſt* is properly the whole of the king's revenue in his own diſtinct capacity;

city; the reſt being rather the revenue of the nation; ſeeing his preſent majeſty, ſoon after his acceſſion to the throne, ſpontaneouſly reſigned his own hereditary revenues into the hands of the public, and accepted in lieu of them the ſpecific ſum of 800,000l. per annum; ſo that the hereditary revenues are now carried into, and made part of the annual income of the country; and as 800,000l. was found barely ſufficient to ſupport the ſtate and dignity of the ſovereign, an additional 100,000l. has ſince been added to it; ſo that the *civil liſt*, or income of the king, is now 900,000l. per annum, which is always provided in the annual taxes and ſupplies. The annual taxes are, 1. The land tax, or the ancient ſubſidy raiſed upon a new aſſeſſment. 2. The malt tax, being an annual exciſe upon malt, mum, cyder, and perry. The perpetual taxes are, 1. The cuſtoms, or tonnage and poundage of all merchandize exported or imported. 2. The exciſe duty, or inland impoſition, on a great variety of commodities. 3. The ſalt duty. 4. The poſt-office, or duty for the carriage of letters. 5 The ſtamp duty on paper, parchment, &c. 6. The duty on houſes and windows. 7. The duty on licences for hackney coaches and chairs. 8. The duty on offices and penſions; with a variety of new taxes ſince impoſed. The clear net produce of theſe ſeveral branches of the revenue, old and new taxes, after all charges of collecting and management paid, is called *The annual revenue of the nation*, out of which is paid the intereſt of the different ſtocks compoſing the national debt, the civil liſt, the navy, ordnance, and army expenditures, and every other ſpecies of claim that can be made upon the the public. To illuſtrate this ſubject more extenſively, we have ſubjoined the following correct ſtatement of the annual income of the nation, calculated from the average of ſeven years receipts and diſburſements, as delivered in by the ſelect committee of finance, to the houſe of commons.

The INCOME, or net produce of the *permanent taxes*, (excluſive of land and malt,) exiſting *previous* to 5th January, 1793, was,

In the year ending	5th January, 1793 . .	£14,284,000
	on 5th January, 1794 . .	13,941,000
	on 5th January, 1795 . .	13,858,000
	on 5th January, 1796 . .	13,557,000
	on 5th January, 1797 . .	14,292,000
	on 5th January, 1798 . .	13,332,000
	on 5th January, 1799 . .	14,275,000
	on 5th January, 1800 . .	15,743,109
	on 5th January, 1801 . .	14,194,539
	on 5th January, 1802 . .	14,497,226
	on 5th January, 1803 . .	15,425,000
	and on 5th January, 1804 . .	14,900,000

The *total* net produce of the permanent taxes, in the year ending 5th January, 1803, amounted to 28,246,681l. and, on the 5th January, 1804, the total net produce of the permanent taxes amounted to 30,754,724l. Add to either of theſe ſums 2,750,000l. for the *annual taxes* of land and malt, and the income or revenue of the nation for that year will be ſeen.

Recapitulation reſpecting the Conſolidated Fund, and the net produce of the Permanent Taxes of Great Britain, for the year 1804, from Mr. Pitt's financial ſtatements in July, 1804.

	£.	s.	d.
Total Income of the Conſolidated Fund, in the year ended 5th Jan. 1804, was	31,862,961	15	3¼
Total of the actual Payments out of the Conſolidated Fund, for the year ended 5th Jan. 1804, was	26,700,533	1	3¼
The future Annual Charge upon that Fund, as it ſtood on the 5th Jan. 1804, amounts to	26,433,874	0	7
The Total Amount of the net Produce of Permanent Taxes, in the year ended 5th Jan. 1803	28,246,681	0	0
Ditto, ditto, in the year ended 5th Jan. 1804	30,754,700	0	0
Total of the Capital redeemed by the Commiſſioners for liquidating the National Debt of Great Britain, from 1ſt Aug. 1786, to 1ſt Feb. 1804	77,698,467	0	0
For which redemption the total of ſums paid was	49,243,965	10	8
Total of Debt unredeemed 1ſt Feb. 1804	484,162,622	7	3¾
Total of Sums annually applicable to the reduction of the Public Debt of Great Britain	6,851,192	0	0
Total Amount of the Public Debt of Ireland redeemed to the 1ſt Feb. 1804	1,595,671	0	0
Total Sums paid for its Redemption	983,631	6	9
Total unredeemed 1ſt Feb. 1804 . .	43,000,000	0	0
On the 20th of June 1804, it was . .	52,500,000	0	0
Total Sums annually applicable to reduction of ditto	305,230	1	10
Total Amount of the Imperial Debt redeemed, 1ſt Feb. 1804	459,828	0	0
Total Sum paid for its Redemption	265,939	4	2
Total Debt unredeemed, 1ſt Feb. 1804	7,042,805	0	0
Sum annually applicable for its Redemption	50,487	16	9

The national EXPENDITURE, during the undermentioned years, under the heads of Intereſt and Charges of the National Debt; Intereſt of Exchequer Bills; Civil Liſt; Charges on the Aggregate and Conſolidated Funds; Navy; Army; Ordnance; Militia; Miſcellaneous Services; and Appropriated Duties, was as follows:

For the year 1786	£15,720,543
1787	15,620,783
1788	15,800,796
1789	16,030,204
1790	15,912,597
1804	33,700,679

The amount voted for the Service of the preſent Year 1804.

Navy (excluſive of 325,000l. Ordnance Sea Service)		£11,715,000
Army (England)	£15,256,000	
—— (Ireland)	3,887,000	
		19,143,000
Ordnance (England)	3,693,000	
—— (Ireland)	369,000	
		4,062,000
Vote of Credit, including 800,000l. for Ireland		2,500,000
Miſcellaneous (England) including 40,000l. for Services not yet voted	617,000	
Ditto (Ireland) including 50,000l. to be voted for Civil Contingencies	266,000	
		883,000
Iriſh Permanent Grants		400,000
Joint Charge of England and Ireland		38,703,000
Add England ſeparate Charges.		
Toulonese Ships	£ 265,000	
Deficiency of Malt Duty, 1802 . .	115,000	
American Awards	412,000	
Exchequer Bills, V. C. 1803 . .	1,500,000	
		2,292,000
Total Supplies		40,995,000
Deduct on Account of Ireland . .		4,711,652
On Account of England .		36,283,348

Ways

Ways and Means to provide for the same.

Malt Duty		£ 750,000
Duty on Penſions, Offices, &c.		2,000,000
Surplus, Ways and Means, 1803		1,370,000
War Taxes, to April 5, 1805.		
Cuſtoms and Exciſe	£ 8,200,000	
Property Tax	7,000,000	
	15,200,000	
Deduct, wanting to complete Grants, 1803	760,000	
	14,440,000	
Additional War Taxes, on Wine, Imports, Stamps	1,000,000	
		15,440,000
Surplus Conſolidated Fund, to April 5, 1805		5,000,000
Lottery		250,000
Vote of Credit		1,700,000
Loan		10,000,000
		36,510,000

That ſuch ſums ſhould be ſo eaſily raiſed, and ſo little felt, by the bulk of the people, can only be accounted for from the unbounded extent of the Britiſh commerce, and the increaſing population of the country. Hence the population of England, as in moſt other countries, becomes the beſt criterion of its proſperity and power. It has generally been eſtimated at eight millions; but ſome writers raiſe it to a much greater amount. That of the city of London has been ſwelled to a million, though reduced by more preciſe calculations to about ſeven hundred thouſand.

The cuſtoms and manners of the people of England, have always been remarked and admired for their frankneſs and ſimplicity. The plainneſs and neatneſs of their dreſs, devoid of ermin, furbelow, and gold lace, avoided by every gentleman, except on court-days and extraordinary occaſions, is no leſs ſurpriſing to the gaudy foreigner, than the ſplendid plainneſs of the muſlin dreſſes of the ladies, who have long abandoned the tight unnatural form, ſo prejudicial to health, and have aſſumed much of the Grecian eaſe and elegance.

The ſimplicity of the Engliſh cookery, alſo ſtrikes foreigners as much as that of the dreſs. A Frenchman drinks his wine during dinner; but the late Mr. Gibbon has juſtly remarked, that the luxury of a daily table in England, permits a gentleman to taſte half a dozen ſorts of wine during dinner, and to drink his bottle of claret afterwards. The red wine of Portugal is, however, a greater favourite than that of France, as its aſtringent and antiſeptic qualities, are found highly ſalutary in a moiſt climate. The houſes in England are peculiarly commodious, neat, and cleanly; and domeſtic architecture, as well as the grand and magnificent, ſeems to have arrived at the higheſt pitch of perfection.

The amuſements of the theatre and of the field, and various games of ſkill or chance, are common here, as in moſt other refined nations. Prior to the middle of the ſixteenth century, the Engliſh and French were alike regarded as barbarous nations by the more poliſhed Italians. But though the Engliſh literature was at that period confeſſedly in a rude and unpoliſhed ſtate, yet Engliſh integrity was even then conſidered as a genuine attribute of the people, and which has carried their credit and commerce to an extent before unknown in the hiſtory of nations.

The conſtruction of the Engliſh language is peculiar, and renders the ſtudy of it very difficult to foreigners. The German, and other Gothic dialects, preſent declenſions of nouns, and other correſpondencies with the Latin; while in the Engliſh all ſuch objects are accompliſhed by prefixes.—See the articles GRAMMAR and LANGUAGE. Anomalies alſo abound, and are too deeply rooted ever to be eradicated by grammatical rules; yet Engliſh literature is now become a vaſt and inviting ſource of information, amuſement, and delight.

The preſent ſtate of the arts in England, is highly worthy of ſo opulent and refined a country, and the progreſs has been rapid beyond example. The late Horace Walpole, earl of Orford, has delineated from the papers of the induſtrious Vertue, a pleaſing and animated picture of the hiſtory of the arts in this country, to which we feel great pleaſure in referring the inquiſitive reader. Education, too, forms one of the moſt important objects of an enlightened people; and it has been attended to accordingly, as the eſſence and well-being of the community. The education of the lower claſſes in England, had become extremely neglected, before the benevolent inſtitution of the ſunday ſchools. There can be no doubt that where the common people are the beſt inſtructed, there they will be found the moſt contented, orderly, and virtuous; as they feel a conſcious ſelf-reſpect, are accuſtomed to be treated with regard by each other, and will cheerfully extend the ſame reverential conduct towards their ſuperiors. A practical eſtimate of the advantages of general education, may be formed by comparing the neglected peaſantry of Ireland, with the peaceable and induſtrious Highlanders of Scotland, where public ſchools exiſt in every pariſh. The middle and higher ranks of Engliſh, much to their praiſe, ſpare no expence in the education of their children. The moſt eminent public ſchools, are thoſe of St. Paul's, Weſtminſter, Eton, and Winchester; and from them have ariſen ſome of the moſt diſtinguiſhed ornaments of this country. The ſcholars in due time proceed to the univerſities of Oxford and Cambridge, foundations of an extent and grandeur that impreſs deſerved veneration.—See the article EDUCATION, in this volume.

The climate of England, though perhaps more variable than that of any other country on the globe, occaſioned by the drying winds of the eaſtern continent oppoſing ſo vehemently the vapours of the Atlantic Ocean; yet its vegetable productions, from the great improvements made in horticulture and huſbandry, are more than ample for all the demands of home conſumption, and are excellent in their kinds. The tender wall-fruits, however, are very ſubject to fail, from the great prevalence of that moſt undefinable of evils, called the *blight*; for the ſuppoſed cauſes of which ſee vol. iii. p. 110.—The humidity of the climate, indeed, clothes the face of the country with a rich and luxuriant verdure; but it is injurious to the health of the inhabitants, by cauſing colds and catarrhs, the frequent ſources of conſumptions, which are fatal to many of the Engliſh in the prime of youth. The moiſt and foggy climate alſo conſpires with the great uſe of animal food, to produce that melancholic reſerve which is eſteemed by foreigners a national characteriſtic. In conſequence of the mutability of the climate, the ſeaſons too are always more or leſs uncertain. Many obſervers, endowed with philoſophical ſkill and candid judgment, have agreed, that ſince the year 1775, a conſiderable change ſeems to have taken place in the temperature of the ſeaſons both in Great Britain and Ireland. The winters in general have been more moiſt and mild, and the ſummers more humid and more cold, than will be found on an average of preceding years. What is called the ſpring, dawns in April, commonly indeed a mild month; but the eaſtern winds ſtill prevalent in May, ſeem commiſſioned to ruin the efforts of reviving nature, and nip the tender buds and fruits. June, July, Auguſt, and September, are uſually warm ſummer months; but a night of froſt is not unknown even in Auguſt, and ſometimes a cold eaſt wind will then blow for ſeveral days together; nor of late years are ſummers unknown of almoſt conſtant rain. The winter may be ſaid to commence with the beginning of October, at which time domeſtic fires become neceſſary; but there is ſeldom any ſevere froſt till Chriſtmas, and January is the moſt ſtern month of the year. Yet, as our ſummers often produce

ſpecimens of winter, ſo now and then gleams of warm ſunſhine illuminate the darker months. However, under all the inconveniences of our climate, it appears not that the human ſpecies in any country can boaſt of greater happineſs or longevity than the people of England; or that the comforts of life, or bleſſings of plenty, are enjoyed under the ſolace of ſofter climes with more heart-felt gratification and domeſtic felicity than in this country. Even thoſe ſucceſsful adventurers who acquire princely fortunes, we know not how, in the luxuriant regions of Aſia, fatigued with the toils of ſtate, and ſatiated with the voluptuous pleaſures of Hindooſtan, return with anxious haſte to the ſterner climate of England, to ſeek that more ſolid and rational enjoyment, which they have ſought in vain amongſt foreign nations.

London, the capital of England, may now with truth be called the METROPOLIS OF THE WORLD; ſince no city at this time exiſting can be compared with it in magnitude, riches, ſplendid ſtreets and ſquares, magnificent architecture, trade, or commerce, which is extended into almoſt every known region of the univerſe. Many others of the towns and cities of England juſtly merit regard for their magnitude, opulence, induſtry, and elegance. Briſtol for its manufactures and foreign trade ranks high, as does Bath for its ſuperior magnificence; while York, Liverpool, Mancheſter, Birmingham, Sheffield, Nottingham, Exeter, Saliſbury, Winchester, Portſmouth, Plymouth, Southampton, Poole, Canterbury, Hereford, Glouceſter, Worceſter, Coventry, Shrewſbury, Norwich, Newcaſtle, Yarmouth, Lincoln, Cheſter, Lancaſter, Hull, Leeds, Durham, Carliſle, Whitehaven, Brighthelmſtone, Lewes, Dorcheſter, Weymouth, Newport in the Iſle of Wight, &c. are celebrious in various ways, as particularized under each of their reſpective heads in this work. Thoſe which are ſea-ports, moſtly enjoy an extenſive and increaſing commerce; whilſt thoſe which are inland, and noted for their valuable mineral productions and manufactures, are extremely benefited and enriched by the great extenſion of inland navigation through every part of the kingdom.—See CANAL NAVIGATION, vol. iii. p. 675.

The bulk of the Engliſh people have received from different hiſtorians, as much praiſe for their united induſtry, hoſpitality, and orderly deportment, as for their magnanimity and unſhaken courage in times of danger. Many and various have alſo been the general characteriſtic features drawn of the Engliſh nation; the neateſt of which, we think, is that of Dr. Wendeborn, a German author, in his "View of England at the cloſe of the Eighteenth Century;" and, falling from the pen of a foreigner, devoid alike of prejudice and predilection, would appear moſt juſt. "In my opinion, (ſays this writer,) the Engliſh, of all cultivated nations, approach the neareſt to what man, in reality, ought to be; and this, I think, is their chief characteriſtic."

EN'GLAND (New). See NEW ENGLAND.

EN'GLE, *ſ.* [from the French *engluer*, to catch with birdlime.] A gull, a put, a bubble, a ſnare. *Hanmer.*

EN'GLECERY, or ENGLESCHIRE, *ſ.* [*Engleceria*, Lat.] In our ancient laws, a word ſignifying the being an *Engliſhman*. When Canute the Dane came to be king of *England*, he at the requeſt of the nobility ſent back his army into *Denmark*, but kept ſome Danes to be a guard to his perſon; and he made a law for the preſervation of his Danes (who were often privately made away with by the Engliſh), that if an *Engliſhman* killed a Dane, he ſhould be tried for the murder; or if he eſcaped, the town or hundred where the fact was done, was to be amerced ſixty-ſix marks to the king: ſo that after this law, whenever a murder was committed, it was neceſſary to prove the party ſlain to be an Engliſhman, that the town might be exempted from the amercement; which proof was called *Englecery*, or *Engleſchire*. And whereas, if a perſon were privately ſlain, he was in ancient time accounted *Francigena*, which word comprehended every alien, eſpecially the Danes: it was therefore ordained, that where any perſon was murdered, he ſhould be adjudged *Francigena*, unleſs *Englecery* were proved, and that it was made manifeſt he was an Engliſhman. The manner of proving the perſon killed to be an Engliſhman, was by two witneſſes who knew the father and mother, before the coroner. *Fleta*, l. 1. c. 30. 7 *Rep.* 16. *Englecery*, by reaſon of the great abuſes and trouble that afterwards were perceived to grow by it, was utterly taken away by ſtat. 14 Edw. III. c. 4.

ENGLESQUEVIL'LE, a town of France, in the department of the Lower Seine: fifteen miles ſouth-weſt of Arques.

EN'GLISH, *adj.* [engleſ, Sax.] Belonging to England; thence *Engliſh* is the language of England. See the article LANGUAGE.

EN'GLISH, *ſ.* [the adj. by ellipſis, for] The Engliſh language.—I can ſpeak *Engliſh*, lord, as well as you. *Shakeſpeare.*—There are in *Engliſh* twenty-ſix letters. *Lowth.*

To EN'GLISH, *v. a.* To tranſlate into Engliſh.—The hollow inſtrument terebra, we may *engliſh* piercer. *Bacon.*

EN'GLISH BANK, a remarkable ſhoal in the Indian Ocean, is ſituate in lat. 17. 56. N. and lon. 39. 3. E.

EN'GLISH BAR, an extenſive ſand-bank on the weſt coaſt of France, called by the French *la Barre Anglois*, which runs off for near a league from Point Terre Negree towards Point de la Coubre, which are the two points of a large bay that affords anchorage in five fathoms water. It is on the north coaſt of the river of Bourdeaux, and almoſt north from the tower of Cordovan.

EN'GLISH BAY, a ſpacious bay on the weſt coaſt of the gulf of Manar, in the Eaſt Indies, ſituated on the coaſt to the north-eaſt from Cape Comorin, or the ſouthern point of the peninſula of India. It is not far from the Dutch ſtation for carrying on the pearl fiſhery, and is formed by two points of land, projecting out in ſuch a manner as to ſhape a kind of baſon. Lat. 8. 45. N. lon. 76. 50. E.

EN'GLISH CHANNEL, all that ſpace of ſea which runs between the ſouth coaſt of England and the north coaſt of France, opening or entering from Uſhant to the Scilly Iſlands, which is called the *Chops of the Channel.*

EN'GLISH COVE, a harbour or bay, on the coaſt of New Ireland, about three or four miles from Cape St. George.

EN'GLISH COVE, a commodious bay in the iſland of Minorca, a little below the town of Mahon. It is the watering-place for the navy, where the harbour is nearly a mile over, which is almoſt the greateſt breadth of the harbour; and is about half a mile above Bloody Iſland, which is ſituated nearly in the middle of the channel.

EN'GLISH CREEK, a ſmall cove near the ſouth-eaſt part of the iſland of Martinico in the Weſt Indies, a little to the north-eaſt from Point Salines, or the moſt ſoutherly cape of the iſland.

EN'GLISH HARBOUR, a commodious bay of the river St. Lawrence, in North America, eight leagues weſt-by-ſouth from Trinity Point. Lat. 49. 29. N. lon. 67. 0. W.

EN'GLISH HARBOUR, a fiſhing cove near the extreme limit of the large and deep bay called Trinity Bay, on the eaſt coaſt of Newfoundland, and contiguous to Trinity Harbour.

EN'GLISH HARBOUR, a large bay on the north-weſt of Cape Raphael, on the eaſt part of St. Domingo or Hiſpaniola, in the Weſt Indies. On a rock near the entrance of this harbour the Scipion, of ſeventy-four guns, was loſt, in running for the harbour, after having had an engagement with the London, of ninety guns, in the month of October, 1782. Lat. 19. 8. N. lon. 68. 25. W.

EN'GLISH HARBOUR, a large bay on the ſouth coaſt of the iſland of Antigua, in the Weſt Indies, and the beſt port of the whole iſland. At a very great expence it has been rendered capable of receiving the largeſt ſhips

of

of war, and is provided with a dock-yard, and all the ſtores and materials neceſſary for repairing and careening veſſels.

EN'GLISH ISLANDS, ſmall iſlands ſituate on the ſouth point of Engliſh Creek, near the ſouth-eaſt part of the iſland of Martinico, in the Weſt Indies.

EN'GLISH MERCURY. See CHENOPODIUM.

EN'GLISH POINT, a cape in the river St. Lawrence, on the coaſt of Canada. Lat. 49. 40. N. lon. 61. 45. W. Greenwich.

EN'GLISH REACH, a reach in the Straits of Magellan, about three leagues over, between Cape Gallant and Cape Holland.

EN'GLISH ROAD, a road in the iſland of Eooa, or Middleburgh, in the South Pacific Ocean, with twenty-five fathoms water. Lat. 21. 20. S. lon. 174. 34. W. Greenwich.

EN'GLISH-TOWN, a town of the American States, in New Jerſey: ſix miles north-eaſt of Philadelphia, and eighteen eaſt of Prince-town.

ENGLOTTOGAS'TOR, *ſ.* [from εν, γλωτ̃η, Gr. the tongue, and γαστηρ, the belly.] One who ſpeaks from his belly; a ventriloquiſt.

EN'GLSTAIN, a town of Germany, in the archduchy of Auſtria: ſix miles north-weſt of Zwetl.

To ENGLU'T, *v. a.* [*engloutir*, Fr.] To ſwallow up. *It is now little uſed:*

How many prodigal bits have ſlaves and peaſants
This night *englutted!* *Shakeſpeare.*

To fill; to glut; to pamper.—Being once *englutted* with vanity, he will ſtraightway loath all learning. *Aſcham.*

To ENGLU'TE, *v. a.* [from *gluten*, Lat. glue.] To glue or faſten together.

ENGOMPHO'SIS, *ſ.* [from εν, and γομφος, Gr. a nail.] In anatomy that ſpecies of articulation which reſembles a nail driven into wood, as a tooth in its ſocket.

ENGO'NASIS, *ſ.* [εγγονασις, Gr. a bowing of the knee.] In aſtronomy, the ſame as Hercules, one of the northern conſtellations, ſo called from the figure of Hercules bearing upon his right knee, and endeavouring to bruiſe a dragon's head with his left foot. See HERCULES.

To ENGO'RE, *v. a.* To pierce; to prick. *Not uſed:*

As ſavage bull, whom two fierce maſtiffs bait,
When rancour doth with rage him once *engore*,
Forgets with wary ward them to await,
But with his dreadful horns them drives afore. *Spenſer.*

To ENGO'RGE, *v. a.* [from *gorge*, Fr. a throat.] To ſwallow; to devour; to gorge:

That is the gulf of greedineſs, they ſay,
That deep *engorgeth* all this world's prey. *Spenſer.*

To ENGO'RGE, *v. n.* To devour; to feed with eagerneſs and voracity; to riot:

Greedily ſhe *engorg'd* without reſtraint,
And knew not eating death! *Milton.*

To ENGRA'IL, *v. a.* [from *grele*, Fr. hail.] To variegate; to ſpot as with hail. A word now uſed only in heraldry, for to indent in curve lines.

To ENGRA'IN, *v. a.* To die deep; to die in grain:

See thou how freſh my flowers being ſpread,
Dyed in lilie white and crimſon red,
With leaves *engrain'd* in luſty green. *Spenſer.*

To ENGRAP'PLE, *v. a.* To cloſe with; to contend with hold on each other:

There ſhall young Hotſpur, with a fury led,
Engrapple with thy ſon, as fierce as he. *Daniel.*

To ENGRASP', *v. a.* To ſeize; to hold faſt in the hand; to gripe:

Now 'gan Pyrocles wax as wood as he,
And him affronted with impatient might;
And both together fierce *engraſped* be,
Whiles Guyon ſtanding by, their uncouth ſtrife doth ſee. *Spenſer.*

To ENGRA'VE, *v. a.* preter. *engraved*; part. paſſ. *engraved* or *engraven*; [*engraver*, Fr.] To picture by inciſions in any matter;

O'er all, the heav'n's refulgent image ſhines;
On either gate were fix *engraven* ſigns. *Addiſon.*

To mark wood or ſtone.—*Engrave* the two ſtones with the names. *Ex.* xxviii. 11.—To impreſs deeply; to imprint.—It will ſcarce ſeem poſſible, that God ſhould *engrave* principles, in men's minds, in words of uncertain ſignification. *Locke.*

Sounds which addreſs the ear, are loſt and die
In one ſhort hour; but that which ſtrikes the eye,
Lives long upon the mind: the faithful ſight
Engraves the knowledge with a beam of light. *Watts.*

[from *grave.*] To bury; to inhume; to inter:

The ſon had charge of them, now being dead,
In ſeemly ſort their corſes to *engrave*,
And deck with dainty flowers their bridal bed. *Spenſer.*

ENGRA'VER, *ſ.* A cutter in ſtone or other matter. It is univerſally applied to thoſe artiſts who engrave copper-plates for books and prints, &c.—Images are not made in the brain itſelf, as the pencil of a painter or *engraver* makes the images in the table, but are imprinted in a wonderful method in the ſoul. *Hale.*

ENGRAVING, *ſ.* The art of forming any device, figure, picture, ornament, or writing, by ſinking or cutting the ſame on metal, wood, ſtone, glaſs, &c. whereby prints or impreſſions may be taken, and multiplied at pleaſure. It is, ſtrictly ſpeaking, a branch of ſculpture. Among the elegant arts engraving copper-plates has at length arrived at ſuch a degree of perfection, and contributes ſo much to the rational amuſement of cultivated life, that eminent engravers have the faireſt claim to be honourably recorded in the faithful page of biography. This reward, not unfrequently the only one obtained by genius, ought ſo much the rather to be beſtowed, as it frequently operates as an encouragement to the young artiſt, and inſpires him with that glow of ambition, without which no maſterpiece was ever accompliſhed. Indeed, when the anxious ſtudent ſees with how much veneration great artiſts and their productions are mentioned, the importance of the art will neceſſarily riſe in his opinion. When he conſiders with what perſeverance the moſt eminent engravers have toiled till they arrived at the ſummit of the art; and that the moſt fatiguing labour, the moſt formidable obſtacles, and the moſt depreſſing poverty, have operated only as a ſtimulus to employ every expedient for obtaining their great end: theſe reflections will not fail to rouſe and ſtimulate him, and induce him to take advantage of every hour in the day, and devote every minute of his time to exertion! In the ſame manner, the inſtances of adverſe fortune, under which more than one great maſter have laboured, may ſerve as wholeſome advice to him, and ſhew how eſſential it is to add morality and prudence to genius and talents, in order to procure ſolid happineſs by the ſucceſsful practice of ſo honourable a profeſſion. And, let it be remembered by thoſe who, not much to the credit of their diſcernment, affect to rail at virtuoſi, that nothing is better calculated to form our taſte than the ſtudy of good engravings. They pleaſingly introduce us to the fine arts, and pave the way for a knowledge of pictures; if examined attentively, they ſoon teach the beholder to diſcover the peculiar manner of each particular maſter and ſchool; and they give us an idea, and put us, as it were, in poſſeſſion of an infinite number of paintings, which we could not have acquired without the aid of immenſe ſums of money. Beſides theſe effects, which are general, every one may derive from this branch of the arts individual advantages, according to the extent of his taſte, attainments, and inclination. Every perſon, of whatſoever profeſſion, may deduce great benefit and inſtruction from engravings; which, ever ſince their invention, have been copied and

multiplied from ſuch a variety of objects, that nearly all neceſſary information reſpecting the form and conſtruction of the remoteſt and moſt complicated things, may be acquired by their aſſiſtance.

From the facility with which copper-plate impreſſions are multiplied, prints have derived an advantage over paintings by no means inconſiderable. They are found to be more durable; which, however, muſt be attributed to the different methods in which they are preſerved. Many of the beſt-paintings of the early maſters have generally had the misfortune to be either painted on walls, or depoſited in large and unfrequented, and conſequently damp and deſtructive, buildings; whilſt a print, paſſing, at diſtant intervals, from the *porte feuille* of one collector to that of another, is preſerved without any great exertion of its owner: and hence it happens, that whilſt the pictures of Raphael have mouldered from their walls, or deſerted their canvas, the prints of his friend and cotemporary Mark Antonio Raimondi continue in full perfection to this day, and give us a lively idea of the beauties of thoſe paintings, which without their aſſiſtance, had been loſt to us for ever; or at leaſt, could have been only known to us, like thoſe of Zeuxis and Apelles, by the deſcriptions which former writers on theſe ſubjects have left us. Independent of the advantages which prints afford us, when conſidered as accurate repreſentations of paintings, and imitations of ſuperior productions, they are no leſs valuable for their poſitive merit, as immediate repreſentations of nature. For it muſt be recollected, that the art of engraving has not always been confined to the copying other productions, but has frequently itſelf aſpired to originality, and has, in this light, produced more inſtances of its excellence than in the other. Albert Durer, Goltzius, and Rembrandt, amongſt the Dutch and Germans; Parmegiano and Della Bella amongſt the Italians, and Callot amongſt the French, have publiſhed many prints, the ſubjects of which, there is great reaſon to ſuppoſe, were never painted. Theſe prints may therefore be conſidered as original pictures of thoſe maſters, deficient only in thoſe particulars in which a print muſt ever neceſſarily be inferior to a painting.

The art of engraving on copper appears comparatively to be only a modern invention, having had its riſe no earlier than about the commencement of the 15th century. The ancients, it is true, practiſed engraving on precious ſtones and cryſtals, called *gems*, with very good ſucceſs; and there are ſtill many of their works remaining equal to any production of the later ages. See the article EGYPT, p. 374, of this volume. But the art of engraving on plates and blocks of wood, to afford prints or impreſſions, was not known till very long after the invention of painting in oil.

The different modes of engraving are the following: In ſtrokes cut through a thin wax, laid upon the copper, with a needle; and theſe ſtrokes bitten or corroded into the copper with aquafortis; called *etching*. In ſtrokes with the graver alone, unaſſiſted by aquafortis. In this the deſign is traced with a ſharp tool, called a *dry point*, upon the plate; and the ſtrokes are cut upon the copper with the inſtrument called a *graver*. In ſtrokes firſt etched, and afterwards finiſhed with the graver: by this expedient the two former methods are united. In dots without ſtrokes, which are executed with the point upon the wax or ground, bitten in with the aquafortis, and afterwards harmonized with the graver. In mezzotinto, which is performed by a dark ground being raiſed uniformly upon the plate with a barbed tool. The deſign being traced upon the plate, the light parts are ſcraped off by inſtruments for that purpoſe, in proportion as the effect requires. In aquatinta, where the outline is firſt etched, and afterwards a ſort of waſh is laid by the aquafortis upon the plate, reſembling drawings in Indian ink, &c. On wood, performed with a ſingle block, on which the deſign is traced with a pen, and thoſe parts which ſhould be white carefully hollowed out; and this block is afterwards printed by the letter-preſs printers, in the ſame manner as they print a book. On wood, performed with two, three, or more, blocks; the firſt having the outlines cut upon it; the ſecond is reſerved for the darker ſhadows; and the third for the ſhadows which terminate upon the lights; and theſe are ſubſtituted in their turn, each print receiving an impreſſion from every block. This mode of engraving is called *chiaro ſcuro*, and was deſigned to repreſent the drawings of the old maſters.

Of all theſe modes of engraving, for the purpoſe of giving impreſſions on paper, the moſt ancient is that on *wood*. It appears that we are indebted to the makers of playing cards for this invention, who practiſed the art in Germany prior to the 15th century. From that time it continued in an improving ſtate; and towards the end of the 15th, and beginning of the 16th century, it became cuſtomary for almoſt every one of the German engravers on copper to engrave on wood alſo. The works of Albert Durer and Holbein, in this ſtyle of engraving, are juſtly held in the higheſt eſteem. Italy, France, and Holland, have produced many capital artiſts of this kind; but for boldneſs and ſpirit, we muſt prefer the prints of Chriſtopher Jegher, who worked under the direction of Rubens, and was without doubt aſſiſted by that great maſter.

The invention of that ſpecies of engraving diſtinguiſhed by the appellation of *chiaro-ſcuro*, ſeems alſo to be juſtly claimed by the Germans, and was firſt practiſed by Mair; one of whoſe prints of this kind is dated 1499. Many excellent works in chiaro-ſcuro have been produced in France; and in Italy it was honoured with the performances of Titian and Parmegiano. To this invention of cutting or engraving blocks of wood, we are indebted for the devices and ornaments on paper-hangings, and printed cottons and chintz.

In Germany, about the year 1450, prints from engraved *copper* firſt made their appearance. The earlieſt date hitherto found on a copperplate print, is 1461; but however faulty this print may be with reſpect to the drawing, or defective in point of taſte, the mechanical part of the execution of it has by no means the appearance of being one of the *firſt* productions of the graver. We have alſo ſeveral other engravings, evidently the work of the ſame maſter; in which the impreſſions are ſo neatly taken from the plates, and the engravings ſo clearly printed in every part, that, according to all appearance, they could not be executed in a much better manner in the preſent day, with all the conveniences which the copperplate printers now poſſeſs, and the additional knowledge they muſt neceſſarily have acquired in the courſe of more than three centuries. Hence we may fairly conclude, that if they were not the firſt ſpecimens of the engraver's workmanſhip, they were much leſs the firſt efforts of the copper-plate printer's ability. The earlieſt prints that are known to be Italian, are a ſet of the ſeven planets, and an almanack by way of frontiſpiece; on which are directions for finding Eaſter from the year 1465 to 1517 inclusive. The three earlieſt *Italian* engravers are, Finiguerra, Boticelli, and Baldini.

With reſpect to the invention of *etching*, it ſeems to be not well known to whom it is to be aſcribed. One of the moſt early ſpecimens is of a print by Albert Durer, known by the name of the *Cannon*, dated 1518. Another etching by the ſame artiſt is Moſes receiving the Tables of the Law, dated 1524. It was alſo practiſed in Italy ſoon after this by Parmegiano, in whoſe etchings we diſcover the hand of the artiſt working out a ſyſtem as it were entirely from his own imagination. We ſee plainly the difficulty he laboured under; and cannot doubt, from the examination of the mechanical part of the execution, that he had no inſtruction; and that it was an operation quite new to him. As to that ſpecies of engraving in which the *etching* and *cutting* with the graver are united, it muſt have taken place immediately upon the invention of etching; it was, however, firſt carried to perfection by G. Audran,

G. Audran, and is now almoſt univerſally practiſed, whether the work be in ſtrokes or in dots.

Engraving in *dots*, now ſo highly improved under the name of *ſtibbling*, or *chalk*, is a very old invention, and the only mode diſcovered by the Italians. Agoſtino de Muſis, commonly called *Auguſtine of Venice*, a pupil of Marc Antonio, uſed it in ſeveral of his earlieſt works, but confined it to the fleſh. He flouriſhed from 1509 to 1536. We alſo find it in a print by Giulio Campagnola, about the year 1516. The back ground is executed with round dots, made apparently with a dry point.

In the conduct of the graver and dry point, conſiſts all the excellence of this valuable art; for which there are no rules to be given; all depending on the habitude, diſpoſition, and genius, of the artiſt. However, as the principles of engraving are the ſame with thoſe of painting, a perſon cannot expect to attain any conſiderable degree of eminence, who is not a good maſter of deſign; and therefore he ought to be well acquainted with perſpective and architecture: the former, by the proper gradations of ſtrong and faint colours, will enable him to throw backwards the figures and other objects of the picture or deſign which he propoſes to imitate; and the latter will teach him to preſerve the due proportion of its ſeveral orders, which the painter often entruſts to the diſcretion of the engraver. In order to preſerve equality and union in his works, the engraver ſhould always ſketch out the principal objects of his piece before he undertakes to finiſh them. In working, the ſtrokes of the graver ſhould never be croſſed too much in a lozenge manner, particularly in the repreſentation of fleſh, becauſe ſharp angles produce the unpleaſing effect of lattice-work, and take from the eye the repoſe which is agreeable to it in all kinds of picturеſque deſigns: we ſhould except the caſe of clouds, tempeſts, waves of the ſea, the ſkins of hairy animals, or the leaves of trees, where this method of croſſing may be admitted. But in avoiding the lozenge, it is not proper to get entirely into the ſquare, which would give too much of the hardneſs of ſtone. In conducting the ſtrokes, the action of the figures, and of all their parts, ſhould be conſidered; and it ſhould be obſerved how they advance towards, or recede from, the eye; and the graver ſhould be guided according to the riſings or cavities of the muſcles or folds, making the ſtrokes wider and fainter in the light, and cloſer and firmer in the ſhades. Thus the figures will not appear jagged; and the hand ſhould be lightened in ſuch a manner, that the outlines may be formed and terminated without being cut too hard; however, though the ſtrokes break off where the muſcle begins, yet they ought always to have a certain connection with each other, ſo that the firſt ſtroke may often ſerve by its return to make the ſecond, which will ſhow the freedom of the engraver. But to excel in producing a powerful imitation of fleſh, and in giving a ſoft and delicate turn to the muſcular fibre, it is neceſſary that the artiſt ſhould cloſely ſtudy the ſtructure of the human body; and in order to give energy and true character to ſtill life, he ſhould ſtudy the general phyſiology of man and animals.

ETCHING, or the artifice of working with aquafortis, has been of late ſo much improved, that inſtead of being now deemed a coarſe or ſpurious kind of engraving, it evidently appears the foundation of an excellence in many modern works, that could never have been produced without it. There are two methods practiſed of engraving in this way; the one with a hard varniſh or ground, the other with a ſoft. The firſt was formerly much uſed, being better accommodated to the intention of imitating the engraving with the tool; as the firmneſs of the body of the varniſh gave more opportunity of retouching the lines, or enlarging them with the oval-pointed needles, called by the French *echoppes*, as was practiſed by Le Boſſe and others for that purpoſe. The latter has now almoſt wholly ſuperſeded the uſe of the other, by the free manner of working it admits of; which affords a power of expreſſion incompatible with the greater inflexibility of the hard varniſh, that confines the lines and hatches to ſuch a regularity and ſameneſs, as gives a ſtiffneſs of manner and coldneſs of effect to the work.

The mixture of the uſe of the tool and aquafortis, which are thus both employed, has obviouſly given that perfection to engraving which it poſſeſſes at preſent. The truth and ſpirit of the outline that the method of working with aquafortis affords, and the variety of ſhades produced in this way, as well as other means of expreſſing the peculiar appearance and character of particular ſubjects, furniſh what was defective in the ſole uſe of the tool; while, on the other hand, the exactneſs and regularity of the lines, which are required for finiſhing many kinds of deſigns, are ſupplied by the graver; and by a judicious application of both, that complete finiſhing is obtained, which either of them alone would neceſſarily want.

The manner by which this art is performed, is the covering the ſurface of the plate with a proper varniſh or ground, as it is called, which is capable of reſiſting aquafortis; and then ſcoring or ſcraping away, by inſtruments reſembling needles, the parts of this varniſh or ground, in the places where the ſtrokes or hatches of the engraving are intended to be: then, the plate being covered with aquafortis, the parts that are laid naked and expoſed by removing the ground or varniſh, are corroded or eaten away by it; while the reſt, being ſecured and defended, remain untouched. But the varniſh ought always to be harder in ſummer than in winter. For the moſt approved kinds, ſee the article VARNISH.

The plate being thus prepared, and an exact drawing of the outlines of the deſign made upon thin paper, the other ſide of the paper muſt be rubbed over with red chalk ſcraped to a powder; and the looſe chalk cleared off with a linen rag: then the ſtained ſide of the paper is laid upon the varniſh, fixing the corners to the plate with wax or wafers, to prevent its moving; and with a blunted needle or point the drawing is ſlightly traced, and communicates to the varniſh an exact outline of the deſign to be etched. If any ſcratches or falſe ſtrokes happen in the working, they are to be ſtopped up with a hair-pencil dipped in Venetian varniſh, mixed with lamb-black, by which means theſe places will be defended from the action of the aquafortis. The next operation is to make a border of ſoft wax round the plate about an inch high, to contain the aquafortis. At one of the corners of this border a gutter is uſually made, which ſerves for pouring the aquafortis off the plate. The plate being thus bordered, the *etching* is to be made as follows: Take a due quantity of the refiners aquafortis; mix it with half its quantity of common water; and pour it gently on, till it riſe above a finger's breadth above the ſurface of the plate; when, if all things have been rightly conducted, it will be ſeen that the aquafortis will ſoon exert its action in the hatches or parts which have been ſtrongly touched; but thoſe more weakly engraved will appear at firſt clear, and of the colour of the copper. The menſtruum muſt therefore be ſuffered to continue on the plate till its effects become viſible on the more tender parts: then the aquafortis ſhould be poured off, the plate waſhed with clean water, and dried before the fire: then take a ſmall pencil dipped into the Venetian varniſh, and cover with it the lighter parts of the plate. This being done, the aquafortis muſt again be poured on, and ſuffered to continue a longer or ſhorter time, according to the ſtrength of the menſtruum, or the nature of the engraving; when it muſt be again poured off as before, and the plate immediately waſhed with water. It may not be improper to obſerve, that, when the aquafortis is on the plate, a feather ſhould be uſed to cleanſe away the foulneſs of the verdigris that gathers in the hatches when the aquafortis operates on them, and to give it more room to exert its action; for by moving the aquafortis to and fro on the plate by the feather, and bruſhing away the black ſaline matter

matter where it appears to be formed, the hatches will be cleanſed and the aquafortis exert its whole force equally on every part. The border of wax is then to be removed, the plate waſhed, and rubbed over with oil of olives; after which a more elegant finiſh is given with the graver.

The art of engraving in MEZZOTINTO is calculated to form prints in imitation of drawings in Indian ink. The invention has been uſually attributed to prince Rupert. But baron Heinikin aſſerts, with great appearance of truth, that it was lieutenant-colonel de Siegan, an officer in the ſervice of the landgrave of Heſſe, who firſt engraved in this manner; and that the print which he produced was a portrait of the princeſs Amelia Elizabeth of Heſſe, engraved in 1643. Prince Rupert learned the ſecret from this gentleman, and brought it into England when he came over the ſecond time with Charles II. Prince Rupert's print of an executioner holding a ſword in one hand and a head in the other, from Spagnoletto, is dated 1658. It is remarkable that this art has never been cultivated with ſucceſs in any country but England.

This method is very different from the common way of engraving. To perform it, they rake, hatch, or line, the ſurface of the plate all over with a knife, or inſtrument made for the purpoſe, firſt one way, then the other, acroſs, &c. till the ſurface of the plate be thus entirely covered with lines or furrows, cloſe to each other; ſo that, if an impreſſion was then taken from it, it would be one uniform patch of ſmut. This done, the deſign is drawn or marked on the ſame ſurface; after which, they proceed with burniſhers, ſcrapers, &c. to expunge the dents or furrows, in all the parts where the lights of the piece are to be; leaving thoſe parts black which are to repreſent the dark ſhadows of the draught. As it is much eaſier to ſcrape or burniſh away parts of a dark ground correſponding with the outline of any deſign ſketched upon it, than to form ſhades upon a light ground by an infinite number of hatches, ſtrokes, and points, which muſt all terminate with exactneſs on the outline, as well as differ in their force and manner; the method of *ſcraping*, as it is called, in mezzotinto, conſequently becomes much more eaſy and expeditious than any other method of engraving. The inſtruments uſed in this work are cradles, ſcrapers, and burniſhers.

In this engraving, the plate muſt be prepared and poliſhed in the ſame manner as for other engraving; and afterwards divided equally by lines parallel to each other, and traced out with very ſoft chalk. The diſtance of theſe lines ſhould be about one-third of the length of the face of the cradle which is to be uſed, and theſe lines ſhould be marked with capital letters, or ſtrokes of the chalk. The cradle is then to be placed exactly betwixt the two firſt lines, and paſſed forwards in the ſame direction; being kept as ſteady as poſſible, and preſſed upon with a moderate force. The ſame operation muſt be repeated with reſpect to all the other lines; till the inſtrument has thus paſſed over the whole ſurface of the plate. Other lines muſt be then drawn from the extremities of the other two ſides, in the ſame manner; which, interſecting the firſt at right angles, will with them form ſquares; and the ſame operation muſt be repeated with the cradle as in the caſe of the firſt. New lines muſt then be drawn diagonally, and the cradle paſſed betwixt them as before; and when the firſt diagonal operation is performed, the lines muſt be croſſed at right angles as the former, and the cradles paſſed betwixt them in the ſame manner. The plate having undergone the action of the cradle, according to the diſpoſition of the firſt order of lines, a ſecond ſet muſt be formed, having the ſame diſtances from each other as the firſt. But they muſt be ſo placed as to divide thoſe already made into ſpaces one-third leſs than their whole extent; *i. e.* every one after the firſt on each ſide will take in one-third of that before it, *e. g.* beginning at A, of which the firſt third muſt be left out; a third of B will conſequently be taken in, and ſo of the reſt. Theſe lines of the ſecond order muſt be marked with ſmall letters, or leſſer ſtrokes, to diſtinguiſh them from the firſt: and the ſame treatment of the plate muſt be purſued with reſpect to them as was practiſed for the others. When this ſecond operation is finiſhed, a third order of lines muſt be made; the firſt of which, *e. g.* in A, muſt omit two-thirds of it, and conſequently take in two-thirds of B, &c. By theſe means, the original ſpaces will be exactly divided into equal thirds; and the cradle muſt be again employed betwixt theſe lines as before. When the whole of this operation is finiſhed, it is called *one turn*; but in order to produce a very dark and uniform ground, the plate muſt undergo the repetition of all theſe ſeveral operations for above twenty times; beginning to paſs the cradle again betwixt the firſt lines, and proceeding in the ſame manner through all the reſt. When the plate is prepared with a proper ground, the ſketch muſt be chalked on it, by rubbing the paper on the backſide with chalk. It is alſo proper to overtrace it afterwards with black lead or Indian ink. The ſcraping is then performed, by paring or cutting away the grain of the ground in various degrees; ſo that none of it is left in the original ſtate except in the touches of the ſtrongeſt ſhade. The general manner of proceeding is the ſame as drawing with white upon black paper. The maſſes of light are firſt begun with; and thoſe parts which go off into light in their upper part, but are brown below: the reflections are then entered upon; after which the plate is blackened with a printer's blacking-ball made of felt, in order to diſcover the effect: and then the work is proceeded with; obſerving always to begin every part in the places where the ſtrongeſt lights are to be.

The art of ſcraping mezzotintoes has been applied to the printing with a variety of colours, in order to produce the reſemblance of paintings. The inventor of the method of doing this was J. C. Le Blon, a native of Frankfort, and pupil of Carlo Maratta, between the years 1720 and 1730. It was eſtabliſhed by the inventor on this principle, that there are three primitive colours, of which all the reſt may be compoſed by mixing them in various proportions; and that three plates were neceſſary, exactly of the ſame kind, to impreſs the three colours, by laying one over the other, the laſt of which was to be charged with the brighteſt tints. Modern improvement has, however, ſuperſeded this tedious method, and the colours are now all laid upon one plate, which gives the impreſſion at once in a very correct and beautiful manner, and is called *printing in colours*.

Engraving in *Aquatinta*, is of a very modern date, and is admirably calculated for landſcape, coſtume, and other light ſubjects. See the method deſcribed under AQUATINTA, vol. i. p. 840.

Thoſe who ſhall invent, deſign, and engrave, prints, are to have the ſole right of printing them for fourteen years, but which ſhall be engraved with the names of the proprietors; and others copying, and ſelling ſuch prints, though by varying, &c. without their conſent, ſhall forfeit five pounds for every print, and alſo the plates and impreſſions. 8 *Geo.* II. c. 13.

The art of engraving on precious ſtones or gems, called *pietrè durè*, is one of thoſe wherein the ancients excelled; there being many antique agates, cornelians, and onyxes, which greatly ſurpaſs any thing of that kind produced by the moderns. Prygoteles among the Greeks, and Dioſcorides under the firſt emperors of Rome, are the moſt eminent of theſe engravers recorded in hiſtory: the former was ſo eſteemed by Alexander, that he forbad any body elſe to engrave his head; and Auguſtus's head, engraved by the latter, was deemed ſo beautiful, that the ſucceeding emperors choſe it for their ſeal. The polite arts having been buried under the ruins of the Roman empire, the art of engraving on gems met with the ſame fate. It was retrieved in Italy at the beginning of the fifteenth century, when John of Florence, and after him Dominic of Milan, performed works of this kind no way to be

deſpiſed.

deſpiſed. From that time, ſuch ſculptures and ſeals became common in Europe, and particularly in Germany, whence great numbers were ſent into other countries: but they were far ſhort of the beauty of thoſe of the ancients. The number of engraved gems has been ſo great, that the collection made by Mr. Taſſie, in Leiceſter-ſquare, London, alone occupies two large quarto volumes, in the mere recital.

The diamond, which is the hardeſt of all gems, is only cut by itſelf, or with its own matter. The firſt thing in this branch of engraving is, to cement two rough diamonds to the ends of two ſticks big enough to hold them ſteady in the hand, and to rub or grind them againſt each other till they be brought to the form deſired. The duſt or powder that is rubbed off ſerves afterwards to poliſh them, which is performed with a kind of mill that turns a wheel of ſoft iron. The diamond is fixed in a braſs diſh; and, thus applied to the wheel, is covered with diamond duſt, mixed up with oil of olives. Rubies, ſapphires, and topazes, are cut and formed the ſame way on a copper wheel, and poliſhed with tripoli diluted in water. Agates, amethyſts, emeralds, hyacinths, granites, rubies, and others of the ſofter ſtones, are cut on a leaden wheel, moiſtened with emery and water, and poliſhed with tripoli on a pewter wheel. Lapis-lazuli, opal, &c. are poliſhed on a wooden wheel. To faſhion and engrave vaſes of agate, cryſtal, lapis-lazuli, &c. they make uſe of a kind of lathe, like that uſed by pewterers, to hold the veſſels, which are to be wrought with proper tools: that of the engraver generally holds the tools, which are turned by a wheel; and a veſſel is held to them to be cut and engraved, either in relievo or otherwiſe; the tools being moiſtened from time to time with diamond duſt and oil, or with emery and water. To engrave figures or devices on any of theſe ſtones, when poliſhed, ſuch as medals, ſeals, &c. they uſe a little iron wheel, the ends of whoſe axis are received within two pieces of iron, placed upright, as in the turner's lathe; and to be brought cloſer, or ſet further apart, at pleaſure; at one end of the axis are fitted the proper tools, being kept tight by a ſcrew. The wheel is turned by the foot, and the ſtone applied by the hand to the tool, and is ſhifted and conducted as occaſion requires.

The art of engraving upon glaſs appears to be no new diſcovery. It is certain that the ancient Greek artiſts formed upon glaſs, both raiſed and engraved figures; as may be ſeen by articles ſtill preſerved in collections, though it is probable that many pieces of glaſs may have been moulded like paſte; for that art alſo is of very great antiquity. It appears likewiſe that they cut upon plates of glaſs and hollow glaſs veſſels all kinds of figures and ornaments, in the ſame manner as names, coats of arms, flowers, landſcapes, &c. are cut upon drinking-glaſſes at preſent. If we can believe that learned engraver in ſtone, the celebrated Natter, the ancients employed the ſame kind of inſtruments for this purpoſe as thoſe uſed by the moderns. They undoubtedly had in like manner a wheel which moved round in a horizontal direction above the work-table, or that machine which by writers is called a lapidary's wheel.

Many, however, affirm, that the art of glaſs-cutting, together with the neceſſary inſtruments, was firſt invented in the beginning of the ſeventeenth century. The inventor is ſaid to have been Caſpar Lehmann, who originally was a cutter of ſteel and iron; and who made an attempt, which ſucceeded, of cutting cryſtal, and afterwards glaſs, in the like manner. He was in the ſervice of the emperor Rodolphus II. who, in 1609, conferred on him the title of lapidary and glaſs-cutter to the court, and gave him a patent by which every one except himſelf was forbidden to exerciſe this new art. He worked at Prague, where he had an aſſiſtant named Zacharias Belzer; but George Schwanhard the elder, one of his ſcholars, carried on the ſame buſineſs to a far greater extent. The latter, in 1618, went to Prague to learn the art of glaſs-cutting from Lehmann. By his good behaviour he ſo much gained the eſteem of his maſter, who died a bachelor in 1622, that he was left his heir; and obtained from the emperor Rodolphus a continuation of Lehmann's patent. Schwanhard, however, removed to Nuremberg, where he worked for many of the principal nobility; and by theſe means procured to that city the honour of being accounted the birth-place of this new art. That engraving on glaſs is of ſo modern a date, is alſo attempted to be confirmed by Zahn, who ſpeaks of it as of a new employment carried on, at that time, particularly at Nuremberg. He deſcribes the work-table, as well as the other inſtruments; and gives a figure of the whole, which he appears to have conſidered as the firſt. It may be ſeen, however, that this invention does not belong entirely to the moderns; and, to deny that the ancients were altogether unacquainted with it, would be doing them an injuſtice. It was forgotten, and again revived; which is proved by count Caylus. Before this invention, with a wheel, there were artiſts who, with a diamond, engraved figures on glaſs, which were every where admired. The firſt mention of a diamond being uſed among the moderns for cutting or writing on glaſs, occurs in the ſixteenth century. Francis I. of France, who was fond of the arts, wrote the following lines with his diamond ring upon a pane of glaſs, at the caſtle of Chambord, in order to let Anne de Piſſeleu, ducheſs of Eſtampes, know that he was jealous:

Souvent femme varie,
Mal habil qui s'y fie.

Put no truſt in womankind;
Fickle as the waves and wind.

The hiſtorian recorded this not ſo much on account of the admonition, as becauſe it was then thought very ingenious to write upon glaſs. About the year 1562, feſtoons and other ornaments, cut with a diamond, were extremely common on Venetian glaſſes, which, at that period, were accounted the beſt. George Schwanhard the elder was a great maſter in this art; and, in more modern times, John Koſt, an artiſt of Augſburg, ornamented, in a very curious manner with a diamond pencil, ſome drinking-glaſſes which were purchaſed by the emperor Charles VI.

The art of *etching* on glaſs, ſaid to have been firſt diſcovered in 1771 by Scheele the chemiſt, can be proved to have been in uſe ſo early as the year 1670, by the beforementioned artiſt, Henry Schwanhard. We are told, that ſome aqua regia having fallen by accident upon his ſpectacles, the glaſs was corroded by it; and that he thence learned to make a liquid by which he could etch writing, and figures of men, animals, plants, and flowers, upon plates of glaſs. It is very probable that his preparation was the ſame as that known to ſome artiſts as a ſecret in 1721.

The preſent mode of etching on glaſs is as follows: the plate or veſſel of glaſs is to be completely covered with melted wax or maſtic; and when the coating becomes hard, it is to be engraved upon by a very ſharp-pointed needle or other inſtrument of that kind, as in common etching. A mixture of oil of vitriol and fluor acid is then to be poured upon the plate, and the whole covered with an inverted China veſſel, to prevent the evaporation of the fluor acid. In two days the glaſs plate may be cleared of its coating, when all the traces of the needle will be found eaten in, or etched upon it. Thus by the action of the fluor acid, a ſkilful artiſt can engrave upon the hardeſt glaſs, in the ſame manner as he can engrave upon copper with aquafortis.—In the "Memoirs of the National Inſtitute at Paris," publiſhed in 1802, a favourable report was made by the preſident Camus, of ſome attempts to ſubſtitute prepared plates of glaſs for engravings, inſtead of thoſe of planiſhed copper. The proceſs is yet in its infancy: but the Inſtitute entertain ſanguine hopes of its being ſpeedily brought to maturity. The ſuperiority of the one ſubſtance over the other, if it can

be made to reſiſt the requiſite preſſure of the rolling-preſs, is too obvious to need being ſtated:—the plate would not wear out, and it would paſs to poſterity unaffected by ruſt or canker, while each impreſſion would be equally good.

The manufacturing of veſſels with engraved ornaments of every kind, upon ſolid ſparry fluor, was begun in Derbyſhire, in 1765. The articles formed of it are called ſpar ornaments, and ſometimes blue-john. Many beautiful colours are produced; and the diſcovery has at once afforded a valuable acquiſition to our commerce, and an elegant addition to the equipage of the table.

ENGRAVING on STEEL is chiefly employed in cutting ſeals, punches, matrices, and dyes, proper for ſtriking coins, medals, and counters. The method of engraving with the inſtruments, &c. is the ſame for coins as for medals and counters: all the difference conſiſts in their greater or leſs relievo; the relievo of coins being much leſs conſiderable than that of medals, and that of counters ſtill leſs than that of coins. Engravers in ſteel commonly begin with punches, which are in relievo, and ſerve for making the creux or cavities of the matrices and dyes. The firſt thing done, is that of deſigning the figures; the next is the moulding them in wax, of the ſize and depth they are to lie, and from this wax the punch is engraved. When the punch is finiſhed, it receives a very high temper, that it may the better bear the blow of the hammer with which it is ſtruck, to give the impreſſion to the matrice. The ſteel is made hot to ſoften it, that it may the more readily take the impreſſion of the punch; and after ſtriking the punch on it in this ſtate, they proceed to touch up or finiſh any thing defective, with ſteel gravers of different kinds. For many purpoſes of an inferior kind, ſuch as the engravings or chaſings on the ornaments of coaches and coach-harneſs, &c. an ingenious method has been invented by Mr. James Yates, of Bordſley near Birmingham; for which, in 1788, he obtained a patent. The deſign is firſt engraved on a ſolid block of ſteel, made to the form or ſize required. It is then fixed in a die, which has a ring or collar round it, ſo as to form a kind of diſh, the ring on the outſide of it riſing higher than the engraved block; a forcer or block of metal is then impreſſed upon the engraving, and, with thin plates of ſoft tin, or lead, or mixed metal, is laid under a ſtamp or preſs, by the force of which a perfect impreſſion is ſtruck from the engraved block. Thin plates of gold, ſilver, plated metal, copper, braſs, or other mixed metals, are thus impreſſed, or ſtamped, and the raiſed ſide of the impreſſion of the engraving is then filled with melted lead, tin, or any other hard cement, to any thickneſs required; ſo that the reverſe ſide has the perfect appearance of the original engraved block. For ſome purpoſes, as ſteel, iron, or other metal roll is engraved, of any deſign required, and an impreſſion taken off, by another counter roll; and thus plates of thin metal, of any kind, are paſſed between the rollers, by the force of a mill, and the raiſed ſide of the impreſſion is afterwards filled with cement, as before deſcribed.

An ingenious method of engraving in oil, and multiplying copies on paper, parchment, linen, or other materials of a flexible texture, has been lately invented by Mr. Samuel Foplis, of Gainſborough. His method is as follows: Prepare a copper, braſs, or other metal plate, well poliſhed; or a piece of ſmooth glazed earthen ware; or a board, previouſly coated with copal, ſhell-lac, or any other hard varniſh: have alſo ready a cuſhion, made of the ſofteſt kind of leather, ſtuffed with wool, or other convenient article. On the cuſhion, ſpread a fine coat of ſtrong printing-ink; or, if that cannot be eaſily procured, uſe paint of any colour, or other ſubſtance of a viſcous nature, of ſuch a conſiſtence as will admit of a ſeparation without running. Take the plate, of whatever ſort, (holding it by the corners alternately,) and ſuffer it to touch the ink, paint, &c. by a gentle compreſſion of the plate, till the whole becomes coated. With a piece of pointed wood, or even a common ſkewer, reduced to a point fit for making proper ſtrokes, write, engrave, or delineate, the ſubject intended; either backwards or forwards, holding a flat ruler in one hand, as a guide, and to prevent injuring the coating while the operation is performing with the other. The plate thus prepared, muſt be taken to a common rolling-preſs, or any other kind of preſs, or, for want of them, placed on a hard piece of ground, or a boarded floor. On the plate lay a moiſt ſheet of paper, ſkin of parchment or leather, piece of ſilk, linen, or other material of flexible texture; on theſe lay a woollen cloth, or piece of blanket, and on that a proper ſized board, flat ſtone, or other ſuch body, giving the required preſſure by your own weight, or by any other effort of art or ſtrength; there will then be found a fair copy of all matters written, engraved, or delineated, on the coated plate, appearing on the paper, &c. in white letters or characters. If more than one copy is required, by this ſimple yet effectual method, the force meant to be applied to the written or engraved plate muſt be divided by the number of copies wanted; three, if not four, are to be had this way, and perhaps a greater number may be obtained by more general practice and experience.

As a diſtinct as well as new branch of the polite and liberal arts, engraving and writing in oil and oil colours may alſo be applied to glaſs, and to earthen ware in general, with peculiar advantage and neatneſs, according to the abilities and genius of the engraver; for which purpoſe the following rule is given, viz. If the letters, devices, ciphers, or other ſignatures, are deſired to be of a colour oppoſite to that of the natural body or ground colour of the veſſel, lay a coat of paint or varniſh upon it; let it become dry or hard, and write or engrave in the ſecond, third, &c. coat: but, if the ground-colour of the veſſel be preferred, one coat, in general, will be found ſufficient, and will be of conſiderable uſe. Moreover, this invention, may ſerve to convey uſeful knowledge, or the delineations of fancy, to the various parts of the habitable globe, in a different and more curious manner than by any other means that have hitherto been practiſed or attempted; as the art may be extended, through the mediums of painting, japanning, calico-printing, &c. to all bodies poſſeſſing plain ſurfaces, of whatever ſhape or uſe, amid our various arts and manufactures; for, amongſt other advantages that will certainly ariſe from it, is the very obvious one of being able to figure that eſſential part of dreſs, printed linens or cottons, in a cheaper and readier way than by any yet adopted. A ſmall thin plate of iron, braſs, &c. will be found extremely uſeful, with paint, or any other ſtaining ſubſtance of a glutinous and drying nature; and an advantage with regard to time, and other important conſiderations, will undoubtedly ariſe from its uſe.

To ENGRIE'VE, *v. a.* To pain; to vex; to afflict; to diſconſolate.—Aches, and hurts, and corns, do *engrieve* either towards rain, or towards ſnow. *Bacon.*

The gnawing anguiſh, and ſharp jealouſy,
Which his ſad ſpeech infixed in my breaſt,
Rankled ſo ſore, and feſter'd inwardly,
That my *engrieved* mind could find no reſt. *Spenſer.*

To ENGRO'SS, *v. a.* [*groſſir*, Fr.] To thicken; to make thick:

The waves ſo ſlow and ſluggiſh were,
Engroſs'd with mud, which did them foul agrieſe,
That every weighty thing they did upbear. *Spenſer.*

To increaſe in bulk.—Though pillars, by channelling, be ſeemingly *engroſſed* to our ſight, yet they are truly weakened in themſelves. *Wotton.*—To fatten; to plump up:

Not ſleeping, to *engroſs* his idle body;
But praying, to enrich his watchful ſoul. *Shakeſpeare.*

To ſeize in the groſs; to ſeize the whole of any thing.—Thoſe two things that ſo *engroſs* the deſires of both the nobler and ignobler ſort of mankind, are to be found in religion; namely, wiſdom and pleaſure. *South.*

A

A dog, a parrot, or an ape,
Or ſome worſe brute in human ſhape,
Engroſs the fancies of the fair. *Swift.*

To purchaſe the whole of any commodity for the ſake of ſelling at a high price. To write or copy in a large hand:

Here is th' indictment of the good lord Haſtings,
Which in a ſet hand fairly is *engroſs'd*. *Shakeſpeare.*

ENGROSS'ER, *ſ.* He that purchaſes large quantities of any commodity, in order to ſell it at a high price.—A new ſort of *engroſſers*, or foreſtallers, having the feeding and ſupplying this numerous body of workmen in the woollen manufactures, out of their warehouſes, ſet the price upon the poor landholder. *Locke.*

ENGROSS'MENT, *ſ.* Appropriation of things in the groſs; exorbitant acquiſition.—Thoſe held their immoderate *engroſſments* of power and favour by no other tenure than preſumption. *Swift.*

To ENGUA'RD, *v. a.* To protect; to defend; to ſurround as guards. *Not uſed.*

A hundred knights! yes, that on ev'ry dream,
He may *enguard* his dotage with their pow'rs,
And hold our lives at mercy. *Shakeſpeare.*

ENGUELEGUIN'GIT, a town of Africa, in the empire of Morocco, not far from Mogador.

EN'GYSCOPE, *ſ.* The ſame as microſcope.

ENHAL'LOW, one of the ſmaller Orkney iſlands, between Rowſa and Pamona.

To ENHAN'CE, *v. a.* [*hauſſer*, *enhauſſer*, Fr.] To lift up; to raiſe on high. *A ſenſe now obſolete.*

Both of them high at once their hands *enhanc'd*,
And both at once their huge blows down did ſway. *Spenſer.*

To raiſe; to advance; to heighten in price.—The deſire of money is every where the ſame; its vent varies very little, but as its greater ſcarcity *enhances* its price, and increaſes the ſcramble. *Locke.*—To raiſe in eſteem.—What is it but the experience of want that *enhances* the value of plenty? *L'Eſtrange.*—The remembrance of the difficulties we now undergo, will contribute to *enhance* our pleaſure. *Atterbury.*—To aggravate; to increaſe from bad to worſe.—To believe or pretend that whatever our hearts incite is the will of God within us, is the principle of villainy that hath acted in the children of diſobedience, *enhanced* and improved with circumſtances of greater impudence than the moſt abominable heathens were guilty of. *Hammond.*

ENHAN'CEMENT, *ſ.* Increaſe; augmentation of value.—Their yearly rents are not improved, the landlords making no leſs gain by fines than by *enhancement* of rents. *Bacon.*—Aggravation; increaſe of ill.—Jocular ſlanders have, from the ſlightneſs of the temptation, an *enhancement* of guilt. *Government of the Tongue.*

To ENHAR'BOUR, *v. a.* To harbour in:

O true delight, *enharbouring* the breſts
Of thoſe ſweet creatures with the plumy creſts. *W. Browne.*

ENHARMO'NIC, *adj.* The laſt of the three kinds of muſic. It abounds in dieſes, or the leaſt ſenſible diviſions of a tone. See the article MUSIC.

ENJE'DIM (George), a learned unitarian divine in the ſixteenth century, native of Hungary, whence he removed into Tranſylvania, where he became one of the ſuperintendants of the unitarian churches in that principality. He died in 1597. According to father Simon, he was one of the moſt acute defenders of that ſenſe of ſcripture for which the Socinian writers contend, and was the author of a work entitled *Explicatio Locorum Scripturæ Veteris & Novi Teſtamenti, ex quibus dogma Trinitatis ſtabiliri ſolet*, quarto. The greater part of the firſt impreſſion of this work, which appeared in Tranſylvania, having been burnt through the zeal of ſome advocates for the orthodox faith, a new edition of it was afterwards publiſhed in the Netherlands, where the ſide of the queſtion which it embraces has of courſe many ſupporters.

ENIG'MA, *ſ.* [*ænigma*, Lat. αινιγμα, Gr.] A riddle; an obſcure queſtion; a poſition expreſſed in remote and ambiguous terms.

ENIGMA'TICAL, *adj.* Obſcure; ambiguouſly or darkly expreſſed.—Your anſwer, ſir, is *enigmatical*. *Shakeſpeare.*—Cloudy; obſcurely conceived or apprehended.—Faith here is the aſſent to thoſe things which come to us by hearing, and are ſo believed by adherence, or dark *enigmatical* knowledge, but hereafter are ſeen or known demonſtratively. *Hammond.*

ENIGMA'TICALLY, *adv.* In a ſenſe different from that which the words in their familiar acceptation imply.—Homer ſpeaks *enigmatically*, and intends that theſe monſters are merely the creation of poetry. *Broome.*

ENIG'MATIST, *ſ.* One who deals in obſcure and ambiguous matters; a maker of riddles.—That I may deal more ingenuouſly with my reader than the abovementioned *enigmatiſt* has done, I ſhall preſent him with a key to my riddle. *Addiſon.*

To ENJO'IN, *v. a.* [*enjoindre*, Fr.] To direct; to order; to preſcribe. It is more authoritative than *direct*, and leſs imperious than *command*:

To ſatisfy the good old man,
I would bend under any heavy weight
That he'll *enjoin* me to. *Shakeſpeare.*

ENJOI'NER, *ſ.* One who iſſues injunctions.

ENJOIN'MENT, *ſ.* Direction; command.—Critical trial ſhould be made by public *enjoinment*, whereby determination might be ſettled beyond debate. *Brown.*

To ENJO'Y, *v. a.* [*jouir*, *enjouir*, Fr.] To feel or perceive with pleaſure; to have a pleaſing ſenſe of; to be delighted with:

I could *enjoy* the pangs of death,
And ſmile in agony. *Addiſon.*

To obtain poſſeſſion or fruition of.—Edward the ſaint, in whom it pleaſed God, righteous and juſt, to let England ſee what a bleſſing ſin and iniquity would not ſuffer it to *enjoy*. *Hooker.*

He, who, to *enjoy*
Plato's elyſium, leap'd into the ſea. *Milton.*

To pleaſe; to gladden; to exhilarate; to glad; to delight. This ſenſe is uſual with the reciprocal pronoun, and is derived from *enjouir*.—Creatures are made to *enjoy* themſelves, as well as to ſerve us. *More.*

To ENJO'Y, *v n.* To live in happineſs:

Then I ſhall be no more!
And Adam, wedded to another Eve,
Shall live with her *enjoying*, I extinct. *Milton.*

ENJOY'ER, *ſ.* One that has fruition or poſſeſſion.

ENJOY'MENT, *ſ.* Pleaſure; happineſs; fruition.—His hopes and expectations are bigger than his *enjoyments*. *Tillotſon.*

ENISE'I, a river of Ruſſia, which riſes in the borders of Chineſe Tartary, and taking a northern courſe, runs into the Frozen Ocean. Lat. 72. 20. N. lon. 100. 0. E. Ferro.

ENISEI'SK, a town of Ruſſian Siberia, in the government of Tobolſk, on the river Eniſei; large, populous, and fortified, with an extenſive juriſdiction, which pays annually a tribute in ſkins to the crown of Ruſſia: 400 miles eaſt-north-eaſt of Kollivan, 1692 eaſt-north-eaſt of Aſtrachan, and 2293 caſt-ſouth-eaſt of Peterſburgh. Lat. 58. 16. N. lon. 109. 36. E. Ferro.

E'NIX, a town of Spain, in the province of Grenada: eight miles weſt of Almeria.

To ENKIN'DLE, *v. a.* To ſet on fire; to inflame; to put in a flame:

Edmund, *enkindle* all the ſparks of nature
To quit this horrid act. *Shakeſpeare.*

To rouſe paſſions; to ſet the ſoul into a flame. To incite to any act or hope:

Your

Your hand
Gave ſign for me to leave you: ſo I did,
Fearing to ſtrengthen that impatience,
Which ſeem'd too much *enkindled*. *Shakeſpeare.*

ENKIO'PING, a town of Sweden, on the north ſide of the Mœler lake, in the province of Upland: twenty-one miles ſouth-weſt of Upſal.

EN'KIRCH, a town of Germany, in the circle of the Upper Rhine, and county of Sponheim: three miles north of Traarbach.

ENKU'SEN, a town of the iſland of Borneo.

To ENLA'RD, *v. a.* To pamper.—That were to *enlard* his fat-already pride. *Shakeſpeare.*

To ENLAR'GE, *v. a.* [*elargir*, Fr.] To make greater in quantity or appearance:

The wall, in luſtre and effect like glaſs,
Which o'er each object caſting various dyes,
Enlarges ſome, and others multiplies. *Pope.*

To increaſe any thing in magnitude, to extend.—Where there is ſomething both laſting and ſcarce, and ſo valuable to be hoarded up, there men will not be apt to *enlarge* their poſſeſſions of land. *Locke.*—To increaſe by repreſentation; to magnify; to exaggerate. To dilate; to expand.—O ye Corinthians, our mouth is open unto you, our mouth is *enlarged*. 2 *Cor.* vi. 11.—To ſet free from limitation.—Though ſhe appear honeſt to me, yet at other places ſhe *enlargeth* her mirth ſo far, that there is ſhrewd conſtruction made of her. *Shakeſpeare.*—To extend to more purpoſes or uſes.—It hath grown from no other root than only a deſire to *enlarge* the neceſſary uſe of the word of God, which deſire hath begotten an error, *enlarging* it farther than ſoundneſs of truth will bear. *Hooker.* To amplify; to aggrandiſe.—This is that ſcience which would truly *enlarge* mens minds, were it ſtudied. *Locke.*—To releaſe from confinement:

Enlarge the man committed yeſterday,
That rail'd againſt our perſon. *Shakeſpeare.*

To diffuſe in eloquence.—They *enlarged* themſelves upon this ſubject with all the invidious inſinuations they could deviſe. *Clarendon.*

To ENLAR'GE, *v. n.* To expatiate; to ſpeak in many words.—They appointed the chancellor of the exchequer to *enlarge* upon any of thoſe particulars. *Clarendon.*—To be further extended.—The caliphs obtained a mighty empire, which was in a fair way to have *enlarged*, until they fell out among themſelves. *Raleigh.*

ENLAR'GEMENT, *ſ.* Increaſe; augmentation; farther extenſion:

The ocean, which ſo long our hopes confin'd,
Could give no limits to his vaſter mind:
Our bounds' *enlargement* was his lateſt toil,
Nor hath he left us pris'ners to our iſle. *Waller.*

Releaſe from confinement or ſervitude.—If thou holdeſt thy peace at the time, then ſhall their *enlargement* and deliverance ariſe to the Jews from another place. *Eſther* iv. 14.—Magnifying repreſentation:

And all who told it, added ſomething new;
And all who heard it, made *enlargements* too. *Pope.*

Expatiating ſpeech; copious diſcourſe.—He concluded with an *enlargement* upon the vices and corruptions which were got into the army. *Clarendon.*

ENLAR'GER, *ſ.* Amplifier; one that increaſes or dilates any thing.—We ſhall not contentiouſly rejoin, but confer what is in us unto his name and honour, ready to be ſwallowed in any worthy *enlarger*. *Brown.*

To ENLI'GHT, *v. a.* To illuminate; to ſupply with light; to enlighten:

Wit from the firſt has ſhone on ages paſt,
Enlights the preſent, and ſhall warm the laſt. *Pope.*

To ENLIGH'TEN, *v. a.* To illuminate; to ſupply with light.—God will *enlighten* my darkneſs. *Pſalms.*—As the ſun ſhineth to the whole world, ſo there is no faith but this one publiſhed, the brightneſs whereof muſt *enlighten* all that come to the knowledge of the truth. *Hooker.*—To quicken in the faculty of viſion.—His eyes were *enlightened*. *Samuel.*

Love never fails to maſter what he finds;
The fool *enlightens*, and the wiſe he blinds. *Dryden.*

To inſtruct; to furniſh with increaſe of knowledge.—This doctrine is ſo agreeable to reaſon, that we meet with it in the writings of the *enlightened* heathens. *Spectator.*—To cheer; to exhilarate; to gladden. To illuminate with divine knowledge.—Thoſe who were once *enlightened*. *Hebrews.*

ENLIGH'TENER, *ſ.* Illuminator; one that gives light. Inſtructor:

O, ſent from heav'n,
Enlight'ner of my darkneſs! gracious things
Thou haſt reveal'd. *Milton.*

To ENLINK', *v. a.* To chain to; to connect.—*Enlinks* to waſte and deſolation. *Shakeſpeare.*

To ENLI'VEN, *v. a.* [from *life*, *live*.] To make quick; to make alive; to animate. To make vigorous or active:

Thoſe great orbs thus radically bright,
Primitive founts and origins of light,
Enliven worlds denied to human ſight. *Prior.*

To make ſprightly or vivacious. To make gay or cheerful in appearance.

ENLI'VENER, *ſ.* That which animates; that which puts in motion; that which invigorates:

But fire, th' *enlivener* of the general frame,
Is one, its operation ſtill the ſame:
Its principle is in itſelf; while ours
Works, as confed'rates war, with mingled pow'rs. *Dryden.*

To ENLU'MINE, *v. n.* [*enluminer*, Fr.] To illumine; to illuminate; to enlighten. *Not in uſe:*

For having yet, in his deducted ſpright,
Some ſparks remaining of that heav'nly fire,
He is *enlumin'd* with that goodly light,
Unto like goodly ſemblance to aſpire. *Spenſer.*

EN'MITY, *ſ.* [from *enemy*; as if *enemity*, *inamity*.] Unfriendly diſpoſition; malevolence; averſion.—Their being forced to their books, in an age at *enmity* with all reſtraint, has been the reaſon why many have hated books. *Locke.*—Contrariety of intereſts or inclinations; mutual malignity:

Between thee and the woman I will put
Enmity; and between thine and her ſeed;
Her ſeed ſhall bruiſe thy head, thou bruiſe his heel. *Milton.*

State of oppoſition.—Know ye not that the friendſhip of the world is *enmity* with God? *Jam.* iv. 4.—Malice; miſchievous attempts.—He who performs his duty in a ſtation of great power, muſt needs incur the utter *enmity* of many, and the high diſpleaſure of more. *Atterbury.*

To ENMAR'BLE, *v. a.* To turn to marble; to harden. *Obſolete:*

Their dying to delay,
Thou do'ſt *enmarble* the proud heart of her,
Whoſe love before their life they do prefer. *Spenſer.*

To ENME'SH, *v. a.* To net; to entangle; to intrap:

So will I turn her virtue into pitch;
And out of her own goodneſs make the net
That ſhall *enmeſh* them all. *Shakeſpeare.*

EN'NA, anciently a town of Sicily, ſituated on an eminence to the ſouth of the Chryſas; called the *centre of Sicily*. It was famous for a ſacred grove, in which the rape of Proſerpine happened; for a temple of Ceres, thence ſurnamed *Ennæa*, and *Ennenſis*; and for fine ſprings; whence the name. *Bochart.*

EN'NEAD, *ſ.* [from εννεας, Gr.] The number nine.

ENNEADECA'TERIS, *ſ.* [of εννεα, nine, and δεκατες, Gr. ten.] In chronology, a cycle or period of 19 ſolar

years, being the ſame as the Golden Number, and Lunar Cycle, or Cycle of the Moon. See CHRONOLOGY.

ENNEA'GON, *ſ.* [of εννεα, nine, and γωνια, Gr. an angle.] A plane geometrical figure of 9 ſides and angles; and is otherwiſe called a *nonagon*. If each ſide of this figure be 1, its area will be $6\cdot 1818242 = \frac{9}{4}$ of the tang. of 70 degrees, to the radius 1.

ENNEAHE'DRIA *ſ.* In natural hiſtory, a ſpecies of columnar double pointed ſpars.

ENNE'ALOGUE *ſ.* [from εννεα, nine, and λογος, Gr. a word.] A diſcourſe of nine parts. *Cole.*

ENNEA'LOGY *ſ.* [from εννεα, and λογος, Gr. a word.] A diſcourſe conſiſting of nine points; a treatiſe divided into nine parts. *Scott.*

ENNEAND'RIA, *ſ.* [from εννεα, nine, and ανηρ, a man or huſband.] In botany, the name of the ninth claſs in Linnæus's ſexual ſyſtem, conſiſting of plants which have hermaphrodite flowers with nine ſtamina or male organs. See BOTANY, vol. iii. p. 256.—It is alſo an order in the claſſes *Monadelphia* and *Dioecia*.

ENNEAPE'TALA COROLLA, *ſ.* In botany, a nine-petalled corolla; or, a flower of nine petals: as in *Thea viridis*, *Magnolia*, and *Liriodendron*.

ENNEA'TICAL, *adj.* [from εννεα, Gr.] *Enneatical days*, are every ninth day of a ſickneſs; and *enneatical years*, every ninth year of one's life.

ENNEBACK'A, a town of Norway: twenty-ſix miles ſouth-eaſt of Chriſtiana.

EN'NEL LOUGH, a lake of Ireland, in the county of Weſtmeath: two miles ſouth of Mullengar.

EN'NERIS, *ſ.* in the naval architecture of the ancients, a galley with nine tires of oars.

ENNEZA'T, a town of France, in the department of the Puy-de-Dôme, and chief place of a canton, in the diſtrict of Riom: one league and a half eaſt of Riom.

EN'NIS, a town of Ireland, in the county of Clare, large and populous, ſituated on the Fergus, which is navigable for large boats from the Shannon, which adds greatly to the trade of the town: ſeventeen miles north-weſt of Limerick. Lat. 52. 49. N. lon. 8. 54. W. Greenwich.

ENNISCOR'THY, a town of Ireland, in the county of Wexford; where is a manufacture of coarſe woollen cloth, and ſome conſiderable iron works: ten miles north of Wexford, and twenty-ſeven north-eaſt of Waterford.

ENNISKIL'LEN, a town of Ireland, in the county of Fermanagh, ſituated on an iſland in the river Erne, between the two parts of Lough Erne. The linen manufacture flouriſhes here, and produces its principal wealth: thirty-three miles weſt of Armagh, and forty-one ſouth of Londonderry.

EN'NIUS (Quintus), an early Roman poet of great fame, a native of Rudiæ in Calabria, born about the year of Rome 514, before Chriſt 237. He boaſted a deſcent from king Meſſapus, but he appears to have been in an humble condition of life. According to Silius Italicus, he ſerved as a centurion in Sardinia when that iſland was ſubdued by T. Manlius, and diſtinguiſhed himſelf by his valour. He probably remained in Sardinia after the war; for we are told by Corn. Nepos, that Cato the cenſor, when prætor, brought back with him from his government of Sardinia, the poet Ennius. He lived on terms of great intimacy with Scipio Naſica, as we learn from a jeſt recorded by Cicero (de Orat. l. ii.) Q. Fulvius, procured for him the citizenſhip of Rome. From the affection borne him by theſe eminent perſons, we may judge favourably of the character and manners of Ennius; though it is probable that his convivial talents carried him beyond the bounds of ſtrict ſobriety, ſince Horace (Epiſt. 19. l. i.) repreſents him as warming his heroic vein by liberal potations. The gout, which tormented his old age, was probably the conſequence of his intemperance; as, perhaps, was alſo his poverty; which evils, however, he bore with great equanimity. He lived to the age of ſeventy. A ſtatue, ſuppoſed to be of him, was extant in the monument of the Scipios, in the time of Livy. Ennius is regarded as the father of Latin epic or heroic poetry, and he appears to have been diſtinguiſhed by that force and vigour, accompanied with ruſticity and negligence, which is generally the character of genius in an unpoliſhed age. This is the idea given of him by Ovid:

Ennius ingenio maximus, arte rudis.
The bard in genius mighty, rude in art.

Lucretius ſpeaks of him as the firſt who brought the muſe to Latium; and Virgil proved his eſteem of him by tranſcribing into his works many whole or half lines from Ennius. It cannot be doubted that his poetry was very popular in Rome, ſince he made the great events of Roman hiſtory his topic in a large performance entitled "Annals," which, by the grammarian Q. Vargunteius, were afterwards divided into eighteen books. He was accuſtomed publicly to recite portions of this poem on certain days; and we learn from Gellius, that recitations from the Annals of Ennius were continued to his time. He alſo compoſed tragedies, comedies, epigrams, and ſatires; and he is praiſed as being the firſt who ventured to deſert the Grecian dramatic ſtories, and take his arguments from Roman hiſtory. Some didactic works of his are alſo mentioned. None of his pieces are come down to us entire, but fragments of ſeveral of them. Theſe have been publiſhed ſeparately, Amſterd. 4to. 1707, and alſo in the Corpus Poetar. of Mattaire.

To ENNO'BLE, *v. a.* [*ennoblir*, Fr.] To raiſe from commonalty to nobility:

Many fair promotions
Are given daily to *ennoble* thoſe,
That ſcarce, ſome two days ſince, were worth a noble.
Shakeſpeare.

To dignify; to aggrandiſe; to exalt; to raiſe.—God raiſed up the ſpirit of this great perſon, and *ennobled* his courage and conduct with the entire overthrow of this mighty hoſt. *South.*

What can *ennoble* ſots, or ſlaves, or cowards?
Alas! not all the blood of all the Howards. *Pope.*

To elevate; to magnify:

None ſo lovely, ſweet, and fair,
Or do more *ennoble* love. *Waller.*

To make famous or illuſtrious.—The Spaniards could not as invaders land in Ireland, but only *ennobled* ſome of the coaſts thereof with ſhipwrecks. *Bacon.*

ENNO'BLEMENT, *ſ.* The act of raiſing to the rank of nobility.—He added, during parliament, to his former creations, the *ennoblement* or advancement in nobility of a few others. *Bacon.*—Exaltation; elevation; dignity.—The eternal wiſdom enriched us with all *ennoblements*, ſuitable to the meaſures of an unreſtrained goodneſs. *Glanville.*

ENNO'DIUS (Magnus Felix), biſhop of Ticinum, now Pavia, in the ſixth century, deſcended from an illuſtrious family among the Gauls, and born in Italy, about the year 473. He was ordained one of the deacons by Epiphanius biſhop of Pavia, with whom he lived in habits of the ſtricteſt intimacy and friendſhip. Having from his early years been much attached to the ſtudy of rhetoric and poetry, he continued to cultivate his taſte for them, in connection with the ſubjects which were more immediately appropriate to his theological profeſſion. He was employed to draw up a Panegyric upon Theodoric king of the Oſtrogoths, in which he diſplayed an extenſive acquaintance with profane hiſtory, much eloquence, and a ſufficient portion of courtly adulation. But his rhetorical talents were exerciſed with more art, and leſs honour, in the Apology which he wrote for the council which acquitted pope Symmachus of the accuſations laid to his charge by Laurentius, his rival candidate for the pontifical chair. In this Apology, the colours of a gaudy rhetoric are artfully made uſe of to diſguiſe the truth; and the author's abilities are proſtituted to ſupport the foundation of that enormous power which the popes of Rome afterwards

wards acquired, by maintaining the doctrine, that the Roman pontiff was anſwerable to none upon earth for his conduct, and ſubject to no human tribunal. He obtained the reward of his ſervices, however, by being promoted to the ſee of Pavia; where he died in 521, aged forty-eight years. Beſides the Panegyric and Apology already mentioned, he was the author of 1. *Epiſtolarum ad Diverſos, Libri* ix. 2. *Vita B. Epiphanii, Epiſcopi Ticinenſis.* 3. *Vita B. Antonii, monachi Lirinenſis.* 4. *Euchariſticon de vita ſua ad Elpidium.* 5. *Dictiones ſacræ.* 6. *Scholaſticæ.* 7. *Ethicæ, &c.* 8. *Poemata.* 9. *Epigrammata, &c.* They were collected and publiſhed by Andrew Schottus, at Tournay, in 1610, 8vo. and by father Sirmond, at Paris, in 1611, 8vo.

ENNUI', *ſ.* [French; a term which ſeems naturalized in modern Engliſh, becauſe we have no word in our language exactly ſynonymous.] Languor or laſſitude of mind; irregularity or perplexity of thought; faſtidiouſneſs of temper. *Ennui* is a diſeaſe to thoſe who are determined to be diſſatisfied with every ſituation or event of human life. To prevent *ennui*, all thoſe employments which awaken ingenuity, which ſmooth the temper, and excite complacency of mind, ſhould be made the firſt rudiments of a liberal education. Chagrin, care, and regret, are commonly the *ennuis* of old age.

E'NO, a town of European Turkey, in the province of Romania; the ſee of a Greek archbiſhop: twenty-eight miles north-weſt of Gallipoli.

E'NO, a river of the American States, in North Carolina, which unites with Little and Flat rivers in Orange county, and forms the Neus, about ſeventeen miles below Hillſborough.

E'NOCH, [חנך Heb. dedicated.] The ſon of Jared, and father of Methuſelah, and the ſeventh man in a lineal deſcent from Adam, born in the year before Chriſt 3382. He was a prophet, eminent for his exalted piety and conſummate virtue in the midſt of a corrupt and vicious race of men; on which account he found ſuch favour in the ſight of God, that he was tranſlated to heaven without undergoing the pains of death, when he was 365 years old, or in the year before Chriſt 3017. St. Jude, in the 14th and 15th verſes of his Epiſtle, has quoted a prediction of this prophet, taken, according to the ſuppoſition of ſome critics, from an ancient book, containing the traditions of the Jewiſh church, which has been long ſince loſt; but according to others, from a work called "The Book, or the Prophecies of Enoch," cited by Irenæus, Clement of Alexandria, Tertullian, Athenagoras, Jerome, and others of the fathers. But whether St. Jude be conſidered as quoting the words of a prophecy preſerved by tradition, or as making uſe of expreſſions taken from ſome uncanonical author, there appears no reaſonable evidence to conclude that in the time of the apoſtles there exiſted any book which was to be aſcribed to the prophet Enoch.

E'NOCH, or CHA'NOCH, the name of a city built by Cain, which he named after his ſon Enoch. This is the firſt city we find mentioned in ſcripture. *Gen.* iv. 17.

E'NOCHS, a town of the American States, in the ſtate of Virginia: 145 miles weſt-ſouth-weſt of Virginia.

ENODA'TION, *ſ.* [*enodatio*, Lat.] The act of untying a knot. Solution of a difficulty.

ENO'DUS, *adj.* [from *e*, priv. and *nodus*, a knot.] In botany it means without knots or joints.

ENO'LA, a town of Italy, in the kingdom of Naples, and province of Lavora: four miles north of Fundi.

ENOMTE'KIS, a town of Swediſh Lapland: 150 miles north of Tornea.

E'NON, [Heb. his fountain.] A town of Paleſtine, ſituated near Salim, where John the Baptiſt exerciſed his functions. *John*, iii. 23.

ENORE'E, a north-weſt branch of Broad River in South Carolina. It ſeparates Pinckney and Ninety-ſix diſtricts of the American States, and joins Broad River about five miles below Tyger River.

ENO'RM, *adj.* [from *enormis*, Lat.] Wicked beyond meaſure:

I will, I will, if your courageous force
Dareth ſo much as it can well perform,
Tear out his curſed heart without remorſe,
The neſt of treaſon falſe, and guile *enorm.* *Fairfax.*

ENOR'MITY, *ſ.* Deviation from rule; irregularity. Deviation from right; depravity; corruption.—That this law will be always ſufficient to bridle or reſtrain *enormity*, no man can warrant. *Hooker.*—Atrocious crime; flagitious villainy; crimes exceeding the common meaſure. In this ſenſe it has a plural.—It is not a bare ſpeculation that kings may run into *enormities*; the practice may be proved by example. *Swift.*

ENOR'MOUS, *adj.* [*enormis*, Lat.] Irregular; out of rule; not regulated by any ſtated meaſure.—Wallowing, unwieldy, *enormous* in their gait. *Milton.*

Nature here
Wanton'd, as in her prime; and plaid at will
Her virgin fancies, pouring forth more ſweets,
Wild above rule, or art, *enormous* bliſs! *Paradiſe Loſt.*

Excurſive; beyond the limits of a regular figure.—The *enormous* part of the light in the circumference of every lucid point, ought to be leſs diſcernible in ſhorter teleſcopes than in longer, becauſe the ſhorter tranſmit leſs light to the eye. *Newton.*—Diſordered; confuſed:

I ſhall find time
From this *enormous* ſtate, and ſeek to give
Loſſes their remedies. *Shakeſpeare.*

Wicked beyond the common meaſure. Exceeding in bulk the common meaſures; always uſed with ſome degree of diſlike, or horror, or wonder:

A giant ſhepherd here his flock maintains,
Far from the reſt, and ſolitary reigns,
A form *enormous!* far unlike the race
Of human birth, in ſtature or in face. *Pope.*

ENOR'MOUSLY, *adv.* Beyond meaſure.—One who could never eſpouſe a notion ſo *enormouſly* abſurd and ſenſeleſs, as that the world was framed by chance. *Woodward.*

ENOR'MOUSNESS, *ſ.* Immeaſurable exceſs.—When thoſe who have no opportunity to examine our faith, ſee the *enormouſneſs* of our works, but what ſhould hinder them from meaſuring the maſter by the diſciple? *Decay of Piety.*

E'NOS, [אנוש Heb. mortal, ſickly, miſerable.] The ſon of Seth, and father of Cainan, born in the year of the world 235. Moſes tells us, Gen. iv. 26. that then "*men* began to call upon the name of the Lord;" or, as others tranſlate it, that "Enos began to call upon the name of the Lord;" denoting, that he was the inventor of religious rites and ceremonies in the external worſhip which was paid to God. This worſhip was kept up in Enos's family, while Cain's family was plunged in all manner of impieties. The Jews are of opinion, that idolatry was at firſt introduced into the world in the time of Enos. They tranſlate the Hebrew thus: "Then men began to *profane* the name of the Lord." Enos died at the great age of 905 years, in the year of the world 1140.

E'NOSBURG, a townſhip of the American States, in Franklin county, Vermont, about eighteen or twenty miles eaſt of Swantown.

ENOTAE'VSK, a town of Ruſſia, in the government of Caucaſus, on the Volga: ſeventy-two miles north-north-eaſt of Aſtrachan. Lat. 47. 15. N. lon. 64. 5. E. Ferro.

EN'OVATED, *adj.* Made new, brought up as ſomething new. *Scott.*

ENOUGH', *adj.* [Ðenoh, Sax. *ganah*, Goth. *genoeg*, Dut. It is not eaſy to determine whether this word be an adjective or adverb; perhaps, when it is joined with a ſubſtantive, it is an adjective, of which *enow* is the plural. In other ſituations it ſeems an adverb; except that after the verb *To have*, or *To be*, either expreſſed or underſtood, it may be accounted a ſubſtantive. It is pronounced as if it were written *enuf.*] In a ſufficient meaſure; ſo as may ſatisfy; ſo as may ſuffice.—When there was not room

enough for their herds, they by consent separated, and enlarged their pasture. *Locke.*

Why would'st thou go, with one consent they cry,
When thou hast gold *enough*, and Emily? *Dryden.*

ENOUGH', *s.* Something sufficient in greatness or excellence.—'Tis *enough* for me to have endeavoured the union of my country, whilst I continued in public employments. *Temple.*

Enough for me that to the list'ning swains,
First in those fields I sung the silvan strains. *Pope.*

Something equal to a man's powers or faculties.—Some great defects and main errors in his nature, customs, and proceedings, he had *enough* to do to save and help, with a thousand little industries and watches. *Bacon.*

ENOUGH', *adv.* In a sufficient degree; in a degree that gives satisfaction. It notes a slight augmentation of the positive degree: as, *I am ready* enough *to quarrel*; that is, I am rather quarrelsome than peaceable.—It is sometimes pleasant *enough* to consider the different notions which different persons have of the same thing. *Addison.*—Sometimes it notes diminution; as, the song is well *enough*; that is, not quite well, though not much amiss. An exclamation noting fulness or satiety:

Henceforth, I'll bear
Affliction 'till it do cry out itself,
Enough, enough, and die. *Shakespeare.*

"ENOUGH is as good as a Feast."—The French say, *Qui a assez, n'a plus rien à desirer:* He that has enough has nothing more to desire. The Latins, *Quod satis est, cui contingit, nihil amplius optet*; or, *Satis est quod sufficit*; *nimis est quod suffocat.* The Germans say, *Ein vergnugter muht is taglich, mohl leben:* A contented mind is a daily happiness. The French say likewise, *On est assez riche quand on a le necessaire:* Rich enough who has what is necessary. Proverbial sayings calculated to influence the minds of men to be satisfied with the dispensations of Providence, and content with moderate fortunes. They are likewise incitements to temperance and frugality.

To ENOUN'CE, *v. a.* [*enuncio*, Lat.] To declare.—He does not fear to *enounce* himself with shouts of exultation. *A. Smith.*

Listen to your Maker's voice
Mellifluous, which aloud the mild award
Enounces through your regions. *Bally's Day of Judgment.*

ENOW', the plural of *enough*. In a sufficient number.—There are at Rome *enow* modern works of architecture to employ any reasonable man. *Addison.*

Man had selfish foes *enow* besides,
That, day and night, for his destruction wait. *Milton.*

EN PAS'SANT, *adv.* [Fr.] By the way.

To ENPIE'RCE, *v. a.* To transfix:

I am too sore *enpierced* with his shaft
To soar with his light feathers. *Shakespeare.*

ENQUI'RY. See INQUIRY.

To ENRA'CE, *v. a.* [*enraciner*, Fr.] To root:

Whence he it fetcht out of her native place,
And did in stocke of earthly flesh *enrace*. *Spenser.*

To ENRA'GE, *v. a.* [*enrager*, Fr.] To irritate; to provoke; to make furious; to exasperate:

Enrag'd at this, upon the bawd I flew;
And that which most *enrag'd* me was, 'twas true. *Walsh.*

To ENRAN'GE, *v. a.* To place regularly; to put in order:

As fair Diana, in fresh summer's day,
Beholds her nymphs *enrang'd* in shady wood. *Spenser.*

To ENRAN'GE, *v. n.* To range:

Where, as this day I was *enraunging* it,
I chaunst to meet this knight. *Spenser.*

To ENRAN'K, *v. a.* To place in orderly ranks.—No leisure had he to *enrank* his men. *Shakespeare.*

To ENRAP'T, *v. a.* [from *rapt*: the participle preterite seems to be *enrapt*.] To throw into an extasy; to transport with enthusiasm:

I myself
Am, like a prophet, suddenly *enrapt*
To tell thee, that this day is ominous. *Shakespeare.*

In the following quotation it seems erroneously written for *enwrapt*, involved; wrapt up.—Nor hath he been so *enrapt* in those studies, as to neglect the polite arts of painting and poetry. *Arbuthnot.*

To ENRAP'TURE, *v. a.* To transport with pleasure; to delight highly:

Oft gazing on her shade, th' *enraptur'd* fair
Decreed the substance well deserv'd her care. *Shenstone.*

To ENRA'VISH, *v. a.* To throw into an extasy; to transport with delight:

What wonder,
Frail men, whose eyes seek heavenly things to see,
At sight thereof so much *enravish'd* be? *Spenser.*

ENRA'VISHMENT, *s.* Extasy of delight.—They contract a kind of splendour from the seemingly obscuring vail, which adds to the *enravishments* of her transported admirers. *Glanville.*

To ENRE'GISTER, *v. a.* To register:

And in the same, as in a brasen book,
To read *enregister'd* in every nook
His goodness, which his beauty doth declare. *Spenser.*

To ENRHEU'M, *v. a.* [*enrhumer*, Fr.] To have rheum through cold.—The physician is to enquire where the party hath taken cold or *enrheumed*. *Harvey.*

To ENRI'CH, *v. a.* [*enricher*, Fr.] To make wealthy; to make opulent.—The king will *enrich* him with great riches, and will give him his daughter. 1 *Sam.* xvii. 25.

Henry is able to *enrich* his queen,
And not to seek a queen to make him rich. *Shakespeare.*

To fertilise; to make fruitful:

See the sweet brooks in silver mazes creep,
Enrich the meadows, and supply the deep. *Blackmore.*

To store; to supply with augmentation of any thing desirable.—There is not any one among them that could ever *enrich* his own understanding with any certain truth, or ever edify others therein. *Raleigh.*

ENRICH'MENT, *s.* Augmentation of wealth. Amplification; improvement by addition.—It is a vast hindrance to the *enrichment* of our understandings, if we spend too much of our time and pains among infinites and unsearchables. *Watts.*

To ENRID'GE, *v. a.* To form with longitudinal protuberances or ridges:

He had a thousand noses,
Horns welk'd and wav'd like the *enridged* sea:
It was some fiend. *Shakespeare.*

To ENRIN'G, *v. a.* To bind round; to encircle; to adorn with a ring.—Ivy so *enrings* the barky fingers of the elm. *Shakespeare.*

To ENRI'PEN, *v. a.* To ripen; to mature; to bring to perfection:

The summer, how it *enripen'd* the year;
And autumn, what our golden harvests were. *Donne.*

To ENRI'VE, *v. a.* To force asunder.—And made a grisly wound in his *enriven* side. *Spenser.*

To ENRO'BE, *v. a.* To dress; to clothe; to habit; to invest:

Her mother hath intended,
That, quaint in green, she shall be loose *enrob'd*. *Shakesp.*

To ENROL'L, *v. a.* [*enroller*, Fr.] To insert in a roll, list, or register.—There be *enrolled* amongst the king's forces about thirty thousand men of the Jews. 1 *Mac.* x. 36.

—We find ourſelves *enrolled* in this heavenly family as ſervants, and as ſons. *Spratt.*

Mentes, an ever-honour'd name of old,
High in Ulyſſes' ſocial liſts *enroll'd*. *Pope.*

To record; to leave in writing:

Laws, which none ſhall find
Left them *enroll'd*; or what the ſpirit within
Shall on the heart engrave. *Milton.*

To involve; to inwrap:

From his infernal furnace forth he threw
Huge flame, that dimmed all the heaven's light,
Enroll'd in duſkiſh ſmoak and brimſtone blue. *Spenſer.*

ENROL'LER, *ſ.* He that enrols; he that regiſters.

ENROL'MENT, *ſ.* Regiſter; writing in which any thing is recorded; record.—The king himſelf cauſed to be enrolled, and teſtified by a notary public; and delivered the *enrolments*, with his own hands, to the biſhop of Saliſbury. *Davies on Ireland.*

ENROL'MENT, *ſ.* in law, the regiſtering or entering in the rolls of the chancery, king's-bench, common-pleas, or exchequer, or by the clerk of the peace in the records of the quarter ſeſſions, of any lawful act; as a ſtatute or recognizance acknowledged, a deed of bargain and ſale of lands, &c. An enrolment of a deed, may be either by the common law, or according to the ſtatute: and enrolment of deeds ought to be made in parchment, and recorded in court, for perpetuity's ſake. But the enrolling a deed doth not make it a record, though it thereby becomes a deed recorded: for there is a difference between matter of record, and a thing recorded to be kept in memory; a record being the entry in parchment of judicial matters controverted in a court of record, and whereof the court takes notice; whereas an enrolment of a deed is a private act of the parties concerned, of which the court takes no cognizance at the time of doing it, although the court permits it. 2 *Lil. Abr.* 69.

Every deed, before it is enrolled, is to be acknowledged to be the deed of the party before a maſter of the court of chancery, or a judge of the court wherein enrolled; which is the officer's warrant for enrolling of the ſame: and the enrolment of a deed, if it be acknowledged by the grantor, will be good proof of the deed itſelf upon a trial. A deed may be enrolled without the examination of the party himſelf; for it is ſufficient if oath is made of the execution. If two are parties, and the deed is acknowledged by one, the other is bound by it: and if a man lives in New York, &c. and would paſs land in England, a nominal perſon may be joined with him in the deed, who may acknowledge it here, and it will be binding. 1 *Salk.* 389. If the party dies before it is enrolled, it may be enrolled afterwards; and enrolments of deeds operate by virtue of the ſtatute of enrolments; but if livery and ſeiſin be had before the enrolling, it prevents the operation of the enrolment, and the party ſhall be in by that, as the more worthy ceremony to paſs eſtates. 2 *Nelſ. Abr.* 1010.

An indorſement on the back of the deed by the proper officer is ſufficient evidence of the enrolment. *Doug.* 56,8. And by 10 Anne, c. 18, where a bargain and ſale enrolled ſhall be pleaded with a profert, a copy of the enrolment ſigned by the proper officer, and proved on oath to be a true copy, ſhall be of the ſame force as the deed itſelf. Enrolment is ordained in divers caſes by ſtatute; of bargains and ſales by 27 Hen. VIII. c. 16. Deeds in corporations, &c. 34 and 35 Hen. VIII. c. 22. Of writings in the counties of Lancaſter and Cheſter, &c. 5 Eliz. c. 26. Grants from the crown of felons' goods, &c. 4 and 5 Wil. and Mary, c. 22. Alſo, of deeds and wills made of lands of papiſts.

To ENROO'T, *v. a.* To fix by the root; to implant deep:

He cannot ſo preciſely weed this land,
As his miſdoubts preſent occaſion:
His foes are ſo *enrooted* with his friends,
That, plucking to unfix an enemy,
He doth unfaſten ſo and ſhake a friend. *Shakeſpeare.*

To ENRO'UND, *v. a.* To environ; to ſurround; to encircle; to incloſe:

Upon his royal face there is no note
How dread an army hath *enrounded* him. *Shakeſpeare.*

ENS, *ſ.* [Lat.] A term for any being or exiſtence. In chemiſtry, ſome things that are ſaid to contain all the qualities or virtues of the ingredients they are drawn from.

ENS, a river of Germany, which riſes about four miles weſt of Raſtadt, in the archbiſhopric of Saltzburg, and runs into the Danube at Enns, in the archduchy of Auſtria.

ENS, or ENNS, a town of Germany, in the archduchy of Auſtria, ſituated at the conflux of the Ens and the Danube; founded about the year 900; ſituated on an eminence, well built and ſtrongly fortified; containing a convent, an arſenal, and two caſtles, one of which is ſurrounded with walls, and bears the name of Enſburg: forty-two miles eaſt-ſouth-eaſt of Paſſau, and eighty weſt of Vienna. Lat. 48. 13. N. lon. 32. 13. E. Ferro.

ENS, a town in the ſouthern part of the iſland of Schokland, in the Zuyder Sea: ten miles north-weſt of Campen.

ENS MAR'TIS, *ſ.* A name anciently given to the calx of iron which ariſes in ſublimation, with twice its quantity of ſal ammoniac. Medical practice does not now place this preparation in a higher rank of eſtimation than other calces of iron.

ENS VE'NERIS, *ſ.* The ens martis is in many diſpenſatories called by this name; others direct a ſublimation to be made with ſal ammoniac, and the calx of cupreous vitriol, a proceſs which it is well known affords no flowers, or at leaſt a quantity proportioned merely to the iron with which the vitriol of copper may be contaminated. Hence it appears, that there is really no ens veneris.

ENSAM'PLE, *ſ.* [*eſſempio*, Ital.] Example; pattern; ſubject of imitation. This orthography is now juſtly diſuſed.—Ye have us for an *enſample*. *Phil.* iii. 17.

Such life ſhould be the honour of your light;
Such death, the ſad *enſample* of your night. *Spenſer.*

To ENSAM'PLE, *v. a.* To exemplify; to ſhew by example; to give us a copy.—I have followed all the ancient poets hiſtorical: firſt, Homer, who, in the perſon of Agamemnon, *enſampled* a good governor and a virtuous man. *Spenſer.*

To ENSAN'GUINE, *v. a.* [*ſanguis*, Lat. *enſanglanter*, Fr.] To ſmear with gore; to ſuffuſe with blood:

With cruel tournament the ſquadrons join;
Where cattle paſtur'd late, now ſcatter'd lies,
With carcaſſes and arms, th' *enſanguin'd* field. *Milton.*

ENSA'TÆ, *ſ.* [*enſis*, Lat. a ſword.] In botany, the fifth order in Linnæus's Fragments, and the ſixth in the natural orders at the end of his *Gen. Pl.* containing ſome of the liliaceous plants, which have ſword-ſhaped leaves.

ENSCHE'DE, a town of the United Dutch States in Overiſſel: five miles ſouth from Oldezeel.

To ENSCHE'DULE, *v. a.* To inſert in a ſchedule or writing:

You muſt buy that peace
With full accord to all our juſt demands,
Enſchedul'd here. *Shakeſpeare.*

To ENSCON'CE, *v. a.* To cover as with a fort; to ſecure. *Hanmer.*—We make trifles of terrors, *enſconcing* ourſelves in ſeeming knowledge. *Shakeſpeare.*

A ſort of error to *enſconce*
Abſurdity and ignorance. *Hudibras.*

To ENSE'AM, *v. a.* To ſow up; to incloſe by a ſeam or juncture of needlework.—A name engraved in the reveſtiary of the temple, one ſtole away, and *enſeamed* it in his thigh. *Camden.*—To contain:

And bounteous Trent, that in himſelf *enſeames*
Both thirty ſorts of fiſh, and thirty ſundry ſtreams. *Spenſ.*

Upton's gloſſary interprets *enſeam* here by *fatten*; which interpretation, or the reaſons of the gloſſariſt, the compiler can by no means adopt. *Maſon.*

To

To ENSEA'R, *v. a.* To cauteriſe; to ſtanch or ſtop with fire:

Enſear thy fertile and conceptious womb;
Let it no more bring out t' ingrateful man. *Shakeſpeare.*

ENSEI'NT, *adj.* [law Fr.] With child.—A. died without iſſue born, but leaving his wife *enſeint*, or big with child. *Blackſtone.*

EN'SENE, a town of Egypt, on the eaſt ſide of the Nile: 120 miles ſouth of Cairo. Lat. 28. 5. N. lon. 48. 40. E. Ferro.

To ENSHIE'LD, *v. a.* To ſhield; to cover; to protect:

Theſe black maſks
Proclaim an *enſhield* beauty, ten times louder
Than beauty could diſplay. *Shakeſpeare.*

To ENSHRI'NE, *v. a.* To encloſe in a cheſt or cabinet; to preſerve and ſecure as a thing ſacred:

Fair fortune next, with looks ſerene and kind,
Receives 'em, in her ancient fane *enſhrin'd*. *Addiſon.*

ENSIF'EROUS, *adj.* [*enſifer*, Lat.] Sword-bearing.

EN'SIFORM, *adj.* [*enſiformis*, Lat.] Having the ſhape of a ſword, as the xiphoeides or *enſiform* cartilage. In botany, it denotes plants with ſword-ſhaped leaves, tapering from the baſe towards the point.

EN'SIGN, *ſ.* [*enſeigne*, Fr.] The flag or ſtandard of a regiment.—Hang up your *enſigns*, let your drums be ſtill. *Shakeſpeare.*—Any ſignal to aſſemble.—He will lift up an *enſign* to the nations from far. *Iſaiah* v.—Badge; or mark of diſtinction, rank, or office.—The marks or *enſigns* of virtues contribute, by their nobleneſs, to the ornament of the figures; as the decorations belonging to the liberal arts, to war, or ſacrifices. *Dryden.*

Princes that fly, their ſceptres left behind,
Contempt or pity, where they travel, find;
The *enſigns* of our pow'r about we bear,
And ev'ry land pays tribute to the fair. *Waller.*

The officer of foot who carries the flag. See the articles FLAG, and STANDARD.

EN'SIGN-BEARER, *ſ.* He that carries the flag; the enſign.—If it be true that the giants ever made war againſt heaven, he had been a fit *enſign-bearer* for that company. *Sidney.*

EN'SISHEIM, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the diſtrict of Colmar: four leagues ſouth of Colmar.

ENSKY'ED, *part. adj.* Carried to heaven.—I hold you as a thing *enſky'd* and ſainted. *Shakeſpeare.*

To ENSLA'VE, *v. a.* To reduce to ſervitude; to deprive of liberty.—While the balance of power is equally held, the ambition of private men gives neither danger nor fear, nor can poſſibly *enſlave* their country. *Swift.*

The conquer'd alſo, and *enſlav'd* by war,
Shall, with their freedom loſt, their virtue loſe. *Milton.*

To make over to another as his ſlave or bondman.—No man can make another man to be his ſlave, unleſs he hath firſt *enſlaved* himſelf to life and death, to pleaſure or pain, to hope or fear; command thoſe paſſions, and you are freer than the Parthian king. *Taylor.*—The more virtuouſly any man lives, and the leſs he is *enſlaved* to any luſt, the more ready he is to entertain the principles of religion. *Tillotſon.*

ENSLA'VEMENT, *ſ.* The ſtate of ſervitude; ſlavery; abject ſubjection.—The children of Iſrael, according to their method of ſinning, after mercies, and thereupon returning to a freſh *enſlavement* to their enemies, had now paſſed ſeven years in cruel ſubjection. *South.*

ENSLA'VER, *ſ.* He that reduces others to a ſtate of ſervitude:

What indignation in her mind,
Againſt *enſlavers* of mankind! *Swift.*

ENSNA'RE. See INSNARE.

To ENSNAR'LE, *v. a.* To entangle.—They in awayt would cloſely him *enſnarle*. *Spenſer.*

To ENSTA'L, &c. See INSTAL.

EN'STORF, a town of Germany, in the circle of Bavaria and Upper Palatinate: twenty-two miles north of Ratiſbon.

To ENSTY'LE, *v. a.* To denominate:

High on the plains of that renowned ile,
Which all men beauty's garden-plot *enſtyle*. *W. Browne.*

To ENSU'E, *v. a.* [*enſuivre*, Fr.] To follow; to purſue.—Flee evil, and do good; ſeek peace, and *enſue* it. *Common Prayer.*

To ENSU'E, *v. n.* To follow as a conſequence to premiſes.—Let this be granted, and it ſhall hereupon plainly *enſue*, that the light of ſcripture once ſhining in the world, all other light of nature is therewith in ſuch ſort drowned, that now we need it not. *Hooker.*—To ſucceed in a train of events, or courſe of time.—Of worſe deeds worſe ſufferings muſt *enſue*. *Milton.*

Then grave Clariſſa graceful wav'd her fan;
Silence *enſu'd*, and thus the nymph began. *Pope.*

ENSU'RANCE, *ſ.* Exemption from hazard, obtained by the payment of a certain ſum. The ſum paid for ſecurity.

ENSU'RANCER, *ſ.* He who undertakes to exempt from hazard:

The vain *enſurancers* of life,
And they who moſt perform'd, and promis'd leſs,
Ev'n Short and Hobbes, forſook th' unequal ſtrife. *Dryd.*

To ENSU'RE, *v. a.* [from *ſure*, *aſſurer*, Fr.] To aſcertain; to make certain; to ſecure.—It is eaſy to entail debts on ſucceeding ages, but how to *enſure* peace for any term of years is difficult enough. *Swift.*—To exempt any thing from hazard by paying a certain ſum, on condition of being reimburſed for miſcarriage. To promiſe reimburſement of any miſcarriage for a certain reward ſtipulated.—A mendicant contracted with a country fellow for a quantity of corn, to *enſure* his ſheep for that year. *L'Eſtrange.*

ENSU'RER, *ſ.* One who makes contracts of enſurance; one who for a certain ſum exempts any thing from hazard.

ENT (George), a learned phyſician and anatomiſt, born, in 1603, at Sandwich, ſon of a Flemiſh merchant who took refuge in England from the tyranny of the duke of Alva. He was brought up to letters; and after finiſhing his education at Cambridge, went abroad for the ſtudy of phyſic, and took his doctor's degree at Padua, in which, upon his return, he was incorporated at Oxford. He ſettled in London, and was admitted into the college of phyſicians, of which he filled the various offices with great reputation. He firſt made himſelf known as an author by a defence of Harvey's doctrine of the circulation, in a work entitled *Apologia pro Circulatione Sanguinis, qua reſpondetur Æmilio Pariſano*, 1641, reprinted with large additions in 1685. The anatomical reputation he had acquired cauſed him to be appointed one of the lecturers in that ſcience before the college of phyſicians. Charles II. once condeſcended to be his auditor, and after the lecture conferred upon him the honour of knighthood. He was one of the original members of that private philoſophical ſociety, which, after the reſtoration, formed the Royal Society. He publiſhed, in 1679, a controverſial piece, intitled *Antidiatriba in Malachiam Thruſton de Reſpirationis Uſu primario*, containing ſome obſervations upon Dr. Thruſton's work upon reſpiration, which he had firſt communicated to him in manuſcript. Sir George Ent died in 1689, at the age of eighty-ſix.

ENTA'BLATURE, or ENTABLEMENT, *ſ.* [from *table.*] In architecture, that part of an order of column which is over the capital, comprehending the architrave, frize, and cornice. It is alſo uſed for the laſt row of ſtones on the top of the wall of a building, on which the timber and covering

covering reſt; ſometimes called the *drip*, becauſe it projects a little to throw the water off.

ENTA'DA, *ſ.* in botany. See MIMOSA.

ENTA'IL, *ſ.* [*feudum talliatum*, from the Fr. *entaillé*, cut, from *tailler*, to cut.] The eſtate entailed or ſettled, with regard to the rule of its deſcent. The rule of deſcent ſettled for any eſtate. Engraver's work; inlay. *Obſolete:*

Well it appeared to have been of old,
A work of rich *entail*, and curious mold,
Woven with anticks and wild imagery. *Spenſer.*

To ENTA'IL, *v. a.* [*entailler*, Fr. from *tailler*, to cut.] To ſettle the deſcent of any eſtate, ſo that it cannot be by any ſubſequent poſſeſſor bequeathed at pleaſure:

Had Richard unconſtrain'd reſign'd the throne,
A king can give no more than is his own:
The title ſtood *entail'd*, had Richard had a ſon. *Dryden.*

To fix unalienably upon any perſon or thing.—None ever had a privilege of infallibility *entailed* to all he ſaid. *Digby.*—The intemperate and unjuſt tranſmit their bodily infirmities and diſeaſes to their children, and *entail* a ſecret curſe upon their eſtates. *Tillotſon.*—To cut. *Obſolete.* In the following paſſage it is neuter:

The mortal ſteel, diſpiteouſly *entail'd*,
Deep in their fleſh, quite through the iron walls
That a large purple ſtream adown their giambeaux falls.
Spenſer.

To carve for ornament:

All bar'd with golden bendes, which were *entayl'd*
With curious antickes, and full fayre aumayld. *Spenſer.*

To ENTA'ME, *v. a.* To tame; to ſubjugate; to ſubdue:

'Tis not your inky brows, your black ſilk hair,
Your bugle eyeballs, and your cheek of cream,
That can *entame* my ſpirits to your worſhip. *Shakeſpeare.*

To ENTAN'GLE, *v. a.* [A word of uncertain etymology.] To inwrap or inſnare with ſomething not eaſily extricable, as a net; or ſomething adheſive, as briars. To loſe in multiplied involutions; as in a labyrinth. To twiſt, or confuſe in ſuch a manner as that a ſeparation cannot eaſily be made; to make an *entangled* knot. To involve in difficulties; to embarraſs; to perplex.—He knew not how to wreſtle with deſperate contingencies, and ſo abhorred to be *entangled* in ſuch. *Clarendon.*

Now all labour,
Marrs what it does, yea, very force *entangles*
Itſelf with ſtrength. *Shakeſpeare.*

To puzzle; to bewilder.—I ſuppoſe a great part of the difficulties that perplex men's thoughts, and *entangle* their underſtandings, would be eaſily reſolved. *Locke.*—To enſnare by captious queſtions or artful talk.—The phariſees took council how they might *entangle* him in his talk. *Matt.* xxii. 15.—To diſtract with variety of cares.—No man that warreth *entangleth* himſelf with the affairs of this life. 2 *Tim.* ii. 4.—To multiply the intricacies or difficulties of a work.

ENTAN'GLEMENT, *ſ.* Involution of any thing intricate or adheſive. Perplexity; puzzle.—The moſt improved ſpirits are frequently caught in the *entanglements* of a tenacious imagination. *Glanville.*

ENTAN'GLER, *ſ.* One that entangles.

ENTA'TICA, *ſ.* [from ἐντείνω, Gr. to ſtrain.] Provocatives; medicines which create luſt.

ENTELE'CHIA, *ſ.* [Gr.] A word uſed by Ariſtotle to expreſs the human mind.

ENTEL'LUS, a famous athlete among the friends of Æneas. He was intimate with Eryx, and entered the liſts againſt Dares, in the funeral games of Anchiſes, in Sicily. *Virgil.*

To E'NTER, *v. a.* [*entrer*, Fr.] To go or come into any place.

I with the multitude of my redeem'd,
Shall *enter* heav'n long abſent. *Milton.*

To initiate in a buſineſs, method, or ſociety.—The eldeſt being thus *enter'd*, and then made the faſhion, it would be impoſſible to hinder them. *Locke.*—To introduce or admit into any counſel:

They of Rome are *enter'd* in our counſels,
And know how we proceed. *Shakeſpeare.*

To ſet down in writing:

Mr. Phang, have you *enter'd* the action?
—It is *enter'd*. *Shakeſpeare.*

To E'NTER, *v. n.* To come in; to go in.—Be not ſlothful to go and to *enter* to poſſeſs the land. *Judges.*—To penetrate mentally; to make intellectual entrance.—He is particularly pleaſed with Livy for his manner of telling a ſtory, and with Salluſt for his *entering* into eternal principles of action. *Addiſon.*—To engage in.—The French king hath often *entered* on ſeveral expenſive projects, on purpoſe to diſſipate wealth. *Addiſon.*—To be initiated in.—As ſoon as they once *enter'd* into a ſtate of pleaſure, politeneſs, and magnificence, they fell into a thouſand violences, conſpiracies, and diviſions. *Addiſon.*

O pity and ſhame, that thoſe who to live well
Enter'd ſo fair, ſhould turn aſide! *Milton.*

ENTERDE'AL, *ſ.* [*entre* and *deal.*] Reciprocal tranſactions. *Obſolete:*

To learn the *enterdeal* of princes ſtrange,
To mark th' intent of counſels, and the change
Of ſtates. *Hubberd's Tale.*

ENTEREN'CHYTA, *ſ.* [from ἐντερα, the bowels, and ἐγχυω, Gr. to infuſe into.] An inſtrument for adminiſtering clyſters.

EN'TERING, *ſ.* Entrance; paſſage into a place.—It is laid waſte, ſo that there is no houſe, no *entering* in. *Iſaiah.*

ENTERI'TIS, *ſ.* [from ἐντερα, Gr. the bowels.] An inflammation of the bowels.

To ENTERLA'CE, *v. a.* [*entrelaſſer*, Fr.] To intermix; to interweave.—This lady walked outright, 'till we might ſee her enter into a fine cloſe arbour: it was of trees, whoſe branches ſo lovingly *enterlaced* one another, that it could reſiſt the ſtrongeſt violence of the ſight. *Sidney.*

ENTEROCE'LE, *ſ.* [from ἐντερα, the bowels, and κηλη, Gr. a tumour.] An inteſtinal hernia.

ENTEROEPIPLOCE'LE, *ſ.* [from ἐντερα, the bowels, ἐπιπλοον, the omentum, and κηλη, Gr. a rupture.] A rupture of the omentum and the inteſtines, in which they protrude themſelves through the integuments of the belly.

ENTEROHYDROCE'LE, *ſ.* [from ἐντερα, the bowels, and ὑδροκηλη, Gr. a dropſy of the ſcrotum.] A dropſy of the ſcrotum, with a deſcent of the inteſtine.

ENTERO'LOGY, *ſ.* [ἐντερον and λογος, Gr.] The anatomical account of the bowels and internal parts.

ENTEROM'PHALOS, *ſ.* [from ἐντερα, the inteſtines, and ομφαλος, Gr. the navel.] A rupture of the inteſtines at the navel.

EN'TERON, *ſ.* [from ἐντος, Gr. within.] An inteſtine.

ENTEROSCHEOCE'LE, *ſ.* [from ἐντερα, the inteſtines, and οσχεοκηλη, Gr. a rupture of the ſcrotum.] A rupture of the inteſtines into the ſcrotum.

ENTERPAR'LANCE, *ſ.* [*entre* and *parler*, Fr.] Parley; mutual talk; conference.—During the *enterparlance* the Scots diſcharged againſt the Engliſh, not without breach of the laws of the field. *Hayward.*

ENTERPLE'ADER, in law. See INTERPLEADER.

EN'TERPRISE, *ſ.* [*entrepriſe*, Fr.] An undertaking of hazard; an arduous attempt.—Now is the time to execute mine *enterpriſes* to the deſtruction of the enemies. *Judith* xiii. 5.

The day approach'd, when fortune ſhould decide
The important *enterpriſe*, and give the bride. *Dryden.*

To EN'TERPRISE, *v. a.* To undertake; to attempt; to eſſay.—Princes were only chiefs of thoſe aſſemblies, by whoſe conſultations and authority the great actions were reſolved and enterpriſed. *Temple.*

Haſte then, and loſe no time:
The buſineſs muſt be *enterpris'd* this night;
We muſt ſurpriſe the court in its delight. *Dryden.*

To receive; to entertain. *Obſolete:*

In goodly garments, that her well became,
Fair marching forth in honourable wiſe,
Him at the threſhold met, and well did *enterpriſe*. *Spenſer.*

EN'TERPRISER, *ſ.* A man of enterpriſe; one who undertakes great things; one who engages himſelf in important and dangerous deſigns.—They commonly proved great *enterpriſers* with happy ſucceſs. *Hayward.*

To ENTERTA'IN, *v. a.* [*entretenir*, Fr.] To converſe with; to talk with.—His head was ſo well ſtored a magazine, that nothing could be propoſed which he was not readily furniſhed to *entertain* any one in. *Locke.*—To treat at the table.—You ſhall find an apartment fitted up for you, and ſhall be every day *entertained* with beef or mutton of my own feeding. *Addiſon.*—To receive hoſpitably.—Be not forgetful to *entertain* ſtrangers; for thereby ſome have *entertained* angels unawares. *Heb.* xiii. 2.

Heaven, ſet ope thy everlaſting gates,
To *entertain* my vows of thanks and praiſe. *Shakeſpeare.*

To keep in one's ſervice.—You, ſir, I *entertain* for one of my hundred; only I do not like the faſhion of your garments. *Shakeſpeare.*—To reſerve in the mind.—This purpoſe God can *entertain* towards us. *Decay of Piety.*—To pleaſe; to amuſe; to divert.—The hiſtory of the Royal Society ſhews how well philoſophy becometh a narration! the progreſs of knowledge is as *entertaining* as that of arms. *Felton.*—To admit with ſatisfaction.—Reaſon can never permit the mind to *entertain* probability in oppoſition to knowledge and certainty. *Locke.*—To make choice of:

But when he lookt about on every ſyde,
To weet which way were beſt to *entertaine*,
To bring him to the place where he would faine,
He could no path nor tract of foot deſcry. *Spenſer.*

ENTERTA'IN, *ſ.* Entertainment:

But neede, that anſwers not to all requeſts,
Bad them not looke for better *entertaine*. *Spenſer.*

ENTERTA'INER, *ſ.* He that keeps others in his ſervice.—He was, in his nature and conſtitution of mind, not very apprehenſive or forecaſting of future events afar off, but an *entertainer* of fortune by the day. *Bacon.*—He that treats others at his table.—It is little the ſign of a wiſe or good man to ſuffer temperance to be tranſgreſſed, in order to purchaſe the repute of a generous *entertainer*. *Atterbury.*—He that pleaſes, diverts, or amuſes.

ENTERTA'INMENT, *ſ.* Converſation. Treatment at the table; convivial proviſion:

With Britiſh bounty in his ſhip he feaſts
Th' Heſperian princes, his amazed gueſts,
To find that wat'ry wilderneſs exceed
The *entertainment* of their great Madrid. *Waller.*

Hoſpitable reception. Reception; admiſſion.—It is not eaſy to imagine how it ſhould at firſt gain *entertainment*, but much more difficult to conceive how it ſhould be univerſally propagated. *Tillotſon.*—The ſtate of being in pay as ſoldiers or ſervants.—Have you an army ready, ſay you?——A moſt royal one. The centurions and their charges diſtinctly billetted, already in the *entertainment*, and to be on foot at an hour's warning. *Shakeſpeare.*—Payment of ſoldiers or ſervants. *Now obſolete.*—The captains did covenant with the king to ſerve him with certain numbers of men, for certain wages and *entertainment*. *Davies.*—Amuſement; diverſion.—Paſſions ought to be our ſervants, and not our maſters; to give us ſome agitation for *entertainment*, but never to throw reaſon out of its ſeat. *Temple.*—Dramatic performance; the lower comedy.—A great number of dramatic *entertainments* are not comedies, but five-act farces. *Gay.*

To ENTERTA'KE, *v. a.* To entertain; to receive.—And with more myld aſpect thoſe two to *entertake*. *Spenſer.*

ENTERTIS'SUED, *adj.* [*entre* and *tiſſue*, Fr.] Enterwoven or intermixed with various colours or ſubſtances:

The ſword, the mace, the crown imperial,
The *entertiſſued* robe of gold and pearl. *Shakeſpeare.*

ENTERVIEW', *ſ.* in falconry, is the ſecond year of a hawk's age.

To ENTHAL'MIZE, *v. a.* [from *enthalmizo*, Lat.] To bring the bride and bridegroom to the bedchamber. *Scott. Not much uſed.*

ENTHE'AL, *adj.* [from εν, in, and θεος, Gr. God.] Divinely inſpired.

ENTHEAS'TICAL, or ENTHEATED, *adj.* Inſpired; divinely inſpired. *Scott. Not much uſed.*

ENTHE'MA, *ſ.* [from εν, in, and τιθημι, Gr. to place.] With phyſicians, a medicine to ſtop bleeding.

ENTHE'MATA, *ſ.* [from εν, in, and τιθημι, Gr. to place.] Grafts inſerted into the ſlits of trees. *Not uſed.*

To ENTHRO'NE, *v. a.* To place on a regal ſeat:

Mercy is above this ſcepter'd ſway:
It is *enthroned* in the hearts of kings;
It is an attribute to God himſelf. *Shakeſpeare.*

To inveſt with ſovereign authority.—This pope was no ſooner elected and *enthroned*, but that he began to exerciſe his new rapines. *Ayliffe.*

To ENTHRO'NIZE, *v. a.* To enthrone:

Right princely virtue, fit to reign,
Enthroniz'd in her ſpirit remain. *Davis's Aſtræa.*

ENTHU'SIASM, *ſ.* [*enthuſiaſmus*, Lat. from ενθουσιαζω, Gr. to rave.] A vain belief of private revelation; a vain confidence of divine favour or communication.—*Enthuſiaſm* is founded neither on reaſon nor divine revelation, but riſes from the conceits of a warmed or overweening brain. *Locke.*—Heat of imagination; violence of paſſion; confidence of opinion.—Elevation of fancy; exaltation of ideas.—Imaging is, in itſelf, the very height and life of poetry, which, by a kind of *enthuſiaſm*, or extraordinary emotion of ſoul, makes it ſeem to us that we behold thoſe things which the poet paints. *Dryden.*

ENTHU'SIAST, *ſ.* [ενθουσιαω, Gr.] One who vainly imagines a private revelation, or who has a vain confidence of his intercourſe with God.—Let an *enthuſiaſt* be principled that he or his teacher is inſpired, and acted by an immediate communication of the Divine Spirit, and you in vain bring the evidence of clear reaſon againſt his doctrine. *Locke.*—One of a hot imagination, or violent paſſions.—Chapman ſeems to have been of an arrogant turn, and an *enthuſiaſt* in poetry. *Pope.*—One of elevated fancy, or exalted ideas:

Divine Cecilia came,
Inventreſs of the vocal frame;
The ſweet *enthuſiaſt*, from her ſacred ſtore,
Enlarg'd the former narrow bounds,
And added length to ſolemn ſounds,
With nature's mother-wit, and arts unknown before. *Dryd.*

ENTHUSIAS'TIC, or ENTHUSIASTICAL, *adj.* [from ενθουσιαστικος, Gr.] Perſuaded of ſome communication with the deity.—He pretended not to any ſeraphic *enthuſiaſtical* raptures or inimitable unaccountable tranſports of devotion. *Calamy.*—Vehemently hot in any cauſe. Elevated in fancy; exalted in ideas.—An *enthuſiaſtic* or prophetic ſtyle, by reaſon of the eagerneſs of the fancy, doth not always follow the even thread of diſcourſe. *Burnet.*

At laſt, ſublim'd
To rapture and *enthuſiaſtic* heat,
We feel the preſent Deity. *Thomſon.*

EN'THYMEME, *ſ.* [ενθυμημα, Gr.] In logic, an argument conſiſting only of an antecedent and conſequential propoſition;

propoſition; a ſyllogiſm where the major propoſition is ſuppreſſed, and only the minor and conſequence produced in words.—Playing much upon the ſimple or luſtrative argumentation, to induce their *enthymemes* unto the people, they take up popular conceits. *Brown.*—What is an *enthymeme*, quoth Cornelius? Why an *enthymeme*, replied Crambe, is when the major is indeed married to the minor, but the marriage kept ſecret. *Arbuthnot.*

To ENTI'CE, *v. a.* [of uncertain etymology.] To allure; to attract; to draw by blandiſhments or hopes to ſomething ſinful or deſtructive.—If a man *entice* a maid that is betrothed, he ſhall ſurely endow her to be his wife. *Ex.* xxii. 16.

So ſang the ſyrens with enchanting ſound,
Enticing all to liſten, and be drown'd. *Granville.*

ENTI'CEMENT, *ſ.* The act or practice of alluring to ill.—Suppoſe we that the ſacred word of God can at their hands receive due honour, by whoſe *enticement* the holy ordinances of the church endure every where open contempt? *Hooker.*

And here to every thirſty wanderer,
By ſly *enticement* gives his baneful cup,
With many murmurs mixt. *Milton.*

The means by which one is allured to ill; blandiſhment; allurement.—In all theſe inſtances we muſt ſeparate intreaty and *enticements* from deceit or violence. *Taylor.*

ENTI'CER, *ſ.* One that allures to ill.

ENTI'CINGLY, *adv.* Charmingly; in a winning manner.—She ſtrikes a lute well, and ſings moſt *enticingly*. *Addiſon.*

EN'TIERTY, *ſ.* [*entierté*, Fr.] The whole; not barely a part.—Sometime the attorney thruſteth into the writ the uttermoſt quantity; or, elſe ſetteth down an *entierty*, where but a moiety was to be paſſed. *Bacon.*

ENTI'RE, *adj.* [*entier*, Fr. *integer*, Lat.] Whole; undivided.—It is not ſafe to divide, but to extol the *entire*, ſtill in general. *Bacon.*—Unbroken; complete in its parts.—An antique model of the famous Laocoon is *entire* in thoſe parts where the ſtatue is maimed. *Addiſon on Italy.*—Full; complete; compriſing all requiſites in itſelf.—An action is *entire* when it is complete all its parts: or, as Ariſtotle deſcribes it, when it conſiſts of a beginning, a middle, and an end. *Spectator.*—Sincere; hearty:

Love's not love,
When it is mingled with regard that ſtands
Aloof from the *entire* point. *Shakeſpeare.*

Firm; ſure; ſolid; fixed:

Entire and ſure the monarch's rule muſt prove,
Who founds her greatneſs on her ſubjects' love. *Prior.*

Unmingled; unallayed:

Wrath ſhall be no more
Thenceforth, but in thy preſence joy *entire*. *Milton.*

Honeſt; firmly adherent; faithful.—No man had ever a heart more *entire* to the king, the church, or his country; but he never ſtudied the eaſieſt ways to thoſe ends. *Clarendon.*—In full ſtrength; with vigour unabated; with power unbroken.—Then back to fight again, new breathed and entire. *Spenſer.*—Inward:

Deep in the cloſet of my parts *entire*
Her worth is written with a golden quill. *Spenſer.*

ENTIRE'LY, *adv.* In the whole; without diviſion.—Euphrates, running, ſinketh partly into the lakes of Chaldea, and falls not *entirely* into the Perſian ſea. *Raleigh.*—Chyle may be ſaid to be a vegetable juice in the ſtomach and inteſtines; as it paſſeth into the lacteals it grows ſtill more animal, and when it hath circulated often with the blood, it is *entirely* ſo. *Arbuthnot.*

Completely; fully:

Here finiſh'd he, and all that he had made
View'd; and behold! all was *entirely* good. *Milton.*

With firm adherence; faithfully:

Which when his penſive lady ſaw from far,
Great woe and ſorrow did her ſoul aſſay,
As weening that the ſad end of the war,
And 'gan to higheſt God *entircly* pray. *Spenſer.*

ENTI'RENESS, *ſ.* Totality; completeneſs; fulneſs.—In an arch, each ſingle ſtone, which, if ſevered from the reſt, would be perhaps defenceleſs, is ſufficiently ſecured by the ſolidity and *entireneſs* of the whole fabric, of which it is a part. *Boyle.*—Honeſty; integrity.

ENTI'RETY, *ſ.* Completeneſs.—This is the natural and regular conſequence of the union and *entirety* of their intereſt. *Blackſtone.*

To ENTI'TLE, *v. a.* [*entituler*, Fr.] To grace or dignify with a title or honourable appellation. To give a title or diſcriminative appellation; as, to *entitle* a book.—Beſides the Scripture, the books which they call eccleſiaſtical were thought not unworthy to be brought into public audience, and with that name they *entitled* the books which we term apocryphal. *Hooker.*

Next favourable thou,
Who highly thus to *entitle* me vouchſaf'ſt
Far other name deſerving! *Milton.*

To ſuperſcribe, or prefix as a title.—How ready zeal for party is to *entitle* Chriſtianity to their deſigns, and to charge atheiſm on thoſe who will not ſubmit. *Locke.*—To give a claim to any thing.—God diſcovers the martyr and confeſſor without the trial of flames and tortures; and will hereafter *entitle* many to the rewards of actions which they had never the opportunity of performing. *Addiſon.*—To grant any thing as claimed by a title.—This is to *entitle* God's care how and to what we pleaſe. *Locke.*

EN'TITY, *ſ.* [*entitas*, low Lat.] Something which really is; a real being.—Fortune is no real *entity*, nor phyſical eſſence, but a mere relative ſignification. *Bentley.*

Dear hope, earth's dowry and heaven's debt,
The *entity* of things that are not yet:
Subt'leſt, but ſureſt being. *Craſhaw.*

A particular ſpecies of being.—All eruptions of air, though ſmall and ſlight, give an *entity* of ſound, which we call crackling, puffing, and ſpitting; as in bay ſalt and bay leaves, caſt into the fire. *Bacon.*

ENTLIBU'CH, a town of Swiſſerland, in the canton of Lucern; the principal place of a bailiwic, about nine leagues long, and ſix wide: which applied to the Swiſs to be relieved from the oppreſſions of its lords in the year 1386: twelve miles weſt of Lucern.

ENTO'GANUM, *ſ.* in botany. See MELICOPE.

To ENTO'IL, *v. a.* To enſnare; to entangle; to bring into toils or nets.—He cut off their land forces from their ſhips, and *entoiled* both their navy and their camp with a greater power than theirs, both by ſea and land. *Bacon.*

To ENTO'MB, *v. a.* To put into a tomb; to bury.—Proceſſions were firſt begun for the interring of holy martyrs, and the viſiting of thoſe places where they were *entombed*. *Hooker.*

They within the beaſt's vaſt womb,
The choice and flow'r of all their troops *entomb*. *Denham.*

ENTOMO'LOGY, *ſ.* [from εντομον, an inſect; of εν, in, and τεμνω, to cut, becauſe of the cuts or indented rings on its abdomen; and λογος, Gr. diſcourſe.] The ſcience which inveſtigates the nature, ſtructure, and economy, of inſects; called likewiſe *inſectology*. On the ſlighteſt view of this ſubject, we cannot but be ſtruck with the extenſive range which Providence has aſſigned to theſe diminutive animals, which are found to pervade the whole empire of Nature, in numbers which defy all powers of computation: and in nothing does the immenſity of creation more wonderfully appear, than in the infinite variety and beauty of the inſect tribes. In their manners and habitudes they form reſemblances with almoſt every other animal: ſome walk like quadrupeds, or creep like reptiles;

tiles; others fly like birds, while others again ſwim, and live in the water, like fiſhes. Entomology, therefore, of all the departments of natural hiſtory, preſents the wideſt field for inveſtigation. The number of experiments and obſervations neceſſary to furniſh a complete hiſtory of ſo many tribes of animals, is not only great, but the difficulty of making them is alſo immenſe. The number of ideas with which a ſkilful botaniſt muſt load his memory, before he can acquire an accurate knowledge of plants, is no doubt great: his taſk, however, bears no proportion to that of the entomologiſt; for, amidſt ſo many plants, there is perhaps hardly one that does not furniſh nouriſhment and an habitation to ſeveral inſects; while many, ſuch as the oak, afford a retreat for ſome hundreds of different families. Plants, however, are far from being the only abode of inſects; vaſt numbers reſide upon the larger animals, whom they continually ſuck; many live upon and devour others of their own kind: the earth ſwarms with multitudes, while the air teems with others, too numerous for the imagination to conceive!

But though a completc hiſtory of this large and populous part of nature's empire cannot be expected; yet, ſuch a general outline may be given, as ſhall demonſtrate the exiſtence of that great vivifying principle by which ſhe is animated, and by which ſhe is enabled continually to pour forth into exiſtence ſuch immenſe numbers of organized beings. Such an enquiry will preſent to us a pleaſing view of that protection which Providence affords even to the ſmalleſt of its creatures; of the means it employs for perpetuating them; and of that wonderful arrangement by which one ſet of beings ſubſiſt upon another, and by which life is renovated and held on through every part of the creation, without a pauſe. It is therefore extraordinary that the ſtudy of entomology ſhould have been deemed an employment the moſt uſeleſs and frivolous in which the human mind can be engaged: and it is to be lamented that many have been in conſequence deterred from contemplating the wonders diſplayed by nature, in a kingdom of animals the moſt numerous, diverſified, and ſplendidly adorned, of any on the face of the globe; and hence have deprived themſelves of views of the power and munificence of the Author of Nature, the moſt ſtriking and intereſting that can be preſented to the mind of man.

To thoſe, however, who even derive no pleaſure from the ſtudies of a liberal mind, and who feel no ſatisfaction in any employment that is not attended with immediate profit, the reſearches of the entomologiſt may not be altogether uſeleſs. Had the operations of the ſilkworm never been examined, how could men have availed themſelves of the labour of an inſect that adminiſters ſo profuſely to the richneſs and elegance of our dreſs? It was not to the unobſerving eye that it firſt occurred, that the produce of that animal's labour might be converted into a conſiderable article of commerce, and might give riſe to many arts, and afford ſubſiſtence to thouſands of manufacturers. In the ſame manner, wax and honey enter into the articles of commerce, and add to our luxuries. It cannot, therefore, be denied, but that thoſe naturaliſts were profitably employed who firſt obſerved the induſtry of the bee; who brought that animal from its native woods, introduced it into the hive, and, by domeſticating it there, have rendered it ſubſervient to our enjoyments.

The Chineſe, whoſe progreſs in many of the arts is deſervedly celebrious, avail themſelves of the labours of certain inſects in procuring a rich dye, and an elegant varniſh, which is provided by a certain ſpecies of winged ant. Our fineſt red colours are alſo furniſhed by inſects. The *cochineal* inſect, the extenſive advantages of which have been long known, is propagated with care, and in vaſt numbers, in the kingdom of Mexico, and in many parts of South America. See the article Coccus, vol. iv. p. 721–724, and the correſponding engraving. The *kermes*, or grain of ſcarlet, which was formerly imagined to be one of the galls or excreſcences that are ſeen on ſhrubs, is now found to be an inſect, which attaches itſelf in that form to a ſpecies of the oak.

The medical uſes of the inſect tribes are alſo far from being inconſiderable; and to theſe objects they have long been applied. The valuable purpoſes to which the cantharides has been made ſubſervient, will alone vindicate the utility of thoſe reſearches which have been made concerning this part of the animal kingdom. There are ſtill other uſes to which inſects have been applied, and that from the moſt remote antiquity, which appear of a curious and ſingular nature. Even before the time of Theophraſtus and of Pliny, certain kinds of them were employed in ripening the figs throughout the iſlands of the Archipelago; and it appears from Tournefort, that the ſame practice ſtill ſubſiſts among the inhabitants of thoſe iſlands. There are two kinds of figs cultivated around the Mediterranean; the wild, and the domeſtic. The former produces fruit ſeveral times in the year; and in it are foſtered certain worms, which are afterwards transformed into ſmall flies. It is by the aſſiſtance of theſe little animals that the domeſtic fig is brought to maturity, which would otherwiſe drop from the tree in an unripe ſtate. During the months of June and July, the peaſants are buſily employed in collecting ſuch of the wild figs as abound moſt with theſe inſects, and in placing them near the cultivated fig, that they may co-operate with nature in bringing it to maturity. Similar purpoſes are effected by our gardeners in England, who employ the bees on their firſt coming, and ſhut them into the frames, to transfer the prolific farina of the male bloſſom to that of the female, whereby fructification is inſured, and early cucumbers produced.

But there are other inducements to the ſtudy of entomology, of a nature wholly different from thoſe already mentioned; inducements, founded not on any hope of pecuniary advantage, but of alleviating or preventing the numerous miſchiefs they occaſion. Infinite ſwarms of inſects annually deſolate whole provinces; others attack our gardens and cultivated grounds, where they commit endleſs devaſtations upon the corn, vegetables, and fruit trees. Nor are their depredations confined to the fields; they even enter the habitations of man, pierce the ſoundeſt bottoms of ſhips, and by deſtroying the timbers gradually reduce them to ruin. They injure his books and furniture, and deſtroy his clothing; ſome of them ſpare not even his perſon, tormenting it long before the period which nature has deſtined it to become their legitimate prey. Here, then, by a cloſer examination of the deſtructive powers of inſects, we ſhall have melancholy proofs of their importance in the ſyſtem of nature, and be perſuaded that however trifling they may appear, there is no claſs of animals whoſe hiſtory more nearly concerns us, and which better deſerves the attention of the naturaliſt.

There are four different ſpecies of the locuſt which are remarkably deſtructive. Almoſt every year, whole provinces, the moſt fertile in Aſia and Africa, are laid waſte by their depredation. In Tunis and Algiers, ſwarms of the *gryllus migratorius* appear ſo numerous, that they darken the face of the ſky, like a threatening cloud. Theſe pernicious animals are wafted there by the ſouthern winds in the month of April. In May they take their departure for the interior parts of the country, to propagate their young; theſe make their appearance in their larva or caterpillar ſtate, during the month of June, when they commit vaſt depredations. The firſt columns, which pervade the country like an army, deſtroy every green ſhrub and pile of graſs; and their devaſtation has not ceaſed, when they are ſucceeded by other ſwarms, that preſs upon their rear, devouring the tender branches and ſtalks of plants, which their forerunners had left. This dreadful viſitation, which the language of ſcripture has juſtly deſcribed as a plague, does not terminate till the inſects have paſſed into their winged ſtate, when they fly off, leaving the whole ſurface of the earth naked and brown, as if ſcorched by fire.—See the article Gryllus, with

with the correſponding engravings of the moſt remarkable ſpecies of locuſts.

Little inferior to the locuſt in its deſtructive powers, is the *phalæna graminis* of Linnæus, which deſtroys the meadows in Sweden. There the peaſants are employed in cutting deep ditches in the ſurface to ſtop the progreſs of the larvæ as they paſs along. If the ſwarm be ſmall, this device has the deſired effect; but the numbers of theſe animals are often ſo great, that they fill up the trenches, and paſs along over the dead bodies that are buried in them. The *formica ſacchilifera* is a native of the Weſt Indies, where it pervades the plantations of the ſugar-cane, entering the plants, and deſtroying them when they are tender: after long experience of its depredations, the inhabitants have never been able to invent a method of deſtroying this pernicious animal. In our own country, the turnip-fly, the butterfly, the chafer maggot, the corn inſect, *thrips phyſapus*, and the gooſeberry worm, have long committed depredations in the fields and gardens, which no invention has hitherto been able wholly to prevent. See the article THRIPS, and correſponding engraving of the corn inſect. Another object highly worthy the attention of the entomologiſt, is the means of preſerving corn from the invaſion of inſects, after it is collected into granarics. Our ſubſiſtence, in almoſt every ſtage of its progreſs, is conſtantly expoſed to the intruſions of theſe enemies of human induſtry. Flour, biſcuit, and almoſt every kind of proviſion, even after it is barrelled up for exportation, is liable to be devoured or rendered uſeleſs, by the depredations of the minuteſt animals. See CURCULIO, vol. v. p. 480, and correſponding engraving of the weevil, &c. The patriotiſm of ſtateſmen, and their zeal for the good of mankind, could not receive a nobler or more uſeful direction than in holding out rewards to ſuch as might diſcover the moſt effectual means of preventing the ravages of thoſe animals, which, by the moſt deſtructive activity, are continually converting large ſtores of proviſions into ſo many maſſes of corruption. If we paſs from theſe evils to other inconveniences with which inſects oppreſs the human race, we ſhall find room to commiſerate the inhabitants of many parts of the globe. What an uncomfortable life muſt the poor Laplander lead, ſince, at certain ſeaſons of the year, the number of inſects is ſo great, that a candle is no ſooner lighted than the flame is extinguiſhed by the multitudes that flock to it; where, after millions are deſtroyed, famiſhed millions ſucceed, and renew the unceaſing combat. Leſs injurious, though equally tormenting, are the muſquetos which infeſt the warm climates of Aſia and South America. Even in Britain, which is happily free from theſe unrelenting invaders, much inconvenience is often felt from the ſting of the hornet, the waſp, and the bee; and almoſt as bad from filthy vermin, eſpecially the bug. See the articles CIMEX, vol. iv. p. 598, and CULEX, vol. v. p. 461—463, with the copper-plates of thoſe various inſects. To counteract theſe inveterate enemies of man, and to relieve him from the miſchiefs they occaſion, ought always to be one aim of the entomologiſt: and no perſon will deny, that whoever, by the ſtudy of inſects, has found the means of availing himſelf of the labours of ſuch as are uſeful, or prevent the noxious from doing harm, hath rendered an eſſential ſervice to mankind.

After what has been ſaid, it may appear ſingular, that the ſtudy of entomology was very long before it attracted any conſiderable degree of attention from men of learning. Ariſtotle, the father of naturaliſts, has allotted but a ſmall portion of his works to the hiſtory of inſects; nor does it appear that he has been always ſufficiently attentive to the authorities upon which he inſerts the different facts he relates, or to the order in which they are arranged. The hiſtories of Pliny and Ælian are formed upon the ſame plan, and are liable to ſimilar defects: they conſiſt of a number of obſervations, ill arranged, and inſufficiently authenticated.

During that long ſucceſſion of ages, which was only diſtinguiſhed by ignorance and barbariſm, entomology ſhared the ſame fate with every other ſcience: it was condemned to oblivion. After a taſte for literature had begun to revive, the hiſtory of inſects again attracted the notice of the curious; unhappily, however, for the growth of ſcience, men were then devoted to the ſtudy of the ancients with a blind admiration. It was from their writings that they imagined the moderns were to derive a complete knowledge of all the ſecrets of nature; and Ariſtotle was principally conſulted for the hiſtory of animals. Had Aldrovandus, Geſner, and Mouffet, beſtowed the ſame attention in ſtudying the works of nature, that they employed upon the writings of ancient authors, they would have made a much greater progreſs in real knowledge. The attempts of theſe writers, however, gave birth to the reſearches of others, who were gradually more bold and ſucceſsful, in proportion as their reverence for antiquity was diminiſhed. In 1668, about twelve years after Mouffet publiſhed his *Theatrum Inſectorum*, the experiments and obſervations of the celebrated Rhedi made their appearance in Italy. His inveſtigations were principally directed to the manner of the generation of inſects, with a view to overthrow that abſurd and erroneous doctrine eſtabliſhed by the ancients, of their ariſing fortuitouſly from different bodies in a ſtate of putrefaction. Nothing can more fully demonſtrate the ſtrength of prejudice than thoſe elaborate treatiſes which Malpighi, Swammerdam, and Rhedi, were obliged to compoſe, in order to combat the notion of the ſpontaneous generation of inſects; an opinion which at preſent ſeems as ridiculous and unphiloſophical as it is untrue. Notwithſtanding all their efforts to prove, that the ſmaller animals are produced in the ſame manner with the larger, and that the organization of the body of a mite requires the ſame apparatus of limbs, and the ſame complete ſtructure of parts, as that of an elephant, attempts were ſtill made to revive the ancient error by Kirker, Bonarie, and others. And what is moſt mortifying to human reaſon, the ſame Rhedi, the declared enemy of prejudices, and the man of all others who knew beſt how to combat them, has, upon this very ſubject, fallen into a ſimilar error. In order to produce thoſe inſects which are found upon the ſmall excreſcences of plants and trees, he conferred a vivifying power, a kind of ſoul, upon thoſe vegetables where they were found, and thus laid aſide the ordinary mode of generation, which in other inſtances he had laboured to eſtabliſh.

Swammerdam was the contemporary of Rhedi; and, like him, he poſſeſſed the courage to examine nature, and think for himſelf. This naturaliſt made many anatomical experiments upon inſects, which after his death were publiſhed at Leyden, and laid the foundation of great improvements in entomology. About the ſame period, Mary Sibille Merian, a Dutch lady, contributed largely to bring the hiſtory of inſects into repute, by the beauty of her paintings and drawings. After having executed elegant figures of ſeveral of the inſects of Europe, from a ſingular avidity for entomology ſhe was prompted to croſs the Atlantic, and give paintings of many of thoſe in South America. Having reſided for ſeveral years in Surinam, ſhe returned to Europe with exquiſite drawings of many of the ſplendid inſects of that continent, which were afterwards engraved and publiſhed in Holland; and her work, with the original drawings, are now preſerved as objects of real curioſity in the Britiſh muſeum. From theſe are given many of the beſt engravings which illuſtrate THIS work.

Goedart is another of the firſt authors who adorned the hiſtory of inſects with the labours of the pencil. He paid great attention to the metamorphoſes of the animals, and has painted many of them in the ſeveral forms which they aſſume, from their appearance till their death. His work was originally publiſhed in German, very badly arranged; a new edition in Latin was afterwards given by Dr. Liſter,

in

in which many errors were corrected, and a new arrangement made out by that able naturaliſt, who has himſelf written a valuable treatiſe upon the intricate genus of ſpiders. Some of theſe authors, by the extent of their labours, and others by the boldneſs of their genius, had convinced mankind that the ancients were far from attaining that perfect knowledge of nature which they had hitherto imagined. They were now ſo far emboldened by the progreſs they had made, that they truſted to their own judgment and obſervation in examining the works of nature; and many productions far more judicious, accurate, and philoſophical, were offered to the public, than had ever before appeared. Among the firſt of theſe may be ranked that of our celebrated countryman, Mr. Ray, who had, for the greater part of his life, aſſiduouſly examined the economy of inſects. His *Methodus Inſectorum* was not publiſhed till after his death in 1710, and was then the moſt accurate and conciſe performance on the ſubject of entomology. In the meanwhile, there appeared a numerous liſt of authors who treated this claſs of the animal kingdom; Albin deſcribed the inſects of England, while ſir Hans Sloane, Petiver, Cateſby, and Friſch, have detailed the hiſtory of vaſt numbers of exotic animals of this tribe.—In this ſtate of the ſcience, about the year 1754, appeared M. de Reaumur, by far the moſt laborious and indefatigable entomologiſt then in Europe. Almoſt in every part of France this naturaliſt had correſpondents ſtationed to tranſmit him deſcriptions and ſpecimens of every curious inſect that might occur. And in order to examine their inſtincts, their transformations, and mode of generation, he incloſed vaſt numbers of them in a large aviary, conſtructed with a cloſe net, and ſecured below with a pavement overlaid with green turf, and planted with ſhrubs and different kinds of plants. It was there that this unwearied obſerver of nature examined the manners and economy of thoſe inſects, which he has deſcribed in one of the moſt voluminous works that has appeared on entomology. As a writer, he is extremely diffuſe, but always entertaining and inſtructive. The principal defect in his work is the want of a ſyſtematic arrangement, and the ſynonyma of other authors; a precaution that was alone able to have prevented confuſion in ſo large a performance, and amid the vaſt number of inſects which he has deſcribed. Theſe defects, however, were ſoon after remedied by the excellent claſſification of the illuſtrious Swede, whoſe ſyſtem will probably long continue to be a ſtandard to all thoſe who ſhall hereafter attempt to enlarge the boundaries of natural hiſtory.

Since 1715, when the Syſtema Naturæ was firſt publiſhed by ſir Charles Linnæus, various improvements were made on it by that author, who enjoyed the rare felicity, not only of ſeeing his works gain univerſal approbation, but of many opportunities of bringing them nearer to perfection. In the mean time Geoffroy, Scopoli, Wotton, Harvey, Valiſnieri, and many others of conſiderable note, turned their attention to this intereſting part of natural hiſtory; and while they have endeavoured to improve upon the arrangement of the Swediſh naturaliſt without ſucceſs, have nevertheleſs added greatly to the known ſpecies of inſects. Among this number De Geer, a Swediſh nobleman, counſellor to the king, may be ranked in the firſt ſtation: he has publiſhed a large treatiſe upon this ſubject, in which he has not only deſcribed a great number of inſects with accuracy, but has indulged in philoſophical remarks upon their hiſtory, which poſſeſs very conſiderable merit. For correct claſſification, however, and an enumeration of all the ſpecies of inſects at preſent known, Dr. Gmelin's edition of Linnæus, 1793; the Syſtem of Entomology, by Fabricius, 1795; and Dr. Turton's tranſlation of Gmelin, 1800, are by far the moſt complete.—Beſides theſe, a number of entomologiſts have appeared, who have given moſt elegant engravings of inſects; among which are, Knorr, Roeſel, Seba, Leeuwenhoek, Fueſsly, Muller, Cramer, Pallas, Baker, Barbut, Harris, Wilkes, Latreille, Paykull, Coquebert, Boſch, Friſch, Clairville, Detigny, and particularly Drury. Some of theſe have improved this ſcience by microſcopical obſervation: the laſt elegant improvement of which has been recently given by Kanmacher, in his new edition of Mr. Adams's Hiſtory of Inſects, illuſtrated by the miſcroſcope.

Whether we turn our attention to a hot or a cold climate, it is probable that the number of inſects in every country is greater than that of plants. In Sweden there have been enumerated, and pretty accurately deſcribed, about one thouſand ſeven hundred inſects, while the number of plants, though no where more accurately examined than in that kingdom, do not exceed thirteen hundred.—In the neighbourhood of Paris, there have been diſcovered by Geoffroy and Reaumur, upwards of one thouſand four hundred inſects, while the plants of the ſame diſtrict, which have been ſtill more accurately examined than the inſects, do not nearly amount to that number.—The Britiſh inſects have never yet been either fully enumerated, or accurately deſcribed; although the plants of this iſland have been pretty accurately aſcertained, by the indefatigable induſtry of Dr. Withering. Dr. Berkenhout, in his outlines of the natural hiſtory of this iſland, has enumerated five hundred and ſeventy-two different ſpecies. In all probability, a more complete inveſtigation would diſcover three, or perhaps four, times, that number of Britiſh inſects. The nearer any country approaches to the equator, the more numerous will the inſect tribes be found. In theſe northerly climes, however, there is ſtill much room left for entomological inveſtigation and enquiry.

The different operations which inſects are obſerved to perform, oblige the naturaliſt to aſcribe to them a certain degree of intelligence. Yet the various proceſſes through which they paſs are ſo uniform, and that ſucceſſion of actions which we ſee them exhibit are ſo little varied, that nature ſeems to have deſtined them to act a ſubordinate part in the great republic of animals. If their hiſtory ſometimes repreſents them varying their procedure, and accommodating themſelves to circumſtances, the ſphere of their addreſs ſeems to be confined within narrow limits; and it is ſeldom that they attract our admiration by any unuſual efforts of ſagacity. The bee and the ant repreſent ſtriking inſtances of aſſiduity in labour; they have, however, but one ſingle method of operating, and, withdrawn from that, can turn to no other. A bee taken out of the hive is totally helpleſs and inactive; far from diſplaying the ſagacity of the dog, it ſeems incapable of giving the ſmalleſt variation to its inſtincts. In the purſuits of the latter animal, there appears ſomething like choice; in the labours of the former, the whole appears like neceſſity or compulſive inſtinct.

The amazing number of inſects is another argument of their inferiority in the ſentient principle. It is a rule which obtains among the offſpring of nature, that the nobler animals are ſlowly produced, and that, in forming theſe, ſhe acts with a dignified economy; while, in her meaner births, ſhe is often laviſh to profuſion; and thouſands of the more ignoble kinds are produced merely to ſupply the neceſſities of the more favoured and highly organized parts of her creatures. From theſe conſiderations, we are induced to believe, that the degree of intelligence allotted to this claſs of the animal kingdom is but ſmall; and our experience, as far as it goes, coincides with this opinion. While other animals are capable of ſome degree of education, theſe have one invariable mode of operating, which no art can either alter or improve. The dog is taught to carry; the bird to ſing a tune; but thoſe inſects which may be conſidered as completely domeſticated, can by no invention be turned from their inſtinct. The ſilkworm completes its labours, and the ſpider conſtructs its web invariably in the ſame manner. An exiſtence which continues but a ſingle ſeaſon, ſeems too ſhort for the purpoſes of inſtruction, or of learning. Hence the inſects are not only of a rank inferior to the larger animals, but are more nearly allied to the *vermes*,

than to the claſſes above them. Many are attached to one vegetable, ſome to a ſingle leaf, where the period of their lives is completed in a few weeks, or perhaps a few days or hours; and where the pleaſures they enjoyed, or the purpoſes for which they were produced, are in a great meaſure beyond the reach of our faculties to explore.

Of the PARTS of INSECTS.

An inſect is defined to be, an animated being deſtitute of bones; but which, inſtead thereof, is covered with a very hard ſkin which ſupplies the place of oſſification; has ſix or more feet; and breathes through ſpiracula, or pores placed in the ſide of the body: yet inſects are very diſtinct from, and muſt not be confounded with, *vermæ* or worms. Quadrupeds, birds, and fiſhes, have all an internal ſkeleton of bones, to which the muſcles are affixed; but the whole interior of inſects is compoſed of ſoft fleſh, and the muſcles are attached to an external ſhell, which ſerves the double purpoſe of ſkin and bone, completely exemplified in the crab and lobſter.—See the article CANCER, vol. iii. p. 704—707.

Inſects are divided into four principal parts: the *caput*, or head; the *thorax*, or trunk; the *abdomen*, or belly; the *artus*, or limbs. The HEAD is affixed to the thorax by a ſpecies of articulation or joint; it is the principal ſeat of the ſenſes, and, as proved by Fabricius, contains the rudiments of the brain; it is furniſhed with a mouth, eyes, antennæ, a forehead, a throat, and ſtemmata. In the greater part of inſects the head is diſtinctly divided from the thorax, but in others it coaleſces with it. The head of ſome inſects is very large compared with the ſize of their bodies; the proportion between the head of the ſame inſect is not always ſimilar; in the caterpillars with horny heads it is generally ſmall, before they moult or change their ſkin, but much larger after each moulting. The hardneſs of the exterior part of the head prevents its growth before the change; it is, conſequently, in proportion to the body very ſmall; but when the inſect is diſpoſing itſelf for the change, the internal ſubſtance of the head retires inwards to the firſt ring of the neck, where it has room to expand itſelf; ſo that when the animal quits the ſkin, we are ſurpriſed with a head twice the former ſize; and, as the inſect neither eats nor grows while the head is forming, there is this further circumſtance to be remarked, that the body and the head have each their particular time of growth: while the head expands and grows, the body does not grow at all; when the body increaſes, the head remains of the ſame ſize, without any change.

Os, the mouth, is a part of the inſect to which entomologiſts will find it neceſſary to pay a very particular attention. Fabricius goes ſo far as to aſſert that, without a thorough knowledge of the mouth, its form, and various appendages, it will be impoſſible to diſcriminate with accuracy one inſect from another. In the ſtructure of the mouth conſiderable art and wiſdom is diſplayed; the diverſity of the figure is almoſt as great as the variety of ſpecies. It is uſually placed in the forepart of the head, extending ſomewhat downwards: in the chermes, coccus, and ſome other inſects, it is placed under the breaſt. In ſome inſects, the mouth is forcipated, to catch, hold, and tear, the prey; in others, aculeated, to pierce and wound animals, and ſuck their blood; in others, ſtrongly ridged jaws and teeth, to gnaw and ſcrape out their food, carry burdens, perforate the earth, nay the hardeſt wood, and even ſtones, for habitations and neſts for their young. Others are furniſhed with a kind of tube, at one time moveable, at another fixed, with which they ſuck the jnices of the flowers.

Maxillæ, the jaws, are generally two in number; in ſome, four; in others, more. They are ſometimes placed in an horizontal, ſometimes in a tranſverſe, direction; the inner edge is ſerrated, or furniſhed with ſmall teeth, as in the cicada, nepa, notonecta, cimex, aphis, and remarkably ſo in ſome curculeones. They move the jaws from right to left, not up and down, but ſideways.

The *roſtrum*, or proboſcis, is a very curious and complicated organ; it is the mouth drawn out to a rigid point. In many inſects of the hemiptera claſs, it is bent down towards the breaſt and belly. It has by ſome writers been conſidered as ſerving at once the different purpoſes of mouth, noſe, and windpipe, enabling the inſect to extract the juices of plants, communicate the ſenſation of ſmelling, and convey air to the body.

Lingua, the tongue, is a taper and compact inſtrument, by which the inſect obtains the juices of plants. Some can contract or expand it, others roll it up with dexterity; in ſome it is incloſed within a ſheath. It is taper and ſpiral in the butterfly, tubular and fleſhy in the fly; in all affording under the microſcope, a moſt ſingular diſplay of curious mechaniſm. Swammerdam, when ſpeaking of the proboſcis of the butterfly, is full of admiration: "I cannot refrain, (ſays he,) from confeſſing to the glory of the Immenſe and Incomprehenſible Architect, that I have but imperfectly deſcribed and repreſented this ſmall organ; for, to repreſent it to the life in its full perfection, as truly moſt perfect it is, far exceeds the utmoſt efforts of human knowledge." Reaumur breaks out into ſimilar expreſſions, on deſcribing the proboſcis of the bee, with which they take their nouriſhment, and collect the honey. See this inſtrument deſcribed and figured under APIS, vol. i. p. 796. The proboſcis of the bee is ſhaped like a barbed javelin, but that of the butterfly is a ſpiral ſubſtance, ſomewhat reſembling the ſpring of a watch when wound up; as may be ſeen in the butterfly, in the Entomology Plate I. fig. 6. By means of a pin it can be gently pulled out to its full length; it grows gradually tapering from the baſe, at the end it divides or ſeparates into two tubes, each furniſhed with little organs of ſuction; probably, it is by theſe that it extracts the juices on which it feeds, and not by the extreme ends of the tongue. As the butterfly has no mouth, the proboſcis is the only alimentary organ; when ſeparated from the inſect, it will often unroll itſelf, then wind and coil itſelf up again, continuing theſe motions at intervals for a conſiderable time.

The proboſcis of the tabanus, or ox-fly, is alſo of a very ſingular and curious ſtructure. The whole apparatus is compoſed of ſix parts, excluſive of the two guards or feelers, all of which are incloſed in a fleſhy caſe, which opens at the will of the animal, and lets out its weapon, whenever diſpoſed to pierce the hides of cattle, and ſuck their blood. But the moſt ſingular and curious conformation of a proboſcis, if it may be ſo called, is the inflated projection of the head of the lanthorn-fly, which, in luminous ſplendour, ſo far exceeds the refulgence of the glow-worm, as to enable the inhabitants of South America to read by its light, and travellers are even ſaid to be directed on their journey, by fixing one or two of them to the end of a ſtick. See their natural hiſtory, and an engraving of them, under FULGORA, vol. vii.

ANTENNÆ.—Theſe are fine ſlender horns, conſiſting of ſeveral articulations, moveable in various directions, and conſtituting one of the diſcriminating characteriſtics of inſects. They are beautiful in form, and of a very delicate ſtructure, ſo finely articulated, and ſo minutely jointed, as to be inſtantaneouſly moveable in every direction. They are ſituated on the fore part of the head. The ſhape, the length, the number, and kind of articulations, not only vary in different ſpecies, but the antennæ of the male generally differ from thoſe of the female. The greater number of inſects have only two antennæ, but the oniſcus, the pagurus, and aſtacus, have four. Regular rows of minute holes are obſervable in the antennæ, which are ſuppoſed to be naſal apertures, poſſeſſing the faculty of ſcent. Several inſects cover their eyes with the antennæ, while they ſleep. But we are far from being certain of the poſitive uſe of this inſtrument: ſome writers have merely conjectured that they are the organs of ſmell

and

and of hearing, others have ſuppoſed them appropriated to a delicate kind of feeling, ſenſible to the leaſt motion or diſturbance in the circumambient fluid in which they move. It is very reaſonable to ſuppoſe they are the organs of ſmelling, ſince we evidently find that many inſects poſſeſs this ſenſe in a very exquiſite degree, and yet we ſee no external organs except theſe to ſerve that purpoſe. The following obſervations may ſerve to throw ſome light on this obſcure ſubject. When a wingleſs inſect is placed at the end of a twig, or in any other ſituation where it meets with a vacuity, it moves the antennæ backward and forward, elevates and depreſſes them from ſide to ſide, and will not advance further leſt it ſhould fall. Place a ſtick or any other ſubſtance near the antennæ, and the inſect immediately applies them to this new object, ſeems to examine whether it be ſufficient to ſupport its weight, and then proceeds on its journey. From theſe obſervations it would appear that the antennæ aſſiſt the inſect in judging of the vicinity of objects, and probably enable them to walk with ſafety in the dark.

That theſe obſervations are not, however, concluſive, appears from an experiment of a very ingenious naturaliſt: being deſirous of aſcertaining the nature and uſe of the antennæ and proboſcis of a butterfly, he gently approached one that was flying about in ſearch of food; he obſerved that it turned the antennæ about every way, till coming within ſcent of a flower, it kept them fixedly bent toward that object, directing its courſe by their guidance, till it arrived at the flower; there they appeared to act as an organ of ſmell, and that the minute holes with which it is furniſhed aſſiſted in promoting this operation. When the creature had reached the flower, it hovered over it as with rapture, poiſing itſelf quietly upon wing, like a kite or hawk in the air; it then dropped ſuddenly, till it was on a level with the flower, when it began to agitate its wings briſkly, and to unroll its ſpiral trunk, thruſting it to the bottom of the flower; in a little time the trunk was rolled up, and again in a moment unrolled; theſe operations it repeated till the flower yielded no more juices, the butterfly then ſought for and alighted on another. But after all, this ſubject muſt for the preſent remain undecided. Indeed, the bodies of inſects are throughout formed of parts ſo different from ours, that we can probably conceive no more idea of the uſe of ſome of their organs, than a man born blind or deaf can of the ſenſes of viſion or hearing. They may have ſenſes different from ours, and theſe may be the inſtruments of them. The differences in the form and conſtruction of the antennæ, are diſtinguiſhed in entomology by the following names:—*Setaceous*, are thoſe formed like a briſtle, gradually tapering towards the point or extremity, as in many of the phalenæ. *Filiform*, are thread-ſhaped, and of an uniform thickneſs. *Moniliform*, are alſo of a regular thickneſs, but are made up of a ſeries of minute knobs, reſembling a necklace of beads, as in the chryſomela. *Clavate*, formed like a club, increaſing gradually from the baſe to the extremity, as in the papilio, or butterfly. *Capitate*, alſo formed like a club, but the laſt articulation is larger than the reſt, finiſhing with a kind of knob or head. *Fiſſile*, are like the former, only that the capitulum or knob is divided longitudinally into three or four parts or laminæ, as in the ſcarabæi. *Perfoliate*, are alſo capitated, but have the knob divided horizontally, and the laminæ connected by a kind of thread paſſing through their center, as in the dermeſtes and dytiſcus. *Pectinate*, ſo called from their ſimilitude to a comb, though they more properly reſemble a feather, as in the phalenæ and elateres; this is moſt obvious in the male. *Ariſtate*, are ſuch as have a lateral hair, which is either naked, or furniſhed with ſmaller hairs, as in the fly.—Beſides the foregoing terms, the antennæ are called *breviores*, or ſhort, when they are ſhorter than the body; *mediocres*, or middling, when they are of the ſame length; and *longiores*, when they are longer.

Near the mouth there is alſo a ſpecies of ſmall filiform articulated antennæ, called the *palpi*, or feelers; they are generally four in number, ſometimes ſix; they are placed under and at the ſides of the mouth, which ſituation, together with their ſize, ſufficiently diſtinguiſh them from the antennæ; they are in continual motion, the animal thruſting them in every matter, as a hog would its noſe, when in ſearch of food. Some have ſuppoſed them to be a kind of hand to aſſiſt in holding the food when it is near the mouth.

Eyes.—The ſtructure of the eye has always been conſidered as a wonderful piece of mechaniſm; the admirable manner in which thoſe of the human ſpecies are formed, and the nature of viſion, are ſpeculations which cannot but excite the attention of every inquiſitive mind. The eyes of inſects, though they differ conſiderably in their conſtruction from thoſe of other animals, are no leſs worthy of our admiration. Indeed, among the exterior parts of inſects, none are more deſerving of minute inveſtigation, and very few perſons are to be found, who can be inſenſible to the beauties of this organ when exhibited under the microſcope; which is the only means of diſcovering the prodigious art employed in their organization, and evidently ſhews how many curious objects eſcape the unaſſiſted ſight. The conſtruction of the eye in inſects is not only diſtinct from that of other animals, but alſo differs in different ſpecies. They vary in number, ſituation, connection, and figure. In other creatures the eyes are moveable, and two in number, one on each ſide of the head: in inſects, the genus of cancri excepted, the eyes are fixed; they have no eye-brows, but the outer coating is hard and tranſparent. The greater part of inſects have two eyes; in the monoculus they approach ſo near to each other, as to appear like one; the gyrinus has four eyes, the ſcorpion ſix, the ſpider eight, and the ſcolopendra three. Of theſe eyes ſome have them ſingle, that is, placed in facets at a ſmall diſtance from each other; while others are furniſhed with an indefinite number of lenſes all placed in one common caſe or ſocket; and termed *reticulated* eyes. Theſe appear like protuberances on the heads of inſects, and we can perceive that they conſiſt of a number of lines croſſing each other like the meſhes of a net. By this we know that they are reticulated ſubſtances; but in what manner they are ſo, can only be ſhewn by the microſcope.

The eyes of the *libellula*, or dragon-fly, are divided into a number of hexagonal cells, each of which forms a complete eye. The external parts of theſe eyes are ſo perfectly ſmooth, and ſo well poliſhed, that, when viewed as opake objects, they will, like ſo many mirrors, reflect the images of all the ſurrounding objects. The figure of a candle may be ſeen on their ſurface multiplied almoſt to infinity, ſhifting its beam to each eye, according to the motion given by the hand of the obſerver. Other creatures are obliged to turn their eyes towards the object they deſire to ſee; but inſects have eyes directed thereto, on whatſoever ſide it may appear; they more than realize the romantic accounts of fabulous hiſtory: poets gave to Argus an hundred eyes; inſects are furniſhed with thouſands, having the benefit of viſion on every ſide with the utmoſt eaſe and ſpeed, though without any motion of the eye, or flexion of the neck. Each of theſe protuberances, in its natural ſtate, is a body cut into a number of faces, like an artificial multiplying glaſs; but with this ſuperiority in the workmanſhip, that, as there every face is plane, here every one is convex, immenſely more numerous, and contained in a much ſmaller ſpace. Each of the eyes is an hexagon, varying in ſize according to its ſituation in the head, and each of them is a diſtinct convex lens, and has the ſame effect in forming the image of an object placed before it.

Hooke, Catalan, and other entomologiſts, have ſhewn that theſe ſmall eyes are furniſhed with every requiſite of viſion, and that each of them has the uſe, the power, and properties, of an eye. But we muſt have recourſe to the works of Swammerdam for a full account of the aſtoniſhing

organization of the eyes of infects. Among other things, he has fhewn, that under each facet there is a pyramid of fibres broad at the bafe, and growing fmaller as it proceeds inwards; the pyramid has the fame number of fides as the eye, and there are as many hexagonal pyramids, as there are fmall facets or eyes in the infect. An innumerable number of pulmonary tubes afcend thefe fibres, terminating in a white fibrous convex membrane; under thefe membranes there is another, ftill more delicate and tranfparent; beneath this, a fecond fpecies of fibres is tranfverfely applied, like fo many beams to fupport the pyramids that are laid upon them. Still we cannot determine with certainty, how thefe numerous inlets to fight operate for the fervice of the animal; they may increafe the field of view, augment the intenfity of light, and be productive of advantages of which we can have no conception. Hooke computed 14,000 of thefe facets in the two eyes of a drone; Leeuwenhoek reckoned 6036 in the two eyes of a filkworm, when in its fly ftate; in the eyes of the libellula he reckoned 12,544 hexangular lenfes. Swammerdam covered the reticulated eyes of certain infects with black paint; in this ftate they flew at random, and feemed to be deprived of their ftrength; when they fettled, they did not avoid the hand that was going to take hold of them. Reaumur made fimilar experiments on the eyes of bees, which concurred with thofe of Swammerdam.

Some ephemera flies have four reticulated eyes, two of which are placed as in the common fly; the other two are placed, one befide the other, upon the upper part of the head, and have the appearance of a kind of mufhroom, the head extended fomewhat beyond the ftalk. The firft pair are of a brown colour, thofe of the mufhroom form are of a very beautiful citron colour. In many of the fly clafs, thefe reticulated eyes are little inferior in colour and brilliance to the brighteft gem. The colour varies in different fpecies; in fome we find it green, in others red, &c. fome have a moft elegant changeable colour thrown over them, partly purple, partly green, and partly of that braffy hue which is feen on the backs of fome of the beetles, and which is not equalled by any other production of art or nature.

It might be imagined, that as every fly has two reticulated eyes, they could not have occafion for more; but fo it has not appeared to that Great Being who formed them, for many are furnifhed befides with other eyes, differing in form and conftruction from thofe that are reticulated. Thefe were firft noticed by M. de la Hire; they are three lucid protuberances placed on the back part of the head of many infects; their furface is glofly, of an hemifpheric figure, and a coal-black colour. They are tranfparent, and difpofed in a triangular form; by modern entomologifts they are termed *ftemmata*. Reaumur made experiments upon thefe eyes, fimilar to thofe he had made on the reticulated ones, and found that when the ftemmata were covered with dark varnifh, the infects flew but to a fmall diftance, and always at random. No infect feems to poffefs both kind of eyes, unlefs in its perfect ftate: there are many fpecies which are not furnifhed with ftemmata, gnats and tipulæ are without them. But the moft extraordinary conftruction of the eye perhaps in the whole tribe of infects, is that of the *diopfis*, or fpectacle-fly. In this infect the eyes are placed on the extremity of two long, folid, inarticulate, filiform horns; the extremities of which form a kind of focket to receive the eyes, which are fpherical, and lucid black. See the article DIOPSIS, and the engraving of the fly, vol. v. p. 842.

BODY.—The trunk or body of the infect is fituated between the head and abdomen. Entomologifts divide it into three parts: the thorax, fcutellum, and fternum. The *thorax* is the part of the body next the head, and is of various fhapes and proportions; the fides and back of it are often armed with points. The *fcutellum*, or efcutcheon, covers the part between the thorax and abdomen, and is generally of a triangular form; though it adheres to the thorax, it is eafily diftinguifhed from it by its figure, and often by an intervening future. It feems intended to affift in expanding the wings. The *fternum* is fituated on the under part of the thorax; in fome fpecies it is pointed behind, as in the elateres; in others, bifid, as in fome of the dytifci. In fhort, the thorax is the ftomach of infects; and is either round, triangular, cylindrical, thick, ftender, &c. It may be confidered as compofed of fix faces, like a cube, which form it fometimes aflumes, and is often terminated by a kind of border, and then called *marginated*.

ABDOMEN.—The abdomen contains the inteftines, airveffels, &c. It is compofed of feveral corneous rings or fegments, fo that it may be moved in various directions, or lengthened and fhortened at pleafure; in fome it is formed of one piece only. It is perforated with fpiraculi, or breathing holes, and is terminated by the tail. The *fpiraculi* are fmall oblong holes or pores placed fingly one on each fide of every ring or fegment; thefe are the means or inftruments of refpiration, which fupply the want of lungs, and form a peculiar characteriftic of infects. The organs of generation are placed in the extremity of the abdomen.

LIMBS.—By the limbs are meant the inftruments ufed by the infect both for motion and defence. They are, *alæ*, the wings; *halteres*, the poifers; *pedes*, the legs; *cauda*, the tail; and *aculeus*, the fting.

The *wings* are thofe inftruments by which the infect is enabled to fly; fome have only two, others are furnifhed with four, two on each fide; thefe are, in fome, of the fame fize; in others, the fuperior ones are much larger than the inferior: Linnæus has made them the foundation of the feven orders into which he has divided this numerous clafs of beings. The variety in the form and ftructure of the wings is almoft infinite; the beauty of their colouring, the art with which they are connected to the body, the delicate manner in which fome are folded up, the fine articulations provided for this purpofe, by which they are laid in their cafes when out of ufe, and yet ready to be extended in a moment for flight, afford an inexhauftible fund of curious inveftigation. The wings of moths and butterflies are moftly farinaceous, covered with a fine duft, which, by the affiftance of the microfcope, appears to be a regular affemblage of organized fcales.

The following terms are applied to the different kinds of wings. They are firft diftinguifhed, with refpect to their furfaces, into fuperior and inferior. The part next the head is called the anterior part; that nearer the tail, the poferior part. The interior part is that next the abdomen; the exterior part is the outermoft edge. Thofe wings are termed *plicate*, which are folded when the infect is at reft, as in the wafp. *Plane*, when incapable of being folded. *Erect*, when the fuperior furfaces are brought in contact when the infect is at reft, as in the ephemera, papiliones, &c. *Patent*, if extended horizontally when the infect is at reft, as in the phalænæ geometræ. *Incumbent*, if when they are not in motion, they cover horizontally the fuperior part of the abdomen. *Deflexed*, are alfo incumbent, but not horizontally, when the outer edges decline towards the fides. *Reverfe*, are alfo deflexed, with this addition, that the edges of the inferior wings project from under the anterior part of the fuperior ones. *Dentate*, when with ferrate or fcolloped edges. *Caudate*, when the fibres of the wings are extended beyond the margin into a kind of tail. *Reticulate*, when the veins or membranes of the wings put on the appearance of net-work.

The wings are further diftinguifhed by their ornaments: when painted with fpots, *maculæ*; bands, *fafciæ*; ftreaks, *ftrigæ*: when thefe are extended lengthways, they are called lines, *linæ*; and if with dots, *punctæ*; one or more rings or fpots are termed eyes, *ocelli*; if the fpots are fhaped like a kidney, they are termed *ftigmata*. Thefe fpots or eyes are moft common to the wings of the butterfly.

The *elytra*, or cruftaceous fhells or cafes of the wings,

are extended when the inſect flies, and ſhut when it reſts, forming a longitudinal future down the middle of the back; they are of various ſhapes, and diſtinguiſhed by the following names:—*Abbreviate*, when ſhorter than the abdomen. *Truncate*, when their extremities terminate in a tranſverſe direct line. *Faſtigiate*, when of equal or greater length than the abdomen, and terminating in a tranſverſe line. *Serrate*, or *toothed*, having their external margins edged with teeth or notches. *Spinoſe*, when their exterior ſurfaces are covered with ſmall ſharp points. *Scabrous*, when very rough. *Striate*, when marked with ſlender longitudinal furrows. *Porcate*, having ſharp longitudinal ridges. *Sulcate*, with deep furrows. They are likewiſe diſtinguiſhed by the denomination of *hemelytra*, when their caſes are neither ſo hard as the elytra, nor ſo delicate as the tranſparent wings.

Under the wings of moſt inſects which have only two, there is a ſmall head placed on a ſtalk, frequently under a little arched ſcale; theſe are called *halteres*, or poiſers; they appear to be rudiments of the hinder wings: it has been ſuppoſed that they ſerve to keep the body in equilibrio when the inſect is flying.

The elytra, or exterior caſes, are much harder and more opake than the wings under them; they are generally highly poliſhed, and often enriched with various colours, adorned with ornamental flutings, and ſtudded with brilliants, whoſe beauties are beyond deſcription. All theſe ornaments are united in the *curculio imperialis*, or diamond beetle, one of the richeſt and moſt magnificent creatures in nature; the head, the wings, the legs, &c. are curiouſly beſet with ſcales of a moſt ſplendid appearance, outvying the ruby, ſaphire, and emerald, forming, under the microſcope, one of the moſt noble phenomena that the colours of light can exhibit. It is ſaid, that in the Brazils, from whence they come, it is almoſt impoſſible to look at them on a funny day, when they are flying in little ſwarms, ſo great is the glowing ſplendour of their heightened colours. For the figure and natural hiſtory of it, ſee the article CURCULIO, vol. v. p. 480.

The ſtrength and hardneſs of the elytra are admirably adapted to the various purpoſes of the inſects to which they are appropriated; at the ſame time that they protect the tender wings beneath them, they ſerve as a ſhield to the body; while the ribs, and other prominences, contribute to leſſen the friction and diminiſh the preſſure to which they are often expoſed. In moſt of theſe inſects, the under wing is longer and larger than the exterior ſhell, ſo that it is obliged to be bent and folded up, in order to lie under the elytra; for this purpoſe they are furniſhed with ſtrong muſcles, and proper articulations to diſplay or conceal them at pleaſure. The united ſtrength and ſplendour of the elytra may be pleaſingly contemplated by referring to that noble inſect the *cerambyx giganteus*, exhibited in the engraving oppoſite CERAMBYX, vol. iv. p. 34.

The wings of moths and butterflies are moſtly imbricate or farinaceous, being covered with a fine duſt, which renders them opake, and produces thoſe beautiful and variegated colours by which they are ſo richly adorned, and ſo profuſely decked. If this be wiped off, we find the naked wing to conſiſt of a number of ribs, like thoſe in the leaves of plants, but of a cruſtaceous nature; the largeſt rib runs along and fortifies the exterior edge of the wing; the interior edge is ſtrengthened hy a ſmaller veſſel or rib. The ribs are all hollow, by which means the wing, though comparatively large, is very light. The The membrane between the ribs, which conſtitutes the body of the wing, is ſurpriſingly thin and tranſparent; and as this is extremely tender, one uſe of the ſcales may be to protect it from injuries. When the moth emerges from the chryſalis, the wings are ſoft and thick, and if they be examined in that ſtate, will be found to conſiſt of two membranes, that may be raiſed up and ſeparated, by blowing between them with a ſmall tube: the ribs lie between theſe membranes. With the aſſiſtance of glaſſes we diſcover certain ſtrait and circular rows of extremely minute holes, running from rib to rib, or forming figures in the intermediate ſpaces, which ſeem to anſwer to the figures and variegations on the complete wing, and are probably the ſockets for the ſtalks or ſtems of the ſmall ſcales.

LEGS.—Theſe are found to vary greatly in different inſects. The moſt general number is ſix; many of the claſs aptera have eight, as the ſpider; the hornet has ten; the oniſcus or wood-louſe fourteen; the julus has from ſeventy to one hundred and twenty on each ſide. The legs of thoſe inſects that have not more than ten, are affixed to the trunk, while thoſe that exceed that number, have part fixed to the trunk, the reſt to the abdomen. The legs of inſects are divided into four parts. The firſt, which is uſually the largeſt, and connected to the body, is called the *femur*; the ſecond, or *tibia*, is joined to the former, and is commonly of the ſame ſize throughout, and longer than the femur; this is followed by the third part, which is diſtinguiſhed by the name of *tarſus*, or foot; it is compoſed of ſeveral joints, the one articulated to the other, the number of rings varying in different inſects; the tarſus is terminated by the *unguis*, or claw.

Entomologiſts, in order to render their deſcriptions clear and accurate, have given ſeveral names to the legs of inſects, from the nature of the motions produced by them. Thus *curſorii*, from that of running; theſe are the moſt numerous. The *ſaltatorii*, thoſe that are uſed for leaping; the thighs of theſe are remarkably large, by which means they poſſeſs conſiderable ſtrength and power to leap to great diſtances; as the graſshopper. The *natatorii*, thoſe that ſerve as oars for ſwimming; the feet of theſe are flat, and edged with hairs, poſſeſſing a proper ſurface to ſtrike againſt the water, as in the dytiſcus, notonecta, &c. Such feet as have no claws are termed *mutici*. The *chelæ*, or claws, are an enlargement of the extremity of the fore feet, each of which is furniſhed with two leſſer claws, which act like a thumb and finger, as in the crab; and are called *chelate*. The under part of the feet in ſome inſects is covered with a kind of bruſh or ſponge, by which they are enabled to walk with eaſe, on the moſt poliſhed ſubſtances, ſuch as panes of glaſs, in every direction.

Many inſects can only move the thigh in a vertical direction, while others can move it in a variety of ways. The progreſſive motion of inſects, and the various methods employed to effect it, will be found a very curious and important ſubject, and well worthy the attention of the naturaliſt. The intelligent mechanic may not find it loſt labour if he beſtow ſome time on the ſame ſubject. Very little has been done on this head, and that principally by Reaumur, in his excellent Memoires; and by M. Weiſs, in a Memoir publiſhed in the Journal de Phyſique for 1771. The reader may alſo conſult Borelli de Motu Animalium.

Cauda, the tail, terminates the abdomen, and is conſtructed in a wonderful manner for anſwering the purpoſes for which it is formed, namely, to direct the motion of the inſect, to ſerve as an inſtrument of defence, or for depoſiting its eggs; the figure and ſize thereof varying in each genus and its ſpecies, and moſtly different in the male and female, and thus ſerving to diſtinguiſh the ſexes. In moſt inſects it is ſimple, and yet capable of being extended or drawn back at pleaſure; in others elongated, as in the crab and ſcorpion; or ſhaped like a briſtle, as in the raphidia; or with three appendages like briſtles, as in the ephemera; in ſome it is forked, as in the podura; and in others it is furniſhed with a pair of forceps, as in the earwig; in the blatta, grylli, and others, it is folioſe, or like a leaf; in the ſcorpion and panorpa it is furniſhed with a dart or ſting.

Aculeus, the ſting, is an inſtrument with which inſects wound and inſtil a poiſon; the ſting generally proceeds from the under part of the laſt ring of the helly; in ſome it is ſharp and pointed, in others ſerrated, or formed like a

ſaw.

saw. It is used by many insects both as an offensive and defensive weapon; by others it is only used to pierce the substances where they mean to deposit their eggs. This instrument cannot be properly seen or known, but with the assistance of a microscope. Of bees, it is only the neuters and the queen that have stings. The apparatus is of a very curious construction, fitted for inflicting a wound, and at the same time conveying poison into that wound.—See a figure and description of it, under APIS, vol. i. p. 796.

It has already been observed, that the bodies of insects are covered with a hard skin, answering the purpose of an internal skeleton, and forming one of the characters by which they are distinguished from other animals. This external covering is very strong in those insects which, from their manner of life, are particularly liable to great friction, or violent compression; but is more tender and delicate in such as are not so exposed. Another distinguishing criterion of insects is the colour of their circulating fluid or blood, which is never red; this, at first sight, seems liable to some objections, on account of the drop of red liquor which is often procured from small insects when squeezed to pieces. It does not appear, however, that this is the blood of the animal; when it existed as a worm there was no such appearance, and when transformed to the perfect, or fly state, it is only found in the eye, and not in the body, which would be the case if it circulated in the veins of the insect. It is probable there is a circulation of some fluid analogous to the blood in most insects: with the assistance of the microscope this circulation may be perceived in many; but the circulating liquor is not red.

The student in entomology, who wishes to attain a proper knowledge of the science, will find it necessary to make himself conversant with the various classes, genera, &c. into which insects have been divided by Linnæus. Every system has its defects, and probably some may be found in that of this truly celebrated naturalist; but the purpose of science is answered by using those discriminations which are generally adopted. We shall therefore state the Linnæan classification, illustrated with the Seven Orders of Insects, in the annexed engraving.

ORDERS AND GENERA.

I. COLEOPTERA, [from κωλεος, a sheath, and πτερον, a wing.] Contains all such insects as have crustaceous elytry or shells, called wing-cases, which shut together, and form a longitudinal suture down the back of the insect. These are divided into the following genera:

Antennæ clavate, thicker towards the tip.—Club lamellate.

Scarabæus. - Fore-shanks toothed.
Lucanus. - Two palpigerous tufts under the lip.
Synodendron. Jaw one-toothed; lip filiform, palpigerous.

Club perfoliate.

Dermestes. - Head inflected under the thorax, which is slightly margined.
Melyris. - - Lip clavate, emarginate.
Byrrhus. - Lip extended, bifid.
Silpha. - - Thorax and shells margined.
Tritoma. - Anterior feelers hatchet-shaped.
Hydrophilus. Feelers filiform: jaw bifid, horny.
Tetratoma. - Feelers unequal: jaw bifid, membranaceous.

Club solid or inflated.

Hister. - - Head retractile within the thorax.
Bostrichus. - Head inflected under the thorax, which is slightly margined.
Anthrenus. - Jaw bifid.
Nitidula. - Thorax and shells margined.
Coccinella. - Anterior feelers hatchet-shaped.
Curculio. - Snout elongated, horny.
Pausus. - - Antennæ two-jointed, the club hooked and inflated.

Antennæ moniliform.

Brentus. - - Snout elongated, horny, straight.
Attelabus. - Snout elongated, incurved.
Erodius. - - Lip horny, emarginate.
Staphylinus. - Shells half the length of the body, covering the wings: above the tail two exsertile vesicles.
Zygia. - - - Lip elongated, membranaceous.
Meloe. - - - Thorax rounded: head gibbous, inflected.
Tenebrio. - - Thorax margined: head exserted: body oblong.
Cassida. - - - Body ovate: shells margined: head covered with a shield.
Opatrum. - - Thorax and shield margined.
Mordella. - - Laminæ at the base of the abdomen: head inflected.
Chrysomela. - Body ovate, immarginate.
Horia. - - - Feelers unequal: jaw bifid: lip rounded.

Antennæ filiform.

Apalus. - - Thorax roundish: head gibbous, inflected.
Manticora. - - Jaws exserted, toothed: eyes rather prominent.
Pimelia. - - Thorax margined: head exserted: body oblong.
Gyrinus. - - Antennæ a little rigid: eyes four.
Cucujus. - - Lip short, bifid, the divisions distant.
Cryptocephalus. Body ovate, immarginate.
Bruchus. - - Antennæ growing larger towards the tip.
Ptinus. - - - Thorax receiving the head: last joints of the antennæ longer.
Hispa. - - - Antennæ stretched forward, approximate, fusiform.
Buprestis. - - Head partly retracted within the thorax.
Necydalis. - - Shells half as long as the body: wings naked.
Lampyris. - Shells flexile: thorax surrounding and concealing the head.
Cantharis. - - Shells flexile: sides of the abdomen edged with folded papillæ.
Notoxus. - - Lip bifid: the divisions connivent, obtuse.
Elater. - - - A pectoral spine springing from an abdominal pore.
Calopus. - - Thorax spinous or gibbous at the sides.
Alurnus. - - Jaw arched: feelers six.
Carabus. - - Thorax obcordate, truncate behind.
Lytta. - - - Thorax roundish: head gibbous, inflected.

Antennæ setaceous.

Serropalpus. - Anterior feelers deeply serrate.
Cerambyx. - - Thorax spinous or gibbous at the sides.
Leptura. - - Shells tapering towards the tip: thorax roundish.
Rhinomacer. - Antennæ seated on the snout.
Zonitis. - - - Lip emarginate.
Cicindela. - Jaws exserted, toothed: eyes a little prominent.
Dytiscus. - - Hind legs fringed, formed for swimming.
Forficula. - - Shells half as long as the body: wings covered: tail forked.

II. HEMIPTERA, [from ημισυς, half, and πτερον, a wing.] These have their upper wings usually half crustaceous and half membranaceous, not divided by a longitudinal suture, but incumbent on each other. This order contains the following genera:

Blatta. - - - Mouth armed with jaws: wings coriaceous, plane: legs formed for running.
Pneumora. - - Mouth armed with jaws: wings membranaceous, deflected: legs formed for running.

Mantis.

Mantis. - - Mouth armed with jaws: fore-feet ferrate, the claw ſingle.
Gryllus. - - Mouth armed with jaws: hind-legs formed for leaping.
Fulgora. - - Snout inflected: front projecting, inflated: antennæ capitate.
Cicada. - - - Snout inflected: hind-legs formed for leaping.
Notonecta. - - Snout inflected: hind-legs ciliate within.
Nepa. - - - Snout inflected: fore-legs cheliform.
Cimex. - - Snout inflected: legs formed for running: antennæ longer than the thorax.
Macrocephalus. Snout inflected: antennæ very ſhort.
Aphis. - - - Snout inflected: abdomen two-horned.
Chermes. - - Snout placed in the breaſt: hind-legs formed for leaping.
Coccus. - - Snout placed in the breaſt: abdomen (in the males) terminating in briſtles.
Thrips. - - Snout obſolete: wings incumbent on the abdomen, which is reflexile.

III. LEPIDOPTERA, [from λεπις, a ſcale, and πτερον, a wing,] are inſects having four wings, covered with fine imbricate ſcales reſembling powder or meal; as in the butterfly, moth, &c. This order contains three genera, viz.
Papilio. - - Antennæ thicker towards the tip.
Sphinx. - - Antennæ thicker in the middle.
Phalæna. - - Antennæ thicker towards the baſe.

IV. NEUROPTERA, [from νευρον, a nerve, and πτερον, a wing.] Theſe have four membranous tranſparent naked wings, generally reticulate, or like net-work. This order contains the following genera:
Libellula. - - Tail forked: mouth with many jaws: wings expanded.
Ephemera. - - Tail with two or three briſtles: mouth without teeth: wings erect.
Myrmeleon. - Tail forked: mouth two-toothed: wings deflected.
Phryganea. - Tail ſimple: mouth without teeth: wings deflected.
Hemerobius. - Tail ſimple: mouth two-toothed: wings deflected.
Panorpa. - - Tail chelate: mouth with an extended ſnout: wings incumbent.
Raphidia. - - Tail ending in a ſingle thread: mouth two-toothed: wings deflected.

V. HYMENOPTERA, [from υμεν, a membrane, and πτερον, a wing,] comprehend inſects with four membranous wings, and a tail. This order contains the following genera:
Cynips. - - - Sting ſpiral.
Tenthredo. - Sting ſerrate, two-valved.
Sirex. - - - Sting ſerrate, projecting from a ſpine under the abdomen.
Ichneumon. - Sting exferted, triple.
Sphex. - - - Sting pungent: wings ſmooth: tongue flat, dilated, nearly entire at the end.
Ammophila. - Sting pungent: wings ſmooth: tongue inflected, bifid.
Scolia. - - - Tongue inflected, trifid: lip membranaceous at the end.
Thynnus. - - Tongue very ſhort, involute: lip trifid.
Leucopſis. - Lip longer than the jaw, notched: antennæ clavate.
Tiphia. - - Lip ſhort, horny, three-toothed.
Chalcis. - - Antennæ ſhort, cylindrical, fuſiform.
Chryſis. - - Sting pungent: abdomen arched beneath.
Veſpa. - - - Sting pungent: upper wings folded.
Apis. - - - Sting pungent: tongue inflected.
Formica. - - Sting obſolete: neuters without wings.
Mutilla. - - Sting pungent: neuters without wings.

VI. DIPTERA, [from δυω, two, and πτερον, a wing,] comprehend all ſuch inſects as have only two wings, and poiſers or balancers. This order contains the following genera:

With proboſcis and ſucker.

Diopſis. - - Head two-horned: eyes terminal.
Tipula. - - Sucker without a ſheath: feelers two, projecting, filiform.
Muſca. - - Sucker without a ſheath, furniſhed with briſtles.
Tabanus. - - Sucker with a ſingle-valved ſheath, furniſhed with briſtles.
Empis. - - Proboſcis inflected.
Conops. - - - Proboſcis projecting, geniculate.

With ſucker, but no proboſcis.

Oeſtrus. - - Sucker retracted within the perforated lips.
Aſilus. - - - Sucker ſtraight, two-valved, gibbous at the baſe.
Stomoxys. - Sucker with a ſingle-valved convolute ſheath, geniculate at the baſe.
Culex. - - Sheath exſerted, one-valved, flexile, with five briſtles.
Bombylus. - Sucker very long, ſtraight, ſetaceous, two-valved.
Hippoboſca. - Sucker ſhort, cylindrical, ſtraight, two-valved.

VII. APTERA, [from α, without, and πτερον, a wing,] inſects having no wings. This order contains the following genera:

Legs ſix: head diſtinct from the thorax.

Lepiſma. - - Tail ending in ſetaceous briſtles.
Podura. - - Tail forked, inflected, elaſtic.
Termes. - - Mouth with two jaws: lip horny, four-cleft.
Pediculus. - Mouth armed with an exſertile ſting.
Pulex. - - Snout inflected, armed with a ſting: feet formed for leaping.

Legs eight to fourteen: head and thorax united.

Acarus. - - Eyes two: legs eight: feelers compreſſed.
Hydrachna. - Eyes two to eight: legs eight: abdomen with textorial papillæ.
Aranea. - - Eyes eight: legs eight: abdomen with textorial papillæ: feelers clubbed.
Phalangium. - Eyes four: legs eight: feelers chelate.
Scorpio. - - Eyes eight: legs eight: feelers chelate.
Cancer. - - Eyes two: legs ten: the firſt pair chelate.
Monoculus. - Eyes two: legs twelve: ten of them chelate.
Oniſcus. - - Eyes two: legs fourteen.

Legs numerous: head diſtinct from the thorax.

Scolopendra. - Body linear.
Julus. - - - Body ſubcylindrical.

The annexed engraving, Entomology Plate I. is calculated to exhibit at one view the conſtruction of the ſeven orders of the INSECTA of Linnæus. Fig 1, a COLEOPTEROUS inſect; the Bupreſtis gigantea. Fig. 2, the female of the ſame. Fig. 3, an HEMIPTEROUS inſect; the Blatta Americana. Fig. 4, the female of the ſame. Under the female at *a*, is ſhewn the egg of the blatta, with a young larva, *b*, juſt quickened, and emerging from it. Fig. 5, a LEPIDOPTEROUS inſect; the Phalæna coſſus, or goat moth. Fig. 6, another LEPIDOPTEROUS inſect; the Papilio vanillæ, or butterfly with ſpiral proboſcis. Fig. 7, a bunch of eggs belonging to the goat-moth. Fig. 8, an unimpregnated egg, magnified; and Fig. 9, two fecundated eggs, alſo magnified, belonging to the butterfly. Fig. 10, a NEUROPTEROUS inſect; the Libellula Carolina, or male dragon-fly of Carolina: Fig. 11, the female of the ſame. Fig. 12, an HYMENOPTEROUS inſect; the Apis muſcorum, or moſſy humming bee.

Fig. 13, the female. Fig. 14, a DIPTEROUS inſect; the Oeſtrus equi. Fig. 15, its female: this produces the *bots* in horſes. Fig. 16, an APTEROUS inſect; the female of the Fermes fatale, or white ant. Fig. 17, the male of the ſame, which being winged, may, while in this ſtate, be conſidered as a Neuropterous inſect. See the *larvæ* and *chryſalides* of theſe ſeven orders of inſects, in the Entomology Plate II.

OF THE TRANSFORMATION OF INSECTS.

Inſects are diſtinguiſhed from other animals by the wonderful changes that all thoſe of the winged ſpecies without exception, and ſome which are deſtitute of wings, neceſſarily paſs through, before they can arrive at the perfection of their nature. Moſt animals retain, during their whole life, the ſame form which they receive at their birth; but inſects go through various exterior and interior changes, inſomuch that the ſame individual, at its birth and middle ſtate, differs eſſentially from that under which it appears when arrived at a ſtate of maturity; and this difference is not confined to marks, colour, or texture, but is extended to their form, proportion, motion, organs, and habits of life. It was not till towards the latter end of the ſeventeenth century, that any juſt conception of this ſubject was formed. By diſſection juſt before their changes, it was readily ſeen that the moth and butterfly grow and ſtrengthen themſelves, that their members are formed and unfolded under the figure of the inſect we call a caterpillar, and that the growth is effected by a developement of parts; conſequently the changes which are apparently ſudden to our eyes, are gradually formed under the ſkin of the animal, and only appear ſudden to us, becauſe the inſect then gets rid of a caſe which had before concealed its members. By this caſe it is preſerved from injuries, till its wings, and every other part of its delicate frame, are in a condition to bear the impulſe of the ſun, and the action of the air; and when all the parts are grown firm, and ready to perform their ſeveral offices, the perfect animal appears in the form of its parents. Theſe transformations clearly prove, that without experience every thing in nature would appear a myſtery; ſo much ſo, that a perſon unacquainted with the tranſformation of the caterpillar to the chryſalis, and of this to the fly, would conſider them as three diſtinct ſpecies of inſects; for who, by the mere light of reaſon unaided by experience, could believe that a butterfly, adorned with four beautiful wings, furniſhed with a long ſpiral proboſcis or tongue, inſtead of a mouth, and with ſix legs, proceeded from a hairy caterpillar, provided with jaws and teeth, and fourteen feet? Without experience, who could imagine that a long white ſoft worm hid under the earth, ſhould be transformed into a cruſtaceous chafer? Nor could any one, from conſidering them in their perfect ſtate, have diſcovered the relation which they bear to the correſponding forms through which they have paſſed, and which are to appearance as diſtinct as difference can make them.

The life of thoſe inſects which paſs through theſe various changes, may be divided into four principal ſtates. The firſt change is from the *egg* into the *larva*; or, as it is more generally called, into the worm or caterpillar. From the *larva* it paſſes into the *pupa*, or chryſalis ſtate. From the *pupa*, into the *imago*, or fly ſtate.

Few ſubjects are more expreſſive of the extenſive goodneſs of Divine Providence, than theſe transformations, in which we find the temporary parts and organs of theſe little animals ſuited and adapted with the moſt minute exactneſs to the manner of their exiſtence; which again are ſhifted and changed, upon the inſects commencing a new ſcene and ſtate of action. In its larva ſtate the inſect appears groveling, heavy, and voracious, in the form of a worm, with a long body compoſed of ſucceſſive rings; crawling along by the aſſiſtance of theſe, or ſmall little hooks, which are placed on the ſide of the body. Its head is armed with ſtrong jaws, its eyes ſmooth, entirely deprived of ſex, the blood circulating from the hind part towards the head. It breathes through ſmall apertures, which are ſituated on each ſide of the body, or through one or more tubes placed in the hinder part thereof. While it is in the larva ſtate, the inſect is as it were maſked, and its true appearance concealed; for under this maſk the more perfect form is hidden from the human eye. In the pupa, or chryſalis ſtate, the inſect may be compared to a child in ſwaddling clothes; its members are all folded together under the breaſt, and incloſed within one or more coverings, remaining there without motion. While in this ſtate, no inſects but thoſe of the hemiptera claſs take any nouriſhment. The change is effected various ways; in ſome inſects the ſkin of the larva opens, and leaves a paſſage, with all its integuments; in others, the ſkin hardens and becomes a ſpecies of cone, which entirely conceals the inſect; others form or ſpin cones for themſelves, and in this ſtate they remain till the parts have acquired ſufficient firmneſs, and are ready to perform their ſeveral offices. The inſect then caſts off the ſpoils of its former ſtate, wakes from a death-like inactivity, breaks the incloſures of its tomb, throws off the duſky ſhroud, and appears in its imago or perfect form; for it has now attained the ſtate of organical perfection, which anſwers to the rank it is to hold in the corporeal world: the ſtructure of the body, the alimentary organs, and thoſe of motion, are materially changed. It is now furniſhed with organs of generation, and with wings magnificently adorned; it ſoars above its former purſuits, plays in the genial air, chooſes its mate, and tranſmits its nature to a ſucceeding race. Thoſe members, which in the preceding ſtate were wrapped up, ſoft, and motionleſs, now diſplay themſelves, grow ſtrong, and are put in exerciſe. The interior changes are as conſiderable as thoſe of the exterior form, and that in proportion as the firſt ſtate differs from the laſt; ſome organs acquire greater ſtrength and firmneſs, others are rendered more delicate; ſome are ſuppreſſed, and ſome unfolded which did not appear to exiſt in the former ſtages of its life.

The greater part of thoſe inſects which come forth in ſpring or ſummer, periſh at the approach of winter; there are very few, the period of whoſe life exceeds that of a year; thoſe which ſurvive the rigours of winter, are buried under ground; many are hid in the bark of trees, and others in the chinks of old walls; ſome, like the caterpillar of the brown-tailed moth, at the approach of winter ſecure and ſtrengthen the web in which the ſociety inhabit, and thus protect themſelves, till the ſpring animates them to new life. Many that are hatched in the autumn, retire and live under the earth during the winter months, but in the ſpring come out, feed, and proceed onward to their ſeveral changes; while no ſmall part paſs the colder months in their chryſalis or pupa ſtate: but the greater number of the caterpillar race remain in the egg, being carefully depoſited by the parent fly in thoſe places where they will be hatched with the greateſt ſafety; in this ſtate the latent principle of life is preſerved till the genial influences of the ſpring call it into action, and bring forth the young inſect to ſhare the banquet that nature there provides.

All caterpillars are hatched from the egg, and when they firſt proceed from it are generally ſmall and feeble, but grow in ſtrength as they increaſe in ſize. The body is divided into twelve rings; the head is connected with the firſt, and is hard and cruſtaceous. No caterpillar of the moth or butterfly has leſs than eight, or more than ſixteen, feet; the ſix firſt are cruſtaceous, pointed, and fixed to the three firſt rings of the body; theſe feet are the covering to the ſix future feet of the moth; the other ſix feet are ſoft and flexible or membranaceous; they vary both in figure and number, and are proper only to the larva ſtate; with reſpect to their external figure, they

are

The seven Orders of Insects.

London Published as the Act directs. Sept.r 22. 1804. by J. Wilkes.

are either ſmooth or hairy, ſoft to the touch, or hard like ſhagreen, beautifully adorned with a great variety of the moſt lively tints; on each ſide of the body nine ſtemmata, or little oval holes, are placed, which are generally conſidered as the organs of reſpiration. There are on each ſide of the head of the caterpillar five or ſix little black ſpots, which are ſuppoſed to be its eyes. Theſe creatures vary in ſize, from half an inch long to four and five inches.

The caterpillar, whoſe life is one continued ſucceſſion of changes, often moults its ſkin before it attains its full growth; not one of them arrives at perfection, without having caſt its ſkin twice or thrice. Theſe changes are the more remarkable, becauſe when the caterpillar moults, it is not ſimply the ſkin that is changed; for we find in the exuvia, the ſkull, the jaws, and all the exterior parts, both ſcaly and membranaceous, which compoſe its upper and under lip, its antennæ, palpi, and even thoſe cruſtaceous pieces within the head, which ſerve as a fixed baſis to a number of muſcles; we further find in the exuvia, the ſpiracula, the claws, and ſheaths of the anterior limbs, and in general all that is viſible of the caterpillar. The new organs appear under the old ones as in a ſheath, ſo that the caterpillar effects the changes by withdrawing itſelf from the old ſkin, when it finds itſelf lodged in too narrow a compaſs. But to produce this change, to puſh off the old covering, and bring forward the new, is a work of labour and time. Thoſe caterpillars who live in ſociety, and have a kind of neſt or habitation, retire there to change their ſkins, fixing the hooks of the feet, during the operation, firmly in the web of their neſt. Some of the ſolitary ſpecies ſpin at this time a ſlender web, to which they affix themſelves. A day or two before the moment approaches, the inſect ceaſes to eat, and loſes its uſual activity; in proportion as the time of change advances, the colour of the caterpillar becomes more opaque; the ſkin hardens and withers, and is ſoon incapable of receiving thoſe juices by which it was heretofore nouriſhed and ſupported. The inſect may now be ſeen, at diſtant intervals, to elevate its back, and ſtretch itſelf to its utmoſt extent; ſometimes to lift up the head, move it a little from ſide to ſide, and then let it reſt again. By repeated exertions, all the veſſels which conveyed the nouriſhment to the exterior ſkin are diſengaged, and ceaſe to act, and a ſlit is made on the back, generally beginning at the ſecond or third ring; the new ſkin may now be juſt perceived, being diſtinguiſhed by the freſhneſs and brightneſs of its colour; the caterpillar then preſſes the body like a wedge into this ſlit, by which means it is ſoon opened from the firſt down to the fourth ring; this renders it large enough to afford the inſect a paſſage, which it ſoon effects in a very curious manner. The caterpillar generally faſts a whole day after each moulting, for it is neceſſary that the parts ſhould acquire a certain degree of conſiſtency, before it can act in its uſual manner; many alſo periſh under the operation. The body having grown under the old ſkin, till the inſect was become too large for it, it always appears much larger after it has quitted the exuvia: now as the growth was gradual, and the parts ſoft, the ſkin preſſed them together, ſo that they lay in a ſmall ſpace; but as ſoon as the ſkin is caſt off, they are as it were liberated from their bounds, and diſtend themſelves conſiderably. Some caterpillars, in changing their ſkin, from ſmooth, become covered with fine hair; while others, that were covered with this fine hair, have the laſt ſkin ſmooth. The ſilkworm, previous to its chryſalis or pupa ſtate, caſts its ſkin four times; the firſt is caſt on the tenth, eleventh, or twelfth, day, according to the nature of the ſeaſon; the ſecond, in five or ſix days after; the third in five or ſix days more, and the fourth and laſt in ſix or ſeven days after the third.

Entomologiſts diſtinguiſh the different appearances of the inſect in its pupa ſtate, as follows: It is called *coarctata*, when it is confined to a caſe of a globular form, without the ſmalleſt reſemblance to the ſtructure of the inſect it contains, as in the diptera. It is called *obtecta*, when the inſect is inveloped in a cruſtaceous covering, conſiſting of two parts, one of which ſurrounds the head and thorax, the other the abdomen. It is termed *incomplete*, when the pupa has perceptible wings and feet, but cannot move them, as in moſt of the hymenoptera. *Semicomplete*, when the pupa can walk or run, having only the rudiments of wings; as in the claſs hemiptera. The difference between the pupa and the larva of this order, is very inconſiderable; as they eat, walk, and act, juſt as they did in their primitive ſtate. *Complete* are thoſe which take their perfect form at their birth, and do not paſs, like other inſects, through a variety of ſtates, though they often change their ſkin; as is the caſe with many of the aptera claſs.

It is a general rule, that all winged inſects neceſſarily paſs through the larva and pupa ſtate, before they aſſume their perfect form: there are alſo inſects which have no wings, and yet undergo ſimilar transformations, as the bed bug, the flea, &c. Other inſects, which have no wings, and which always remain without them, never paſs through the pupa ſtate, but are ſubject to conſiderable changes, as well with reſpect to the number as the figure of their parts; thus mites have four pair of feet, and two ſmaller ones at the fore part of the body, near the head; yet ſome of theſe are born with only three pair of feet, the fourth is not evolved till ſome time after their birth. The figure of the *monoculus quadricornis* changes conſiderably after its birth, The *julus* is an inſect with a great number of feet; and yet theſe at their birth have only three pair, the reſt putting not forth till ſome time after.

When the caterpillar has attained to its full growth, and the parts of the future moth or butterfly are ſufficiently formed beneath its ſkin, it prepares for its change into the pupa ſtate; it ſeeks for a proper place in which to perform the important buſineſs: the different methods employed by theſe little animals to ſecure this ſtate of reſt, may be reduced to four: ſome ſpin follicles or cones, in which they incloſe themſelves; others conceal themſelve in little cells, which they form under ground; ſome ſuſpend themſelves by a glutinous matter at their poſterior extremity; while others are ſuſpended by a girdle that goes round their body. Preparatory to the change, the caterpillar empties itſelf of all the excrementitious matter that is contained in the inteſtines, voiding at the ſame time the membrane which ſerved as a lining to theſe and the ſtomach. The inteſtinal canal is compoſed of two principal tubes, the one inſerted into the other; the external tube is compact and fleſhy, the internal one is thin and tranſparent; it is the inner tube, which lines the ſtomach and inteſtines, that is voided with the excrement before the metamorphoſis. It generally perſeveres in a ſtate of reſt for ſeveral days, which affords the external and internal organs that are under the ſkin an opportunity of gradually unfolding themſelves. In proportion as the change into the pupa form approaches, the body is obſerved often to extend and contract itſelf; the hinder part is that which is firſt diſengaged from the caterpillar ſkin; when this part of the body is free, the animal contracts and draws it up towards the head; it then liberates itſelf in the ſame manner from the two ſucceeding rings, conſequently the inſect is now lodged in the fore part of its caterpillar covering; the half which is abandoned remains flaccid and empty, while the fore part is ſwoln and diſtended. The animal, by ſtrong efforts, ſtill forcing itſelf againſt the fore part of the ſkin, burſts the ſkull into three pieces, and forms a longitudinal opening in the three firſt rings of the body; through this it proceeds, drawing one part after the other, by alternately lengthening and ſhortening, ſwelling and contracting the body and different rings; or elſe, by puſhing back the exuvia, finally gets rid of its reptile form.

The caterpillar, thus ſtripped from its ſkin, now becomes the pupa, nymph, chryſalis, or aurelia, in which the parts of the future moth are incloſed; but are ſo ſoft, that

that the ſlighteſt touch will diſcompoſe them. The exterior part of the chryſalis is at firſt exceedingly tender, ſoft, and partly tranſparent, being covered with a viſcous fluid; this ſoon dries up, thickens, and forms a cruſt round the animal, capable of reſiſting external injuries; a caſe, which is at the ſame time the ſepulchre of the caterpillar, and the cradle of the moth; where, as under a veil, this curious transformation is carried on. The pupa was firſt called a chryſalis, or *creature made of gold*, from the reſplendent yellow colour with which ſome kinds are adorned. Reaumur has ſhewn us whence they derive this rich colour; that it proceeds from two ſkins, the upper one a beautiful brown, which lies upon or covers a highly poliſhed and ſmooth white ſkin; the light reflected from the laſt, in paſſing through, gives it the golden yellow, in the ſame manner as this colour is often given to leather; ſo that the whole appears gilt, although no gold enters into the tincture. The chryſalis of the common white butterfly furniſhes a moſt beautiful object for the lucernal opake microſcope.

Thoſe who are deſirous to diſcover diſtinctly the various members of the moth in the pupa, ſhould examine it before the fore-mentioned fluid is dried up, when it will be found to be only the moth with the members glued together; theſe, by degrees, acquire ſufficient force to break their covering, and diſengage themſelves from the bands which confine them. While in this ſtate, all the parts of the moth may be traced out, though ſo folded and laid together, that it cannot make any uſe of them; nor is it expedient that it ſhould, as they are too ſoft and tender to be uſed, and paſs through this ſtate merely to be hardened and ſtrengthened. To examine the moth concealed under the ſkin of a caterpillar, one of them ſhould be taken at the laſt change; when the ſkin begins to open, it ſhould be drowned in the ſpirit of wine, or brandy, and be left therein for ſome days to harden; the ſkin of the caterpillar may then be eaſily removed: the rudiments of the chryſalis will be firſt diſcovered, after which the tender moth appears; and its wings, legs, antennæ, &c. may be opened and diſplayed by an accurate obſerver.

The time which the moth or butterfly remains in the pupa ſtate is not always the ſame, varying in different ſpecies, and depending alſo upon the warmth of the weather, and other adventitious circumſtances; ſome remain in that ſituation for a few weeks; others do not attain their perfect form for eight, nine, or eleven, months: this often depends on the ſeaſon in which they aſſume the pupa form, or rather on the time of their birth. Some irregularities are alſo occaſioned by the different temperature of the air, by which they are retarded or accelerated, ſo as to be brought forward in the ſeaſon beſt ſuited to their nature and the ends of their exiſtence.

When the moth or butterfly is ſufficiently matured to break the bonds which ſurround it, and of which it ſeems to be informed by its internal ſenſations, it makes a powerful effort to eſcape from its priſon, and view the world with new-formed eyes. A ſmall degree of motion, or a little inflation of the body, is ſufficient to enlarge the hole, and afford the animal room to eſcape from its confinement. When the moth firſt ſees the day, it is humid and moiſt; but this humidity ſoon evaporates, the interior parts dry and harden as well as the exterior; the wings, which are wrinkled, being thick and ſmall, then extend themſelves, and the fibres which were at firſt flexible, become hard and ſtiff. The wings, though at firſt ſcarcely half the length of the body, ſoon acquire their full ſize: nor is it the wings only which are thus rapidly increaſed; all their ſpots and colours are proportionably extended, ſo that what at firſt appeared as ſo many confuſed points, become diſtinct and beautiful ornaments; and thoſe that are furniſhed with a tongue or trunk, curl and coil it up. When the wings are unfolded, the tongue rolled up, the parts ſufficiently dried, and the different members ſtrengthened, it takes its flight. Moſt of them, ſoon after they have attained their perfect ſtate, void an excrementitious ſubſtance; and Reaumur thinks that they eject very little, if any, during the reſt of their lives. If the moth be now opened down the belly, the groſs artery, which is called the heart, will be viſible, and the contractions and dilatations, by which it puſhes forward the liquor it contains, may be eaſily obſerved. One of the moſt remarkable circumſtances is, that the circulation of this fluid in the winged ſtate is directly contrary to that which took place in the caterpillar; in this, the liquor moved from the tail to the head, whereas in the winged ſtate, it moves from the head to the tail; ſo that the fluid which anſwers the purpoſes of blood, goes from the ſuperior towards the inferior parts; but in the caterpillar the order is reverſed: it proceeds from the inferior towards the ſuperior parts.

The induſtry of thoſe moths that ſpin cones or follicles in which they incloſe themſelves for their transformation, is well known and admired; ſince it is from a ſpecies of theſe, the *phalæna mori*, or ſilk-worm, that we derive ſo many benefits to the community. All caterpillars undergo ſimilar changes with it, and many of the genus greatly exceed it in beauty: but the golden tiſſue in which the ſilk-worm wraps itſelf, far ſurpaſſes the ſilky threads of all the other ſpecies: they may indeed come forth with a variety of colours, and wings bedecked with gold and ſcarlet; yet they are but the beings of a ſummer's day; both their life and beauty quickly vaniſh, and leave no remembrance of them; but the ſilk-worm leaves behind it ſuch beneficial monuments, as at once record the wiſdom of its Creator, and his bounty to man. The ſubſtance of which the ſilk is formed, is a fine yellow tranſparent gum, contained in two reſervoirs that wind about the inteſtines, and which, when they are unfolded, are about ten inches long; they terminate in two exceeding ſmall orifices near the mouth, through which the ſilk is drawn, or ſpun to the degree of fineneſs which its occaſions may require.

When the ſilk-worm, or caterpillar of the phalæna mori, is about to enter its pupa ſtate, it ſets to work, firſt ſpinning ſome random threads, which ſerve to ſupport the future ſuperſtructure; upon theſe it forms an oval of a looſe texture, conſiſting of what is called the floſs-ſilk; within this it forms a more conſiſtent ball of ſilk, remaining during the whole buſineſs within the circumference of the ſpheroid that it is forming, reſting on its hinder parts, and with its mouth and fore legs directing and ſecuring the threads. Theſe threads, when meaſured, have been found to be about three hundred yards long, and ſo fine, that eight or ten are generally rolled off into one by the manufacturers. The ſilk-worm uſually employs about three days in finiſhing this cone; the inſide is generally ſmeared with a kind of gum, that is deſigned to keep out the rain: within this cone it aſſumes the pupa form, and remains therein from fifteen to thirty days, according to the warmth of the climate. When the moth is ſufficiently matured, it moiſtens the end of this cone, and by frequent motions of the head looſens the texture of the ſilk, ſo as to form a hole without breaking it, and through which it eſcapes. For more on the natural hiſtory of the moth, and the manufacture of ſilk, ſee the articles PHALÆNA, and SILK.

The coleoptera genus, or beetle, is an inſect alſo diſengaged from the pupa form, before it can attain its winged ſtate. The pupa is a transformation in like manner from the worm or larva, and this derived its exiſtence from the egg; ſo that here, as in the foregoing inſtances, one inſect is exhibited in four different forms, before it acquires its perfect organization, or mature ſtate of life. The worm or grub of the beetle, like other inſects in the larva ſtate, in order to undergo its transformation, diſcharges all its excrement, and forms a convenient hole in the earth; where it caſts not off merely the external covering, but the throat, a part of the ſtomach, and the inward ſurface of the great canal, change at the ſame time their ſkin. After the transformation, the head and teeth

are white and tender, though before as hard as bone; ſo that the larva, when provoked, will attempt to gnaw iron. When the worm aſſumes the pupa ſtate, it forms with the hinder feet a poliſhed cavity, in this it lies for ſome time immoveable; after which, by voiding excrementitious ſubſtances, and by the evaporation of humidity, it becomes thinner and ſhorter, the ſkin more furrowed and wrinkled, ſo that it ſoon appears as if it were ſtarved by degrees. If it be diſſected about this period, the head, the belly, and the thorax, may be clearly diſtinguiſhed. While ſome external and internal parts are changing by a ſlow accretion, others are gently diſtended by the force of the impelled humours. The body contracting itſelf, while the circulating fluid is propelled towards the head, forces the ſkull open in three parts, and the ſkin in the middle of the back is ſeparated by means of an undulating motion of the inciſions of the back; at the ſame time the eyes, the horns, the lips, &c. caſt their exuvia. During this operation, a thin watery humour is diffuſed between the old and new ſkin, which renders the ſeparation eaſier. The proceſs going on gradually, the larva is at laſt diſengaged from its ſkin, and the limbs and parts are, by a continual unfolding, transformed into the pupa ſtate; after which, it twiſts and compreſſes the exuvia by the fundament, and throws it towards the hinder part under the belly. The pupa is at this time very delicate, tender, and flexible; and affords a moſt pleaſing appearance to an attentive obſerver. In it the future parts of the beetle are finely exhibited, ſo diſpoſed and formed, as ſoon to be able to ſerve the creature in a more perfect ſtate of life, and to put on a more elegant form.

The pupa of this inſect weighs, a little after its change, much heavier than it does in its beetle ſtate; this is alſo the caſe with the pupa of the bee and hornet. The latter has been found to weigh ten times as much as the hornet itſelf; this is probably occaſioned by a ſuperabundant moiſture, by which theſe inſects are maintained and nouriſhed during their torpid ſtate. How long the ſcene of mutation continues is not known; ſome remain during the whole winter, more particularly thoſe which quit the larva ſtate in autumn, when a ſudden cold checks their further operations, and conſequently they remain a pupa for ſeveral months. Some ſpecies of the beetle tribe go through all the ſtages of their exiſtence in a ſeaſon, while others employ near four years in the proceſs, and live as winged inſects a year.

When the proper time for the final change arrives, all the muſcular parts grow ſtrong, and are thus more able to ſhake off their laſt integuments, which is performed exactly in the ſame manner as in the paſſage of the inſect from the larva to the pupa ſtate; ſo that in this laſt ſkin, which is extremely delicate, the traces of the pulmonary tubes, that have been pulled off and turned out, again become viſible. All parts of the inſect, and more particularly the wings and their caſes, are at this period ſwelled and extended by the air and fluids which are driven into them through the arteries and pulmonary tubes; the wings are now ſoft as wet paper, and the circulating fluid iſſues from them on the leaſt wound; but when they have acquired their proper conſiſtency, which in the elytra is very conſiderable, they do not exhibit the leaſt ſign of any fluid within them, though cut or torn almoſt aſunder.—The pupa being diſengaged from its ſkin, aſſumes the form of a beetle, and acquires a diſtinction of ſex, being either male or female. The inſect now enters on its laſt ſtate of exiſtence; raiſes itſelf towards the ſkies, plays in the ſunbeam, propagates its like, depoſits the eggs for a new progeny in a ſecure place, and dies.

Such is the proceſs of the transformation of thoſe inſects whoſe habitudes confine them to dry land. We ſhall now deſcribe the metamorphoſis of an aquatic inſect, the *muſca chamæleon*. In the worm or larva condition it lives in the water, breathes by the tail, and carries its legs within a little trunk near its mouth. When the time arrives for its pupa ſtate, it goes through the change without caſting off the ſkin of the larva. But in the imago, or fly ſtate, it would infallibly periſh in the water, was not the larva by nature inſtructed how to chooſe a ſuitable ſituation for its approaching transformation. The larva of this inſect appears to conſiſt of twelve annular diviſions; by theſe it is ſeparated into a head, thorax, and abdomen; but as the ſtomach and inteſtines lie equally in the thorax and abdomen, it is not eaſy to diſtinguiſh their limits until the inſect approaches the pupa ſtate. The parts moſt worthy of notice, are the tail, and the ſnout or trunk.—The tail is furniſhed with an elegant circle of briſtles, diſpoſed quite round it in annular form; by means of this the tail is ſupported on the ſurface of the water, while the worm or larva is moving therein, the body in the meanwhile hanging towards the bottom in ſearch of food. When it is diſpoſed to ſink to the bottom, it turns the briſtles of the tail towards each other, hollow in the middle, but cloſe towards the extremity; by theſe means a conical ſpace is formed, and the bladder of air pent up in it looks like a pearl. It is by the aſſiſtance of this little balloon, that the inſect raiſes itſelf again to the ſurface. If this bubble eſcape, it can replace it from the pulmonary tubes; ſometimes large quantities of air may be ſeen to ariſe in bubbles from the tail of the worm to the ſurface of the water, and there mix with the incumbent atmoſphere. This operation may be eaſily ſeen by placing the worm in a tumbler of water, where it will afford a very entertaining ſpectacle. The ſnout or trunk is divided into three parts, of which that in the middle is immoveable; the two other parts grow from the ſides of the former; theſe are moveable, vibrating in a very ſingular manner, like the tongues of lizards and ſerpents. The greateſt ſtrength of the animal reſides in theſe lateral parts of the ſnout; it is on theſe that it walks at the bottom of the water, and alſo on dry land; appearing, as it were, to walk on its mouth, and uſing it as a parrot does its beak, to climb with greater advantage.

Theſe larvæ are generally to be found in ſhallow ſtanding waters, about the beginning of June, ſooner or later, as the ſummer is more or leſs favourable. After a certain period they paſs into the pupa form. When they are about to change, they betake themſelves to the herbs that float on the ſurface of the water, and creep gently thereon, till at length they lie partly on the dry ſurface, and partly on the water; when in the larva or pupa ſtate, they can live in water, but can by no means inhabit there when changed into flies. When theſe worms have found a proper ſituation, they by degrees contract themſelves, and loſe all power of motion. The inward parts of the worm's tail now ſeparate from the outer ſkin, and become greatly contracted; by this contraction, an empty ſpace is left, into which the air ſoon penetrates. Thus this inſect paſſes into the pupa ſtate under its own ſkin, entirely different from that of the caterpillar. This change may often be obſerved to take place in the ſpace of ten or twelve hours; but in what manner it is performed, or how effected, is hidden from our view.

Whilſt the larva is thus changing under the ſkin, the body, the head, and tail, ſeparate inſenſibly from their outward veſture. The legs at this time, and their cartilaginous bones, are, on account of the parts which are withdrawn from them, left empty; the worm loſes alſo the former ſkull, together with the bones belonging thereto, which remain in the ſkin of the exuvia. It is worthy of notice, that the optic nerves ſeparate alſo from the eyes, and no more perform their office. The muſcles of the rings in like manner, and a great part of the pulmonary points of reſpiration, are ſeparated from the external cuticle. Thus the whole body contracts itſelf by degrees into a compact maſs. At this time the gullet and pulmonary tubes caſt a coat within the ſkin. To make this evident, it is neceſſary to open the abdomen; when the pupa, its parts, together with the caſt-off pulmonary pipes, may be clearly diſtinguiſhed.

When the time approaches that the hidden inſect is to attain

attain the imago, or fly ſtate, which generally happens in about eleven days after the preceding change, the ſuperfluous humours are evaporated, and the pupa is contracted into the fifth ring of the ſkin, and the four laſt rings of the abdomen are filled with air, through the aperture in the reſpiratory orifice of the tail. This may be ſeen by expoſing the pupa for a ſhort ſpace to the rays of the ſun, and then putting its tail in water, when it will breathe ſtronger than it did before, and, by expreſſing an air bubble out of its tail, and then ſucking it in again, will manifeſtly perform the action of inſpiration and expiration. If the exterior caſe be opened near this period, a wonderful variety of colours may be perceived through the ſkin which inveſts the pupa. The colonrs of many of the different parts are now changed; ſome parts from aqueous become membranaceous, ſome fleſhy, and others cruſtaceous. When the fly begins to appear, the exterior ſkin is ſeen to move about the third and fourth anterior ring; the inſect then uſes all its efforts to quit the interior and exterior ſkin at one and the ſame time. The exterior ſkin is divided into four parts; the inſect immediately afterwards breaks open its inner coat, and caſting it off, eſcapes from its priſon in the form of a beautiful fly. Having thus acquired its perfect ſtate, the little animal which lived before in water and mud, enters into a new ſcene of life, viſits the fields and meadows, is tranſported through the air on its elegant wings, and ſports in the wide expanſe with unreſtrained freedom. For a view of this inſect in the worm ſtate, ſee the Entomology Plate II. fig. 14. and for its imago or fly ſtate, ſee the engraving to the article MUSCA.

Another very curious aquatic inſect is the *libellula*, or dragon fly. This inſect partakes of almoſt all colours, green, blue, crimſon, ſcarlet, and white; ſome unite a variety of the moſt vivid tints, and exhibit in one animal more different ſhades than are to be found in the rainbow. But it is not to colour alone that their beauty is confined, it is heightened by the brilliancy of their eyes, and the delicate texture and wide expanſion of their wings. The larva of the libellula is an inhabitant of the water, the fly itſelf is generally found hovering on its banks. The dragon fly is exhibited in the Entomology Plate I. fig. 10, 11; and the larva and pupa in Plate II. fig. 15, 16. But for figures of the moſt curious and elegant ſpecies of the fly, ſee the engraving to the article LIBELLULA.

Theſe inſects are produced from an egg, which is depoſited in the water by the parent; the egg ſinks to the bottom, and remains there till the worm finds ſtrength to break the ſhell. The larva is hexapode, and not ſo long as the fly; on the trunk are four prominences or little bunches, which become more apparent as the larva increaſes in ſize, and changes its ſkin. Theſe bunches contain the rudiments of the wings, which adorn the inſect when in its perfect ſtate. The head of the larva is exceedingly ſingular, the whole fore part of it being covered with a maſk, having proper cavities to ſuit the different prominences of the face; it is of a triangular form, growing ſmaller towards the bottom; at this part there is a knuckle that fits a cavity near the neck, on which it turns as on a pivot. The upper part of this maſk is divided into two pieces or ſhutters, which the inſect can open or cloſe at pleaſure; it can alſo let down the whole maſk whenever it pleaſes. The edges of the ſhutters are jagged like a ſaw. It makes uſe of the maſk to ſeize and hold its prey. Theſe larva generally live and feed at the bottom of the water, ſwimming only occaſionally: their manner of moving in the water is curious, being by ſudden jerks; but this motion is not occaſioned by their legs, which at this time are kept cloſe to the body; it is by forcing out a ſtream of water from the tail, that the body is carried forward; this may be eaſily perceived, by placing them in a flat veſſel, in which there is only juſt water enough to cover the bottom. Here the action of the water ſquirted from the tail will be very viſible; it will occaſion a ſmall current, and give a ſenſible motion to any light bodies on the ſurface. This action can only be effected at intervals, becauſe after each expulſion the inſect is obliged to inhale a freſh ſupply of water. The larva will ſometimes turn its tail above the ſurface of the water, and eject a ſmall ſtream from it as from a little fountain, and that with conſiderable force.

The pupa differs but little from the larva; the bunches containing the wings grow large, and begin to appear like four ſhort thick wings. It is full as lively as the larva, ſeeking and enjoying its food in the ſame manner. When arrived at its full growth, and ready to go through its laſt change, it approaches the edge of the water, and fixes itſelf firmly to a piece of wood or other ſubſtance by its claws. It remains for ſome time immoveable; the ſkin then opens down the back, and on the head; through this opening is exhibited the real head and eyes, and at length the legs; it then creeps gradually forward, drawing firſt its wings, and then the body, out of the ſkin. The wings, which are moiſt and folded, ſoon expand themſelves to their real ſize; the body is alſo extended till it has gained its proper length, which extenſion is accompliſhed by the propelling force of the circulating fluids. When the wings and limbs have acquired ſufficient ſtrength, it enters on a more noble ſtate of life: in this new ſcene it enjoys the living fragrance of the richeſt meadows, revels in delight, and, having laid the foundation for its future progeny, ſinks into an eaſy diſſolution. In its mature ſtate the dragon fly is of a ferocious diſpoſition, hovering in the air like a bird of prey, in order to feed on and deſtroy every ſpecies of fly; its appetite is groſs and voracious, not confining itſelf to ſmall flies only, but the large fleſh-fly, moths, and butterflies, are equally ſubject ed to its tyranny. See the article LIBELLULA.

The female of the *cynips* or gall inſect, which has no wings, paſſes through no transformation; while the male, which has four wings, paſſes through the pupa ſtate in order to become a fly. The principal habitude of the female is this, that after impregnation by the male, and with a view to the preſervation of a future progeny, it fixes itſelf to the branch or leaf of a tree, where it makes a puncture, which, from the gelatinous matter thrown out by the inſect, added to the ſap of the vegetable, increaſes in ſize, and becomes a true gall; here the female depoſits an egg, for which the gall firſt ſerves as a nidus, and afterwards as an habitation for the larva. See this curious proceſs deſcribed, with figures of the fly, under the article CYNIPS, vol. v. p. 519.

The *aphides*, or plant lice, to arrive at their reſpective ſtate, paſs through that of the ſemicomplete pupa, and their wings do not appear till they have quitted their pupa ſtate; but, as in all the families of the pucerons there are many which never become winged, we muſt not forget that theſe undergo no transformation, remaining always the ſame, without changing their figure, though they increaſe in ſize and change their ſkin. See the article APHIS, vol. i. p. 789.

An inſect that muſt caſt off its exuvia, or moult five times before it attains the pupa ſtate, as is the caſe with many of the caterpillars, may be conſidered as compoſed of five organized bodies incloſed within each other, and nouriſhed by common viſcera placed in the center: what the bud of the tree is to the inviſible buds it contains, ſuch is the exterior part of the caterpillar to the interior bodies it conceals in its boſom. Four of theſe bodies have the ſame eſſential ſtructure, namely, that which is peculiar to the inſect in its larva or caterpillar ſtate: the fifth body is that of the pupa. The reſpective ſtate of theſe bodies is in proportion to their diſtance from the center of the animal; thoſe that are fartheſt off have moſt conſiſtence, or unfold themſelves ſooneſt. When the exterior body has attained its full growth, that interior one which is next in order is conſiderably unfolded; it is then lodged in too narrow a compaſs, therefore it ſtretches on all ſides the ſheath which covers it; the veſſels which nouriſh the external covering, are broken by this

this violent diſtenſion, and ceaſing to act, the ſkin wrinkles and dries up; at length it opens, and the inſect comes forth with a new ſkin, and new organs. When we have thus formed the idea that all the exterior parts are inlaid, or included one within the other, the production of new organs does not appear ſo embarraſſing, being nothing more than a ſimple developement; but it is more difficult to form any conception of the changes that happen in the viſcera before and after the transformation, the various modifications they undergo eluding our reſeaches. We have already obſerved, that a little before the change the caterpillar rejects the membrane that lines the inteſtinal bag: this bowel has hitherto digeſted only groſs food, whereas it muſt hereafter digeſt that which is very delicate: a fluid that circulates in the caterpillar from the hind part towards the head, circulates a contrary way after transformation. Now if this inverſion is as real as obſervation ſeems to indicate, how amazing the change the interior parts of the animal muſt have undergone!

To give the curious reader a competent idea of the admirable ſtructure of the muſcles and interior mechaniſm of the caterpillar, we have, in the Entomology Plate II. fig. 1, exhibited an anatomical ſection of the caterpillar of the Phalæna coſſus, or goat-moth, conſiderably magnified to ſhew out its parts. The body of this caterpillar, and of inſects in general, includes four principal viſcera; the ſpinal marrow, the inteſtinal bag, the heart, and tracheal veſſels. The ſpinal marrow, or principal trunk of the nerves of inſects, is a whitiſh thread, extended the whole length from the head to the hindermoſt part, furniſhed at intervals with ſmall knots or ganglions. From theſe knots procced the nervous threads that are ſuppoſed to be the inſtruments of ſenſation and motion. On the medullary thread is placed the inteſtinal bag, which is equal to it in length; it is a long gut, in which are contained the oeſophagus, the ſtomach, and inteſtines. Down the back, and parallel to the inteſtinal bag, runs a long thin veſſel, in which may be perceived through the ſkin of the inſect alternate contractions and dilatations; this part is ſuppoſed to perform the functions of the heart. The tracheal veſſels of inſects are very ſimilar to thoſe of plants; are of the ſame ſtructure, colour, and elaſticity, and are, like them, diſperſed through the whole body.

The internal ſtructure of the caterpillar, as repreſented in the Plate, divides itſelf into twelve parts, correſponding to its twelve rings. Each of theſe rings is diſtinguiſhed from that which follows, and that preceding it, by a kind of neck, or ſmall hollow part or ſection. By conceiving a line to paſs through theſe necks, and forming boundaries to the rings, the diviſions become more apparent.

The anatomical delineation of the muſcles of the head; the two palpi; the truncated muſcles of the lower lip, and part of thoſe which give it motion; the two ganglions of the neck united; the two ſilk veſſels which form tubes from the right and left, and paſs through the center of the head; the œſophagus; the two diſſolving veſſels; the cephalic arteries; the ten abductor muſcles of the jaw; the four occipital muſcles; alſo a nerve of the firſt pair, belonging to the ganglion of the neck, may be eaſily traced by contemplating the engraving.

The muſcles of the body of inſects have neither the exterior form, nor the colour, of thoſe of larger animals. In their natural ſtate they are ſoft, and have the appearance of a jelly; they are of a greyiſh blue, and the ſilver-coloured appearance of the pulmonary veſſels, which creep over and penetrate their ſubſtance, exhibits under the microſcope a moſt beautiful ſpectacle. When the caterpillar has been ſoaked for ſome time in ſpirit of wine, they loſe their elaſticity and tranſparency, and become firm, opake, and white; the aerial veſſels diſappear. At firſt ſight they might be taken for tendons, as they are of the ſame colour, and poſſeſs almoſt the ſame luſtre. They are generally flat, and of an equal ſize throughout; the middle ſeldom differs either in colour, ſubſtance, or ſize, from the extremities. The ends are fixed to the ſkin; the reſt of the muſcle is generally free and floating; ſeveral of them branch out conſiderably; the branches extend ſometimes ſo far, that it is not always eaſy to diſcover whether they are diſtinct and ſeparate muſcles, or parts of another. They are of a moderate ſtrength; thoſe that have been ſoaked in ſpirit of wine, when examined by the microſcope, will be found to be covered with a membrane which may be ſeparated from them; they then appear to conſiſt of ſeveral parallel bands, diſpoſed according to the length of the muſcle. Theſe, when divided by the aſſiſtance of very fine needles, appear to be compoſed of ſtill ſmaller bundles of fibres, in the ſame direction; which, when examined by a very deep magnifier, and in a favourable light, appear twiſted like a ſmall cord. If the muſcles are ſeparated by means of very fine needles, in a drop of ſome fluid, we find that they are not only compoſed of fibres, membranes, and aerial veſſels, but alſo of nerves; and, from the drops of oil that may be ſeen floating on the fluid, that they are alſo furniſhed with many unctuous particles. The muſcles in the caterpillar are very numerous, exceeding by much thoſe of the human body. They occupy the greateſt part of the head; there is an amazing number at the œſophagus, the inteſtines, &c. the ſkin is as it were lined by different beds of them, placed one over the other, and ranged with wonderful ſymmetry. The number of muſcles is truly aſtoniſhing; there are 228 in the head, 1647 in the body, and 2066 in the inteſtinal tube, making in all 3941!

The ſpinal marrow and the brain of the caterpillar, ſeem to have very little relation to thoſe of man. We find in the head of that which we are deſcribing, a part which ſeems to anſwer the purpoſe of the brain, becauſe the nerves that are diſſeminated through the head are derived from it; but then this part is unprotected, and ſo ſmall, that it does not occupy one-fifth part of the head; the ſurface is ſmooth, and has neither lobes nor anfractuouſneſs; and if we call this a brain, the caterpillar may be ſaid to have thirteen, as there are twelve more ſuch parts following each other in a line; they are nearly of the ſame ſize with that in the head, and of the ſame ſubſtance; and it is from them that the nerves are diſtributed through the whole body. Leſt the idea of thirteen brains might appear abſurd, M. Lyonet has called theſe parts ganglions. The ſpinal marrow in the human ſpecies deſcends down the back, incloſed in a bony caſe; is large with reſpect to its length, and not divided into branches, diminiſhing in thickneſs in proportion as it is removed further from the brain. In the caterpillar, the ſpinal marrow goes along the belly, is not incloſed in any tube, is very ſmall, forks out at intervals, and is nearly of the ſame thickneſs throughout, except at the ganglions. The ſubſtance of the ſpinal marrow, and of the ganglions, is not near ſo tender and eaſily ſeparated as in man; it has a very great degree of tenacity, and does not break without conſiderable tenſion. The ſubſtance of the ganglions differs from that of the ſpinal marrow, as no veſſels can be diſcovered in the latter, whereas the former are full of very delicate ones. The ſkilful anatomiſt of the caterpillar has counted forty-five pair of nerves, and two ſingle ones; ſo that there are ninety-two principal nerves, whoſe ramifications are innumerable.

The tracheal arteries of the caterpillar are two large elaſtic veſſels, which, with their numerous ramifications may be preſſed cloſe together, and drawn out conſiderably, but return immediately to their uſual ſize when the tenſion ceaſes; they creep under the ſkin cloſe to the ſpiracula, one at the right ſide of the inſect, the other at the left, each of them communicating with the atmoſphere, by means of nine ſpiracula; they are nearly as long as the body, beginning at the firſt ſpiraculum, and going a little farther than the laſt, terminating in ſome branches which extend to the extremities of the body. Round

about

about each ſpiraculum the tracheal artery puſhes forth a great number of branches, which are again divided into ſmaller ones; theſe further ſubdivide, and ſpread through the whole body of the caterpillar. This veſſel and its principal branches are compoſed of three coats, which may be ſeparated one from the other. The exterior covering is a thick membrane, furniſhed with a great number of fibres, which deſcribe a vaſt variety of circles round it, communicating with each other by numerous ſhoots. The ſecond is very thin, and tranſparent; no particular veſſel is diſtinguiſhed in it. The third is compoſed of ſcaly threads, which are generally turned in a ſpiral form, and come ſo near each other, as ſcarcely to leave any interval; theſe threads are curiouſly united with the membrane which occupies the intervals, and form a tube which is always open, notwithſtanding the flexure of the veſſel. The principal tracheal veſſels branch out into 236 ſmaller ones, from which there ſpring 1326 different ramifications.

The part of the caterpillar which naturaliſts call the heart, is of a nature very different from that of larger animals. It is almoſt as long as the caterpillar itſelf, lies immediately under the ſkin at the top of the back, entering into the head, and terminating near the mouth. It is large and ſpacious towards the laſt rings of the body, and diminiſhes very much as it approaches the head, from the fourth to the twelfth diviſion; it has on both ſides, at each diviſion, an appendage, which partly covers the muſcles of the back; but, growing narrower as it approaches the lateral line, forms a number of irregular lozenge-ſhaped bodies. This muſcular tube has been deemed the heart of the caterpillar; firſt, becauſe it is generally filled with a kind of lymph, which has been ſuppoſed to be analogous to the blood of larger animals; ſecondly, becauſe in all caterpillars, whoſe ſkin is in ſome degree tranſparent, continual, regular, and alternate, dilatations and contractions may be perceived along the ſuperior line, beginning at the eleventh ring, and going on from ring to ring to the fourth, whence this veſſel has been conſidered as a file of hearts; but ſtill this viſcera ſeems to have very little relation to the heart of larger animals; we find no veſſel opening into it to anſwer the aorta, vena cava, &c. Yet it cannot be of any importance in what manner this organ be formed, any more than that of the brain, ſo that the Great Author of its ſtructure has enabled it to perform its proper office. Near the eighth diviſion are two white oblong maſſes, that join the tube of the heart; they have been called reniform bodies, becauſe they are ſomething ſimilar to a kidney in their ſhape.

The *corpus craſſum* is, with reſpect to volume, the moſt conſiderable part of the whole caterpillar; it is the firſt and only ſubſtance that is ſeen on opening it, forming a kind of ſheath, which envelopes and covers all the entrails, and introducing itſelf into the head, enters all the muſcles of the body, filling the greateſt part of the empty ſpaces in the caterpillar. It is of a milk-white colour. In its configuration it is very ſimilar to the human brain. When the different maſſes of the corpus craſſum which covers the entrails are removed, the largeſt parts are the œſophagus, the ventricle, and the large inteſtines. The *œſophagus* deſcends from the bottom of the mouth to about the fourth diviſion. The anterior part which is in the head is fleſhy, narrow, and fixed by different muſcles to the cruſtaceous parts thereof; the lower part which paſſes into the body is wider, and forms a kind of membranaceous bag, which is covered with very ſmall muſcles; near the ſtomach it is again narrower, and is as it were bridled by a ſtrong nerve, which is fixed to it at diſtant intervals. The *ventricle* begins a little above the fourth diviſion, where the œſophagus finiſhes, and terminates at the tenth diviſion; it is about ſeven times longer than it is broad; the anterior part, which is the broadeſt, is generally folded. The folds diminiſh with the bulk, in proportion as it approaches the inteſtines. An aſſemblage of nerves cover the ſurface; it is ſurrounded by a number of aerial veſſels, and opens into a tube, which M. Lyonet calls the large inteſtine.

There are three of theſe large tubes or inteſtines, each of which differs from the other ſo much, both in ſtructure and character, that they ſhould have a particular name to diſtinguiſh them. As moſt caterpillars are endued with a power or faculty of ſpinning, they are provided with two veſſels where the ſubſtance is prepared, which, when drawn out, and extended in the air, becomes a ſilken thread; theſe two veſſels are termed the ſilk-veſſels or tubes; in the caterpillar of the coſſus they are often above three inches long, and are diſtinguiſhed into three parts, the anterior, the intermediate, and poſterior. It has alſo two other veſſels, which are ſuppoſed to prepare and contain the liquor by which it diſſolves the wood on which it feeds. Such is the wonderful organization of this apparently trifling and imperfect animal. Yet the four-thouſand muſcles employed in the conſtruction of the caterpillar of the coſſus, cannot be conſidered without the deepeſt aſtoniſhment: their admirable co-ordination and junction with other parts equally numerous, yet all harmonizing and acting together as if they were eſſentially one, naturally lead the mind to conſider the nature and perfection of creation, and to perceive that it is an exhibition of the higheſt wiſdom and moſt profound omnipotence.—See Lyonet ſur la Chenille de Saule; and Theologie des Inſectes. Alſo Mr. Adams on the Microſcope, by Kanmacher.

In the Entomology Plate II. are given figures of different caterpillars, and various inſects in their larva and pupa ſtate. Fig. 2, the caterpillar of the phalæna coſſus or goat-moth, of its natural ſize, and the ſame animal as diſſected and magnified at fig. 1. The pupa of this moth is ſhewn at fig. 3. The moth itſelf is ſhewn at fig. 6, in the Entomology Plate I. Fig. 4, the ſilkworm, or caterpillar of the phalæna mori. Fig. 5, the pupa or chryſalis of the ſame moth. Fig. 6, a ſection of the cone or follicle of ſilk, in which the pupa incloſes itſelf. Fig. 7, the cone or follicle, ſhewing the moth in the act of making its way out, and juſt arrived at its imago or fly ſtate. For the phalæna mori, or ſilkworm moth, ſee the article PHALÆNA. Fig. 8, the caterpillar of the phalæna erythrinæ, in its firſt worm ſtate. Fig. 9, the ſame caterpillar, after its firſt moult. Fig. 10, the ſame after its ſecond moult. Fig. 11, the caterpillar of the papilio vanillæ, or butterfly with the ſpiral tongue, ſhewn in Plate I. fig. 6. Fig. 12, caterpillar of the atlas moth. Fig. 13, caterpillar of the Achilles butterfly. See theſe two ſuperb ſpecies in the engravings adapted to the articles PAPILIO, and PHALÆNA. Fig. 14, the larva of the muſca chamæleon. Fig. 15, the larva of the libellula or dragon fly. Fig. 16, the pupa of the ſame, with its wings beginning to evolve. Fig. 17, the palmer or caterpillar of the apis muſcorum, or humming bee. Fig. 18, the pupa of the ſame, with the rudiments of its wings. See the perfect fly, male and female, fig. 12, 13, in Plate I. Fig. 19, the larva of the oeſtrus equi, or grub called the *bot*, voided by horſes. Fig. 20, the pupa of the ſame. For the perfect fly, male and female, ſee fig. 14, 15, in Plate I. Fig. 21, the larva of the lucanus interruptus, or black beetle with yellow wings. Fig. 22, ſame in its pupa ſtate, ſhewing the rudiments of its limbs. For the perfect beetle, ſee the article LUCANUS. Fig. 23, the larva of the blatta Americana; the perfect inſects, male and female, are ſhewn at fig. 3, 4, in Plate I. Fig. 24, the larva of the bupreſtis gigantea. The perfect beetles, male and female, are exhibited at fig. 1 and 2, Plate I. Fig. 25, the larva of the termes fatale, or white ant. Fig. 26, the pupa of the ſame. See the perfect inſects, fig. 16 female, and 17 male, in Plate I. —For the natural hiſtory, and more engravings of all theſe inſects, ſee under their reſpective generic titles in this work.

Larvæ and Pupæ of the Seven Orders of Insects.

London. Published as the Act directs. Oct.r 20. 1804. by J. Wilkes.

Of the GENERATION of INSECTS.

One of the greateſt myſteries appertaining to the inſect tribes, is their mode of generation. Many ancient philoſophers imagined that inſects were produced from corrupt and putrefied ſubſtances, and thus owed their origin to mere chance. But they ſhould have taught that every degree of life muſt proceed from the fountain and ſource of all life; and that therefore inſects muſt conform to that general law which runs through the whole of animated nature, namely, that the conjunction of the male and female is neceſſary for the production and propagation of their offspring.

But though inſects are, like larger animals, for this end diſtinguiſhed into male and female, yet in ſome claſſes there appears to be a kind of mules, partaking of neither ſex, though themſelves originating from the conjunction of both; and many other particularities relative to the ſexes of inſects, ſeem equally myſterious and unaccountable: though it is moſt conſonant to reaſon that all ſuch inſects as are termed mules, neuters, or which appear of doubtful or imperfect conformation, are only ſuch whoſe parts are not yet completely evolved, and conſequently not arrived at their laſt or perfect ſtate. It is evident that this is the caſe with what are called *labourers* among the white ants.

In many inſects the male and female are with difficulty diſtinguiſhed; and in ſome they differ ſo widely, that an unſkilful perſon might eaſily take the male and female of the ſame inſect for different ſpecies; as for inſtance, in the phalæna humuli, piniaria, ruſſula, &c. The diſſimilarity is ſtill greater in thoſe inſects in which the male has wings and the female none, as in the coccus lampyris, termes fatale, phalæna antiqua, and many of the hemiptera claſs. The female of the gryllus pedeſtris is quite deſtitute of wings, and paſſed for a gryllus in its larva ſtate, until it was ſeen in copulation, which proved its maturity; for it is an eſtabliſhed fact, that no inſect can propagate, till it arrives at its laſt or perfect ſtate.—"*Pleraque inſectorum genitalia ſua intra anum habent abſcondita, et penes ſolitarios, ſed nonnulla penem habent bifidum: cancri autem et aranei geminos, quemadmodum nonnulla amphibia, et quod mirandum in loco alieno, ut cancer, ſub baſi caudæ. Aranеus mas palpos habet clavatos, qui penes ſunt, juxta os utrinque unicum, quæ clavæ ſexum nec ſpeciem diſtinguunt; et fœmina vulvas ſuas habet in abdomine juxta pectus; heic vero ſi unquam vere dixeris: res plena timoris amor, ſi enim procus inauſpicato acceſſerit fœmina ipſum devorat, quod etiam fit, ſi non ſtatim ſe retraxerit. Libellula fœmina genitale ſuum ſub apice gerit caudæ, et mas ſub pectore, adeo ut cum mas collum fœmina forcipe caudæ arripit, illa caudam ſuam pectori ejus adplicet, ſicque peculiari ratione connexæ volitent.*"

Inſects are either oviparous, or viviparous; in other words, the ſpecies is perpetuated either by their laying of eggs, or bringing forth their young alive. The former is the more general caſe; there are but few inſtances of the latter. Thoſe inſects which paſs through the different transformations already deſcribed, cannot propagate, therefore, till they arrive at their winged ſtate; and we believe there is ſeldom any conjunction of the ſexes in other claſſes till they have moulted, or put off their laſt ſkin, the cancri and monoculi excepted. Reaumur, tom. iv. p. 415, mentions ſeveral ſpecies of two-winged flies that are viviparous, bringing forth worms, which are afterwards tranſformed into flies. The womb of one of theſe is ſingularly curious; it is formed of a band rolled up in a ſpiral form, and about two inches and a half in length; ſo that it is ſeven or eight times longer than the body of the fly, and compoſed of worms placed one on the ſide of the other with wonderful art; and are many thouſands in number.

Among the *aphides*, or pucerons, many bring forth their young alive in ſummer, but in autumn they depoſit eggs upon the branches and bark of trees. The generative habitudes of this genus are very ſingular: an aphis or puceron, hatched from a roſe-leaf, and brought up in the moſt perfect ſolitude from the very moment of its birth, in a few days will be found the parent of a numerous family; repeat the experiment on one of the individuals of this new family, and the ſecond generation will multiply like its parent; and this is found to be the caſe for ten generations, when impregnation by the male appears again neceſſary for another ten years procreation. See theſe facts explained under the article APHIS, vol. i. p. 789.

However ſingular the generation and production of the aphides may appear, that of bees is not leſs ſo.—This little republic has at all times gained univerſal eſteem and admiration; and, though they have attracted the attention of the moſt ingenious inquirers into nature, yet the mode of propagating their ſpecies for a long time baffled the ingenuity of ages, and rendered their attempts to diſcover it abortive. Reaumur was the firſt who removed the veil, and explained their manner of generating: he diſcovered that the queen bee was the only female belonging to a ſwarm or hive, and the mother of the next generation; that the drones are the males by which ſhe is fecundated, and that the working bees, or thoſe that collect wax on the flowers, that knead it, and form from it the combs and cells, which they afterwards fill with honey, are at the time of neither ſex, but *neuters*; and that the neuters afterwards become perfect. The queen bee is diſtinguiſhed by her ſize, being larger than the working bee or the drone. See a full account of their mode of propagation, habits, and economy; with figures of the male, female, and neuters; their various parts, combs, &c. under APIS, vol. i. p. 792—798.

Divine Providence inſtructs the inſects in a moſt remarkable manner to depoſit their eggs, not only in ſafety from their numerous enemies, but alſo in ſituations where a ſufficient quantity of food is on the ſpot to ſupport and nouriſh the larva immediately on breaking the ſhell. The gnat, the ephemera, the phryganea, the libellula, hover over the water all day to drop their eggs, which are hatched in the water, and continue there all the time they are in the larva form. The maſs formed by the gnat reſembles a little veſſel ſet afloat by the inſect; each egg is in the form of a keel, and curiouſly connected together. The gnat lays but one egg at a time, which ſhe depoſits on the water in a very ingenious and ſimple manner; ſhe ſtretches her legs out, and croſſes them, thus forming an angle to receive and hold the firſt egg; a ſecond egg is ſoon placed next the firſt; then a third, and ſo on, till the baſe is capable of ſupporting itſelf; theſe, as they come to maturity, ſink deeper. The ſpawn of this inſect is ſometimes above an inch long, and one-eighth of an inch in diameter, and tied by a little ſtem or ſtalk to ſome ſtick or ſtone. Sometimes they are laid in a ſingle, ſometimes in a double, ſpiral line; ſometimes tranſverſely. Many of the moths cover their offſpring with a thick bed of hair, which they gather from their own body; while others cover them with a glutinous compoſition, which, when hard, protects them from moiſture, rain, and cold. The gall-flies, it has been obſerved, know how to open the nerves of the leaves, to depoſit their eggs in a place which afterwards ſerves them for a lodging and a magazine of food. The ſolitary bees and waſps prepare an habitation for their little ones in the earth, placing there a proper quantity of food for them, when they proceed from the egg. The voracious ſpider is careful of its eggs; the wolf ſpider carries them on its back in a little bag formed of its ſilk, it cannot be ſeparated from them but by violence, and exhibits the moſt marked ſigns of uneaſineſs when deprived of them: a circumſtance the more remarkable, as they love to deſtroy each other, and even carry on their courtſhips with a diffidence and caution unknown in any other ſpecies of animals. See the article ARANEA. The paternal affection and care of the ant is alſo well known. They are not ſatisfied with placing their eggs in ſituations made on purpoſe, and to raiſe or rear them till they come to the nymph or pupa ſtate, but they even extend their care to the pupæ themſelves, removing

them from their neſt to the ſurface of the earth, whenever the weather is fine, that they may receive the benignant influence of the ſun, carrying them back again as ſoon as the air begins to grow cold. If any accident diſturb their neſt, and diſperſe the pupæ, they manifeſt the greateſt ſigns of diſtreſs, ſeeking thoſe which are loſt and ſcattered, placing them in ſome ſheltered place while they repair the neſt, when they again tranſport them to it.

The fecundity of inſects exceeds in an aſtoniſhing degree that of all the productions of nature. Reaumur calculated the fecundity of the queen bee as follows: he found that ſhe laid in the two months of March and April 12,000 eggs, ſo that the ſwarm which left the hive in May, conſiſted of near 12,000 bees, all produced from one mother: but this calculation falls ſhort of that which was made by Leeuwenhoek on a fly, whoſe larva feeds on fleſh, putrid carcaſes, &c. which multiply prodigiouſly, and in a ſhort ſpace of time. One of theſe laid 144 eggs, from which he got as many flies in the firſt month; ſo that, ſuppoſing one-half of theſe to be females, in the third month we ſhall find 746,496, all produced in three months from one fly. M. Lyonet, in order to inveſtigate the generation of a moth, out of 350 eggs produced by a ſingle female, took only 80, from which he obtained, when arrived at their perfect ſtate, 15 females; from whence he deduces the following computation: if 80 eggs give 15 females, the whole brood of 350 would have produced 65; theſe 65, ſuppoſing them as fertile as their mother, would have produced 22,750 caterpillars, among which there would have been at leaſt 4265 females, who would have produced for the third generation 1,492,750 caterpillars. This number would have been much larger, if the number of females among thoſe which were ſelected by M. Lyonet had chanced to have been greater. M. de Geer counted in the belly of a moth 480 eggs; reducing theſe to 400, if ſuppoſing one-fourth only of theſe to be females and as fruitful as their mother, they will give birth to 40,000 caterpillars for the ſecond generation; and for the third, ſuppoſing all things equal, four millions of caterpillars. It is not ſurpriſing, therefore, that they are found ſo numerous in years that are favourable to their propagation. But the Author of Nature has for our ſakes limited this abundant multiplication, and wiſely ordained, that thoſe ſpecies which are the moſt numerous ſhall afford food to the greateſt number of birds, fiſhes, &c. who, though conſtantly employed on the deſtruction of individuals, are unable to effect that of any of the ſpecies; by which means an equilibrium is preſerved, and no one ſpecies preponderates. Few inſects live long after their laſt transformation, but their ſpecies are continued by their amazing fecundity; their growth is completed, and their parts hardened ſooner than thoſe of larger animals, and the duration of their exiſtence is proportionably limited.

In the amours of the inſect tribes, it is extremely curious to obſerve the avidity with which the male and female approach each other. The facility with which the males ſeek out the females, is hardly credible. If a female butterfly be concealed in a box, and there be any males within half a mile of the place, they will directly fly to the ſpot, and hover over it. In ſome genera the males are not ſo active, but are eagerly ſought and careſſed by the females: the incitements of the queen bee to ſtimulate the paſſions of the male, are truly wonderful: ſee APIS, vol. i. p. 793. Their mode of contact is by intromiſſion; an operation which with them requires much time effectually to accompliſh; after which the congreſs continues for many hours. The butterfly and moth are often ſeen in coitu for a whole day; and the common chafer beetle for upwards of twenty-four hours. But this ſurpriſing duration of the ſexual embrace appears to be given them, becauſe it is perhaps the only one of their lives, and ſerves to fecundate the whole maſs of eggs in the ovarium of the female. The male is afterwards ſeen retiring in a very languid ſtate, to ſome obſcure hiding-place, where it ſoon falls a prey to birds or reptiles; the female ſeeks a nidus wherein to depoſit her impregnated ſtore, after which ſhe diſappears, and in like manner falls a victim to death; the ends of her exiſtence having been thus fulfilled. Were not this the caſe, inſects would multiply in ſuch countleſs myriads, that the whole expanſe of our globe, and its ſurrounding atmoſphere, would be found too limited to afford them ſufficient room. The female, by a very ſurpriſing inſtinct, almoſt unerringly depoſits her eggs where ſhe is certain her progeny will be ſafely hatched, and ſupplied with ſuch food, and ſuch means of paſſing through their transformations, as nature has ordained for them. There are a great number of inſects which reject vegetable matter, and ſeek a nidus for their eggs in putrid fleſh, or in living animals. But Reaumur informs us, that thoſe inſects which prefer dead fleſh never attack living animals; the fleſh-fly depoſits her eggs in the bodies of dead carcaſes, where her progeny receive the nouriſhment beſt adapted for them; but this fly never attempts to lay her eggs in the fleſh of ſound and living animals.

The inſects which principally depoſit their impregnated eggs in the fleſh of living animals, and which have not a little perplexed and embarraſſed the reſearches of both ancient and modern naturaliſts, before they could diſcover and aſcertain their real habitudes, are the oeſtri ſpecies, commonly called *gad-fly*. The oeſtrus bovis depoſits its eggs in the back of cattle, under the ſkin; which as they are hatched into larvæ, produce a purulent tumour. By the pain it inflicts, by making a nidus for its eggs, an extreme terror and agitation is occaſioned, and the object of the attack runs bellowing wildly about, with its tail erect, and in a tremulous motion, and communicates the agitation to the whole affrighted herd. The larva is brown, having eleven ſegments, with tranſverſe lines. When ſufficiently matured, they drop from the nidus, to prepare for their winged ſtate. The oeſtrus equi depoſits its eggs on the hairs or cuticle of horſes, and always on thoſe parts which can be licked with the tongue; theſe, in the egg or larva ſtate, are conveyed with the tongue of the horſe, by licking the irritated part, into the ſtomach; and paſſing through the inteſtines with the food, when ſufficiently matured, are diſcharged with the dung. Theſe larvæ are commonly known by the name of bots. See the engraving, fig. 19. The haemorrhoidalis is another kind of equi: it depoſits its eggs on the lips of horſes, occaſioning a titillation, which cauſes the animal, when attacked by it, to move its head violently up and down, and gallop about with every appearance of diſtreſs. The larvæ are conveyed through the inteſtines like thoſe of the other ſpecies.—The oeſtrus ovis depoſits its eggs on the inner margin of the noſtrils of ſheep, occaſioning them to ſhake their heads violently, and hide their noſes in duſt or gravel. The larvæ crawl up into the frontal ſinuſes or horns, and when full fed, are again diſcharged through the noſtrils, to prepare for the fly ſtate.—The oeſtrus cuniculi, in like manner depoſits its eggs in the ſkins of hares and rabbits. But the moſt ſingular of all, is the oeſtrus hominis, which depoſits its eggs under the ſkin on the bellies of the Indians in South America, who go nearly naked. The larva, if diſturbed, penetrates deeper, and produces an ulcer, which not unfrequently becomes fatal.—See the natural hiſtory of theſe inſects, under the article OESTRUS, with correct engravings of the different ſpecies.

Neither the larva, pupa, or even the egg-ſtate of ſome inſects are exempt from the attacks of others, who depoſit their eggs in like manner upon them; theſe, after having paſſed through the uſual transformation, become what is termed the *ichneumon* fly. An ingenious entomologiſt deſcribes the operation as follows: "Obſerving ſome caterpillars feeding on a leaf, my attention was attracted by a little ichneumon fly, which appeared as if deliberating where to ſettle. I was ſurprized to ſee the caterpillars endeavouring by various contortions to get out of its way, and more ſo whenever the fly poiſed on the wing, as if going to drop. At length the paraſite made its choice, and

and ſeated itſelf on the back of one of the largeſt of the cluſter. It was in vain that the caterpillar endeavoured to diſlodge the enemy; and its anguiſh at intervals appeared intolerable, in conſequence of the wounds given by the fly. At every wound the poor caterpillar wreathed and twiſted its whole frame, endeavouring to diſengage the enemy, ſometimes aiming its mouth towards the place, but it was all in vain; its little tormentor ſtill kept its place. When it had inflicted thirty or forty wounds, it took its flight with a viſible triumph; in each of theſe wounds the ichneumon had depoſited an egg. I took the caterpillar home, to obſerve the progreſs of the eggs which were thus placed in its body, taking care to give it a freſh ſupply of leaves from time to time; it recovered to all appearance from the wounds, and from that time, for the ſpace of four or five days, ſeemed to feed with its uſual avidity. The eggs were all hatched into ſmall oblong voracious worms, which fed from the moment of their appearance on the fleſh of the caterpillar, in whoſe body they were incloſed, and ſeemingly without wounding the organs of reſpiration or digeſtion; and when they had arrived at their full growth, they ate their way out of the ſides of the animal. Theſe are what have vulgarly been called *caterpillar-caters*. The caterpillar thus attacked by the larva of the ichneumon never eſcapes, its deſtruction is infallible; but then its life is not taken away at once; the larva, while it is feeding thereon, knows how to ſpare the parts which are eſſential to life, becauſe its own is at that time tied up in that of the caterpillar. No butterfly is produced from the caterpillar; the worms that feed on it are no ſooner out of its body, than every one ſpins its own web, and under this they paſs the pupa ſtate, in order to introduce them to their winged form." The number of inſects which feed upon others, nay, ſome even upon their own ſpecies, is very great: it is among theſe that we find the traces of the greateſt art and cunning, as well in attack as defence. Some indeed uſe main force alone; as does the larva of the cimex merianæ of Surinam, which ſeizes and devours young toads and frogs. See the article CIMEX, and the correſponding engraving, vol. iv. p. 598. Moſt perſons are acquainted with the dexterous arts of the ſpider, the curious conſtruction of the web he ſpins, and the central poſition he takes, in order to watch more effectually the leaſt motion that may be communicated to the meſhes of its net. For their natural hiſtory, particularly of the *tarantula*, ſee the article ARANEA, vol. ii. p. 30—35, and its correſponding engravings.

We cannot diſmiſs this ſubject without remarking on the extraordinary community and generation of the *termes*, or white ants, inſects of the aptera claſs, and far exceeding in wiſdom and policy of the bee, the ant, or the beaver. They are inhabitants of India, Africa, and South America. They build pyramidal ſtructures, ten or twelve feet in height, and divided into appropriate apartments, magazines for proviſions, arched chambers, and galleries of communication. Theſe are ſo firmly cemented, that they eaſily bear four men to ſtand upon them; and in the plains of Senegal, appear like the villages of the native inhabitants. With wonderful dexterity and rapidity they deſtroy food, furniture, books, clothes, and timber, of whatever magnitude, leaving the ſurface a mere ſhell. The larva are ſmall, being not half an inch long, ſix-footed, with a roundiſh teſtaceous head, as ſhewn, fig. 25, in the preceding plate; mandibles ſhort, ſtrong, and toothed; antennæ as long as the thorax, and ovate abdomen. Theſe, like the neutral bees, are only the labourers, who build the ſtructures, procure proviſions for the males and females, and take care of the eggs; they are alſo the moſt numerous. When they reach the pupa ſtate, they are ſtill active, but never work; ſerve as ſuperintendants over the labourers, or as guards to defend their habitations from intruſion and violence. Whenever a breach is made in the dwelling, they ruſh forward and defend the entrance with great ferocity; ſome of them beating with their mandibles againſt any hard ſubſtance, as a ſignal to the other guards, or as encouragement to the labourers; they then retire, and are ſucceeded by the labourers, each with a burthen of tempered mortar in his mouth, and who diligently ſet about to repair whatever injury has been ſuſtained. One of theſe attends every ſix or eight hundred labourers who are building a wall, taking no active part himſelf, but frequently making the ſignal above-mentioned, which is conſtantly anſwered by a loud hiſs from all the labourers, who then evidently redouble their diligence. See this ſtate of the inſect, fig. 26, in the preceding plate.

The male and female are nearly alike; but the male, after paſſing from the pupa ſtate, is furniſhed with four long horizontal wings. See the female, fig. 16, and the male, fig. 17, in the Entomology Plate I. Theſe fly abroad in the night; but ſoon after ſun-riſe, the wings become dry, and they fall on the ground, and are devoured by birds, or fought after by the inhabitants, who roaſt and eat them with great avidity. After impregnation, the abdomen of the female grows to a prodigious bulk, exceeding the reſt of her body nearly two thouſand times: it is then veſicular and white, with tranſverſe brown ſpots, and an undulate or ſlightly lobed margin. In this ſtate it contains an immenſe number of ſmall round brown eggs, which are protruded to the amount of eight thouſand in twenty-four hours. Theſe are inſtantly taken up by the labourers, and conveyed to ſeparate chambers, where after they are hatched, the young are attended and provided for, till they are able to ſhift for themſelves, and take their ſhare in the ſervices of the community.—For their natural hiſtory, and figures of their ſpecies and huts, ſee the article TERMES.

Yet the works of theſe buſy inſects are nothing to the immenſe labours of the little animals which produce the coral rocks, and which form cluſters of iſlands in the ſea. See the articles CORAL, CORAL-ROCKS, and CORALLINA, with the coreſponding engraving, vol. v. p. 187—193.

On the *revivification* of torpid and drowned inſects, many curious facts have been related. Common flies, ſmall beetles, ſpiders, moths, bugs, &c. after being drowned in ſpirit of wine, and continuing apparently dead, have been reſtored to life merely by being thrown among wood-aſhes ſlightly warm. While Dr. Franklin reſided in France, he received from America a quantity of Madeira wine which had been bottled in Virginia. At the bottom of ſome of the bottles he found a few dead flies, which he expoſed to the warm ſun, it being then the month of July; and in leſs than three hours theſe apparently dead animals recovered life, which had been ſo long ſuſpended. At firſt they appeared as if convulſed; they then raiſed themſelves on their legs, waſhed their eyes with their fore feet, dreſſed their wings with thoſe behind, and began in a little time to fly about.

But the moſt extraordinary inſtance of revivification that we have ſeen recorded, is the following: In the warmer parts of France there is an inſect very deſtructive to rye, which ſeems to begin its operations at the root of the plant, and gradually to proceed upwards to the ear. If the plant be completely dried while the inſect is in the root or ſtem, the animal is irrecoverably killed; but after it has reached the grain, the caſe is very different. There have been inſtances, which are noticed in the academy of ſciences at Paris, of theſe inſects being brought to life in a quarter of an hour, by a little warm water, after the grains, in which they were lodged, had been kept dry for thirty years!

Thoſe who wiſh to take inſects for the purpoſe of forming a collection, ſhould be provided with a gauze clap-net conſtructed for that purpoſe. When they are taken, ſtick a pin through the middle of one of the hard wings, and paſs it through the body. They may be killed without injury to their colours or beauty, by immerſion in hot water, or in ſpirit of wine; then ſtick them on a piece of cork, and afterwards carefully place

their legs in a creeping poſition, and let them continue expoſed to the air until all the moiſture is evaporated from their bodies.

Butterflies and moths, as well as all flies with membranaceous wings, ſhould be taken with great care, leſt the beauty of their plumage be injured. When taken, run a pin through the thorax or ſhoulders, between the fore-wings. After this is done, the wings ſhould be expanded, and kept ſo by the preſſure of ſmall ſlips of paper for a day or two. Moths expand their wings when at reſt, and they will naturally take that poſition.

The beſt method of procuring the moſt perfect butterflies is to find out, if poſſible, the larva or caterpillar of each, by examining the plants, ſhrubs, or trees, they uſually feed upon, or by beating the ſhrubs and trees with long poles, and thereby ſhaking the caterpillars into a ſheet ſpread underneath to receive them; to put them into boxes covered with thin canvas, gauze, or cat-gut, and to feed them with the freſh leaves of the tree or herb on which they are found; when they are full grown, they will go into the pupa or chryſalis ſtate, and require then no other care till they come out perfect butterflies.

Moths might likewiſe be procured more perfect, by collecting the caterpillars, and breeding them in the ſame manner. It may be neceſſary to obſerve, that in breeding theſe kinds of inſects, ſome earth ſhould be put into the boxes, as likewiſe ſome rotten wood in the corners; becauſe, when the caterpillars change into the pupa ſtate, ſome go into the earth, and continue under ground for many months before they come out into the moth ſtate; and ſome cover themſelves with a hard cruſt, made up of ſmall pieces of rotten wood.

After the inſects are properly dried, they may be placed in the cabinet or boxes where they are to remain: theſe boxes ſhould be kept dry; and alſo made to ſhut very cloſe, to prevent ſmall inſects from injuring them; the bottoms of the boxes ſhould be covered with green wax, over which paper may be laid; or, which is better, lined with cork, well impregnated with a ſolution of corroſive ſublimate, in a ſaturated ſolution of crude ſal-ammoniac in water, an ounce of which will diſſolve twenty ſcruples of the ſublimate. The fineſt collections have been ruined by the depredations of ſmall inſects; it is impoſſible, therefore, to have the cabinets too ſecure. Such inſects as are thus attacked may be fumigated with ſulphur; if this prove ineffectual, they may be immerſed in ſpirit of wine, without injury. But baking the collection in an oven is the moſt effectual method of extirpating theſe enemies when too numerous for partial applications.—To deſtroy caterpillars and other inſects in gardens, orchards, &c. ſee the article CATERPILLAR, vol. iii. p. 903.

ENTRAC'QUE, a town of Italy, in the principality of Piedmont, on the Geſſo: five miles ſouth-ſouth-eaſt of Demont.

ENTRAI'GUES, a town of France, in the department of the Aveiron, and chief place of a canton, in the diſtrict of Mur de Barres: ſix leagues north of Rhodez.

ENTRAI'GUES, a town of France, in the department of the Iſere, and chief place of a canton, in the diſtrict of Grenoble: twenty miles ſouth-eaſt of Grenoble.

ENTRA'IL, *ſ.* [from *entrelas*, Fr.] A knot:

Whoſe folds diſplaid
Were ſtretcht now forth at length without *entraile*. *Spenſer.*

To ENTRA'IL, *v. a.* [*intralciare*, Ital.] To mingle; to interweave; to diverſify.

Over him, art ſtriving to compare
With nature, did an arbor green diſpred,
Framed of wanton ivy, flow'ring fair,
Through which the fragrant eglantine did ſpread,
His prickling arms *entrail'd* with roſes red. *Spenſer.*

To twiſt together:

Before they faſtened were under her knee
In a rich jewell, and therein *entrayl'd*
The ends of all the knots. *Spenſer.*

EN'TRAILS, *ſ.* without a ſingular, [*entrailles*, Fr. ἐντερα, Gr.] The inteſtines; the inward parts; the guts:

What, hath thy fiery heart ſo parch'd thine *entrails*,
That not a tear can fall? *Shakeſpeare.*

The internal parts.—He had brought to light but little of that treaſure, that lay ſo long hid in the dark *entrails* of America. *Locke.*

The earth hath loſt
Moſt of her ribs, as *entrails*; being now
Wounded no leſs for marble than for gold. *Ben Jonſon.*

ENTRAI'NS, a town of France, in the department of Nyèvre, and chief place of a canton, in the diſtrict of Clamecy: three leagues and a half weſt of Clamecy.

EN'TRANCE, *ſ.* [*entrant*, Fr.] The power of entering into a place.—Where diligence opens the door of the underſtanding, and impartially keeps it, truth is ſure to find both an *entrance* and a welcome too. *South.*—The act of entering:

All the world's a ſtage,
And all the men and women merely players;
They have their exits and their *entrances*. *Shakeſpeare.*

The paſſage by which a place is entered; avenue.—Palladio did conclude, that the principal entrance was never to be regulated by any certain dimenſions, but by the dignity of the maſter. *Wotton.*—Initiation; commencement.—This is that which, at firſt *entrance*, baulks and cools them. *Locke.*—Intellectual ingreſs; knowledge.—He that travelleth a country before he hath ſome *entrance* into the language, goeth to ſchool, and not to travel. *Bacon.*—The act of taking poſſeſſion of an office or dignity.—From the firſt *entrance* of this king to his reign, never was king either more loving, or better beloved. *Hayward.*—The beginning of any thing.—St. Auguſtine in the *entrance* of one of his ſermons, makes a kind of apology. *Hakewill.*

To ENTRA'NCE, *v. n.* [from *trance*; *tranſe*, Fr. from *tranſeo*, Lat. to paſs over; to paſs for a time from one region to another.] To put into a trance; to withdraw the ſoul wholly to other regions, while the body appears to lie in dead ſleep. To put into an extaſy; to make inſenſible of preſent objects.—With delight I was *entranced*, and carried ſo far from myſelf, as that I am ſorry that you ended ſo ſoon. *Spenſer.*

And I ſo raviſh'd with her heav'nly note,
I ſtood *entranc'd*, and had no room for thought;
But all o'erpow'r'd with eccſtaſy of bliſs,
Was in a pleaſing dream of paradiſe. *Dryden.*

To ENTRA'P, *v. a.* To enſnare; to catch in a trap or ſnare:

Take heed, mine eyes, how ye do ſtare
Henceforth too raſhly on that guileful net;
In which, if ever eyes *entrapped* are,
Out of her bands ye by no means ſhall get. *Spenſer.*

To involve unexpectedly in difficulties or diſtreſſes; to entangle.—He ſought to *entrap* me by intelligence. *Shakeſpeare.*

Misfortune waits advantage to *entrap*
The man moſt wary, in her whelming lap. *Spenſer.*

To take advantage of.—An injurious perſon lies in wait to *entrap* thee in thy words. *Eccleſ.* viii. 11.

ENTRA'VE, or ENTRAVON, *ſ.* in the manege, a lock for a horſe's paſtern.

EN'TRE AMBOS OS RIOS, a town of Portugal, in the province of Entre Duero e Minho: eight miles ſouth-ſouth-weſt of Amarante.

ENTRE DUERO E MINHO, a province of Portugal, bounded on the north by Galicia, a province of Spain, on the eaſt by the province of Tra-los-Montes and Spain, on the ſouth by the province of Beira, from which it is ſeparated

parated by the river Duero, and on the weſt by the Atlantic. It takes its name from its ſituation between the rivers Duero and Minho, the latter of which waters part of its northern borders, as the former bounds the ſouth; about ſixty miles from north to ſouth, and thirty-five from eaſt to weſt. The ſoil is fertile, and the air pure and healthy. It produces corn, wine, oil, and flax in abundance, with great numbers of ſheep, and plenty of game and fiſh. It is divided into ſix juriſdictions, which contain 1460 churches, 963 pariſhes, 1130 convents, and 504,000 inhabitants; it has ſeveral ſea-ports ſituated on navigable rivers, which render it very commercial. The principal towns are Braga, Porto, Viana, Guimaraens, Amarante, Moncao, Ponte de Lima; the principal rivers are the Minho, Lima, Cavado, Tamega, and Duero.

To ENTRE'AT, *v. a.* [*traiter*, Fr.] To petition; to ſolicit; to importune.—Iſaac *entreated* the Lord for his wife. *Gen.* xxv. 21.—To prevail upon by ſolicitation.—The lord was *entreated* of him, and Rebecca his wife conceived. *Gen.* xxv. 21.—To treat or uſe well or ill.—Whereas thy ſervant worketh truly, *entreat* him not evil. *Eccleſ.* vii. 20.

Well I *entreated* her, who well deſerv'd,
I call'd her often; for ſhe always ſerv'd:
Uſe made her perſon eaſy to my ſight,
And eaſe inſenſibly produc'd delight. *Prior.*

To entertain; to amuſe. *Not uſed.*

My lord, I muſt *entreat* the time alone.
God ſhield I ſhould diſturb devotion. *Shakeſpeare.*

To entertain; to receive. *Not in uſe:*

The garden of Proſerpina this hight;
And in the midſt thereof, a ſilver ſeat,
With a thick arbour goodly overdight,
In which ſhe often us'd, from open heat,
Herſelf to ſhroud, and pleaſures to *entreat*. *Spenſer.*

To ENTRE'AT, *v. n.* To offer a treaty or compact. *Not uſed.*—Alexander was the firſt that *entreated* peace with them. *Mac.*—To treat, to diſcourſe. *Not uſed.*—The moſt admirable myſtery of nature is the turning of iron, touched with the loadſtone, toward the north pole, of which I ſhall have further occaſion to *entreat*. *Hakewill.*—To make a petition.—They charged me, on pain of perpetual diſpleaſure, neither to ſpeak of him, *entreat* for him, or any way ſuſtain him. *Shakeſpeare.*

ENTREAT'ANCE, *ſ.* Petition; entreaty; ſolicitation. *Not uſed:*

Theſe two *entreatance* made they might be heard,
Nor was their juſt petition long deny'd. *Fairfax.*

ENTRE'ATY, *ſ.* Petition; prayer; ſolicitation; ſupplication; requeſt:

If my weak oratory
Can from his mother win the duke of York,
Anon expect him here; but if ſhe be
Obdurate to *entreaties*, God forbid
We ſhould infringe the holy privilege
Of ſanctuary. *Shakeſpeare.*

Treatment:

Yet if thoſe cunning palates hither come,
They ſhall find gueſts' *entreaty*, and good room. *B. Jonſon.*

ENTRECASTEAU'X, a town of France, in the department of the Var, and chief place of a canton, in the diſtrict of Barjols: ten miles eaſt of Barjols.

ENTREME'TS, *ſ.* [Fr.] Small plates ſet between the main diſhes.—Chards of beet are plants of white beet tranſplanted, producing great tops, which, in the midſt, have a large white main ſhoot, which is the true chard uſed in pottages and *entremets*. *Mortimer.*

EN'TREPAS, *ſ.* in the manege, a broken pace, a kind of amble.

ENTRESO'LE, *ſ.* in architecture, a kind of little ſtory, raiſed on another ſtory.

ENTREVAU'X, a town of France, in the department of the Lower Alps, and chief place of a canton, in the diſtrict of Caſtellane, on the Var; built near the ruins of the ancient Glandeves: five leagues north-eaſt of Caſtellane.

EN'TROCHUS, *ſ.* [from ἐν, and τροχος, a wheel.] A trochite or jointed petrefaction, found in clay-pits, in the ſhape of a wheel.—ENTROCHI, are a genus of extraneous foſſils, uſually of about an inch in length, and made up of a number of round joints, which, when ſeparate and looſe, are called trochitæ: they are compoſed of the ſame kind of plated ſpar with the foſſil ſhells of the echini, which is uſually of a blueiſh grey colour; and are very bright where freſh broken: they are all ſtriated from the centre to the circumference, and have a cavity in the middle. They ſeem to be the petrified arms of that ſingular ſpecies of the ſea ſtar-fiſh, called Stella arboreſcens.

EN'TRY, *ſ.* [*entrée*, Fr.] The paſſage by which any one enters a houſe.—Some there are that know the reſorts and falls of buſineſs, that cannot ſink into the main of it; like a houſe that hath convenient ſtairs and *entries*, but never a fair room. *Bacon.*

A ſtraight long *entry* to the temple led,
Blind with high walls, and horror over head. *Dryden.*

The act of entrance; ingreſs.—The lake of Conſtance is formed by the *entry* of the Rhine. *Addiſon.*—By the *entry* of the chyle and air into the blood, by the lacteals, the animal may again revive. *Arbuthnot.*—The act of regiſtering or ſetting down in writing.—A notary made an *entry* of this act. *Bacon.*—The act of entering publicly into any city.—The day being come, he made his *entry*: he was a man of middle ſtature and age, and comely. *Bacon.*—A muſical air.—Among the different airs (ſuch as ſonatas, *entrys*, and ſarabands) there are different and diſtinct ſpecies. *Shafteſbury.*

EN'TRY, in law, is the taking poſſeſſion of lands or tenements, where a man hath title of entry: and it is alſo uſed for a writ of poſſeſſion. This entry into lands, is where any man enters into or takes poſſeſſion of any lands, &c. in his proper perſon; and is an actual entry when made by a man's ſelf, or by attorney by warrant from him that hath the right; or it is an entry in law, for a continual claim is an entry implied by law, and has the ſame force with it. *Lit.* 419. There is a right of entry, when the party claiming may for his remedy either enter into the land, or have an action to recover it: and a title of entry, where one hath lawful entry given him in the lands, which another hath, but has no action to recover till he hath entered. *Plowd.* 558. *Finch's Law*, 105.

Entry, may be defined to be an extrajudicial and ſummary remedy, againſt certain ſpecies of injury by ouſter, uſed by the legal owner, when another perſon who hath no right, hath previouſly taken poſſeſſion of lands or tenements. In this caſe, the party entitled may make a formal but peaceable entry thereon, declaring that thereby he takes poſſeſſion; which notorious act of ownerſhip, is equivalent to a feodal inveſtiture by the lord: or he may enter on any part of it in the ſame county, declaring it to be in the name of the whole. But if it lies in different counties, he muſt make different entries; for the notoriety of ſuch entry or claim to the pares or freeholders of Weſtmoreland, is not any notoriety to the pares of freeholders of Suſſex. Alſo if there be two diſſeiſors, the party diſſeiſed muſt make his entry on both; or if one diſſeiſor has conveyed the lands with livery or two diſtinct feoffees, entry muſt be made on both. *Co. Lit.* 252. For as their ſeiſin is diſtinct, ſo alſo muſt be the act which deveſts that ſeiſin. If the claimant be deterred from entering by menaces or bodily fear, he may make claim as near to the eſtate as he can, with the like forms and ſolemnities: which claim is in force for only a year and a day. And this claim, if it be repeated once in the ſpace of every year and day, (which is called continual claim,) has the

ſame effect with, and in all reſpects amounts to, a legal entry. *Ibid.* § 419. See the article CLAIM. Such an entry gives a man ſeiſin; or puts into immediate poſſeſſion, him that hath right of entry on the eſtate; and thereby makes him complete owner, and capable of conveying it from himſelf by either deſcent or purchaſe. *Co. Lit.* 15.

This remedy by entry takes place in three only of the five ſpecies of ouſter, viz. abatement, intruſion, and diſſeiſin; for, as in theſe the original entry of the wrong-doer was unlawful, they may therefore be remedied by the mere entry of him who hath right. But, upon a diſcontinuance, or deforcement, the owner of the eſtate cannot enter, but is driven to his action: for herein the original entry being lawful, and thereby an apparent right of poſſeſſion being gained, the law will not ſuffer that right to be overthrown by the mere act or entry of the claimant. Yet a man may enter on his tenant by ſufferance: for ſuch tenant hath no freehold, but only a bare poſſeſſion; which may be defeated, like a tenancy at will, by the mere entry of the owner. But if the owner thinks it more expedient to ſuppoſe or admit ſuch tenant to have gained a tortious freehold, he is then remediable by writ of entry, *ad terminum qui præterit.* 1 *Inſt.* 57.

On the other hand, in caſe of abatement, intruſion, or diſſeiſin, where entries are generally lawful, this right of entry may be *tolled*, that is, taken away, by deſcent. Deſcents which take away entries, are when any one, ſeiſed by any means whatſoever of the inheritance of a corporeal hereditament, dies, whereby the ſame deſcends to his heir: in this caſe, however feeble the right of the anceſtor might be, the entry of any other perſon who claims title to the freehold is taken away; and he cannot recover poſſeſſion againſt the heir by this ſummary method, but is driven to his action to gain a legal ſeiſin of the eſtate. *Lit.* 385. In general therefore, no man can recover poſſeſſion by mere entry on lands, which another hath by deſcent. Yet this rule hath ſome exceptions; eſpecially if the claimant were under any legal diſabilities, during the life of the anceſtor, either of infancy, coverture, impriſonment, inſanity, or being out of the realm: in all which caſes, there is no neglect or laches in the claimant, and therefore no deſcent ſhall bar, or take away his entry. *Co. Lit.* 246. And this title of taking away entries by deſcent, is ſtill farther narrowed by 32 Hen. VIII. c. 33; which enacts, that if any perſon diſſeiſes or turns another out of poſſeſſion, no deſcent to the heir of the diſſeiſor ſhall take away the entry of him that has right to the land, unleſs the diſſeiſor had peaceable poſſeſſion five years next after the diſſeiſin. But the ſtatute, on feodal reaſons, does not extend to any feoffee or donee of the diſſeiſor, mediate or immediate.

By the ſtatute of limitations, 21 Jac. I. c. 16, it is enacted, that no entry ſhall be made by any man upon lands, unleſs within twenty years after his right ſhall accrue. And by 4 & 5 Anne, c. 16, no entry ſhall be of force to ſatisfy the ſaid ſtatute of limitations, or to avoid a fine levied of lands, unleſs an action be thereupon commenced within one year after, and proſecuted with effect. This remedy by entry muſt be purſued, according to 5 Rich. II. ſt. 1. c. 8, in a peaceable and eaſy manner; and not with force or ſtrong hand. For, if one turns or keeps another out of poſſeſſion forcibly, this is an injury of both a civil and a criminal nature. The civil is remedied by immediate reſtitution, which puts the ancient poſſeſſor in *ſtatu quo*; the criminal injury or public wrong, by breach of the king's peace, is puniſhed by fine to the king. See the article FORCIBLE ENTRY.

The writ of entry is a poſſeſſory remedy which diſproves the title of the tenant or poſſeſſor, by ſhewing the unlawful means by which he entered, or continues poſſeſſion. The writ is directed to the ſheriff, requiring him to "command the tenant of the land, that he render to the demandant the land in queſtion, which he claims to be his right and inheritance; and into which, as he ſaith, the ſaid tenant had not entry, but by (or after) a diſſeiſin, intruſion, or the like, made to the ſaid demandant, within the time limited by law for ſuch actions; or that upon refuſal he do appear in court on ſuch a day, to ſhew wherefore he hath not done it." This is the original proceſs, the præcipe, upon which all the reſt of the ſuit is grounded; wherein it appears, that the tenant is required, either to deliver ſeiſin of the lands, or to ſhew cauſe why he will not. This cauſe may be either a denial of the fact, of having entered by or under ſuch means as are ſuggeſted, or a juſtification of his entry, by reaſon of title in himſelf, or in thoſe under whom he makes claim; whereupon the poſſeſſion of the land is awarded to him who produces the cleareſt right to poſſeſs it.

The writs of entry are of divers kinds, diſtinguiſhed into four degrees, according to which the writs are varied. The firſt degree is a writ of entry *ſur diſſeiſin*, that lieth for the diſſeiſee againſt a diſſeiſor, upon a diſſeiſin done by himſelf; and this is called a writ of entry in the nature of an aſſiſe. Second, A writ of entry *ſur diſſeiſin in le per*, againſt the heir by deſcent, who is ſaid to be in the *per*, as he comes in by his anceſtor; and ſo it is if a diſſeiſor make a feoffment in fee, gift in tail, &c. the feoffee and donee are in the *per* by the diſſeiſor. Third, A writ of entry *ſur diſſeiſin in le per & cui*, where the feoffee of a diſſeiſor maketh a feoffment over to another; when the diſſeiſee ſhall have this writ of entry *ſur diſſeiſin*, &c. of the lands in which ſuch other had no right of entry, but by the feoffee of the diſſeiſor, to whom the diſſeiſor demiſed the ſame, who unjuſtly and without judgment diſſeiſed the demandant. 1 *Inſt.* 238.

Theſe three degrees thus ſtate the original wrong, and the title of the tenant, who claims under ſuch wrong. If more than two degrees (that is two alienations or deſcents) were paſt, there lay no writ of entry at the common law. For, as it was provided for the quietneſs of men's inheritances, that no one, even though he had the true right of poſſeſſion, ſhould enter upon him who had the apparent right by deſcent or otherwiſe, but he was driven to his writ of entry to gain poſſeſſion; ſo, after more than two deſcents, or two conveyances, were paſſed, the demandant, even though he had the right both of poſſeſſion and property, was not allowed this poſſeſſory action, but was driven to his writ of right; a long and final remedy, to puniſh his neglect in not ſooner putting in his claim while the degrees ſubſiſted, and for the ending of ſuits, and quieting of all controverſies. 2 *Inſt.* 153. But by the ſtatute of Marlbridge, 52 Hen. III. c. 30, it was provided, that when the number of alienations or deſcents exceeded the uſual degrees, a new writ ſhould be allowed without any mention of degrees at all. And accordingly,—Fourthly, A new writ has been framed, called a writ of entry in the *poſt*, which only alleges the injury of the wrong-doer, without deducing all the intermediate title from him to the tenant, ſtating it in this manner; that the tenant had not entry, unleſs after, or ſubſequent to, the ouſter, or injury done by the original diſpoſſeſſor; and rightly concluding, that if the original title was wrongful, all claims derived from thence muſt participate of the ſame wrong. Upon the latter of theſe writs it is (the writ of entry *ſur diſſeiſin* in the *poſt*), that the form of our common recoveries of landed eſtates is uſually grounded. See the article FINE AND RECOVERY.

This remedial inſtrument of writ of entry is applicable to all the caſes of ouſter, except that of diſcontinuance of tenant in tail, and ſome peculiar ſpecies of deforcements. Such is that of the deforcement of dower by not aſſigning any dower to the widow within the time limited by the law; for which ſhe has her remedy by writ of dower, *unde nihil habet.* But in general the writ of entry is the univerſal remedy to recover poſſeſſion, when wrongfully withheld from the owner.

Entry ad communem legem. A writ of entry which lies where the tenant for term of life, or for term of another's life,

life, or by the curteſy, &c. aliens, and dies; he in the reverſion ſhall then have this writ againſt whomſoever is in poſſeſſion of the land.

Entry ad terminum qui preteriit. A writ of entry anciently brought againſt tenant for years, who held over his term, and thereby kept out the leſſor. But an ejectment is now the common mode of proceeding; and by 4 Geo. II. c. 28, tenants for term of years, &c. holding over after demand made, are ſubject to double rent.

Entry in caſu conſimili. A writ that lies for him in reverſion by Will. II. c. 24, againſt tenant for life, or tenant by the curteſy, who aliens in fee, &c.

Entry in caſu proviſo. Where a tenant in dower aliens in fee, or for term of life, or of another's life; then he in the reverſion ſhall have this writ, provided by the ſtatute of Glouceſter, 6 Edw. I. c. 7, by which it is enacted, "that if a woman alien her dower in fee, or for life, the next heir, &c. ſhall recover by writ of entry." See the article DOWER. And the writ may be brought againſt the tenant of the freehold of the land, on ſuch alienation, during the life of the tenant in dower, &c.

Entry ſine aſſenſu capituli. A writ of entry that lay where a biſhop, abbot, &c. aliened lands or tenements of the church, without the aſſent of the chapter or convent.

EN'TRY ISLAND, one of the Magdalen iſlands, in the Gulf of St. Lawrence. Lat. 46. 18. N. lon. 61. 20. W. Greenwich.

EN'TWINE. See INTWINE.

ENT'ZERSTORFF, a town of Germany, in the archduchy of Auſtria: ſix miles ſouth of Laab.

ENT'ZERSTORFF, a town of Germany, in the archduchy of Auſtria, near the conflux of the rivers Reſtinpach and Reiſenpach: ten miles weſt-north-weſt of Bruck.

ENT'ZERSTORFF IN LANGENTHAL, a town of Germany, in the archduchy of Auſtria: two miles ſouth-eaſt of Corn Neuburg.

ENT'ZERSTORFF, or STATL ENTZERSTORFF, a town of Germany, in the archduchy of Auſtria, on the north ſide of the Danube, with a caſtle ſurrounded with towers and ditches, belonging to the biſhop of Freyſingen: twenty-four miles weſt of Preſburg, and nine eaſt of Vienna.

To ENU'BILATE, *v. a.* [*e* and *nubile*, Lat.] To clear from clouds.

To ENU'CLEATE, *v. a.* [*enucleo*, Lat.] To ſolve; to clear; to diſentangle.

ENUCLEA'TION, *ſ.* A taking out the kernel; opening or explaining a difficult matter.

ENUDA'TION, *ſ.* [*e*, from, and *nudus*, Lat. naked.] The act of making naked; the act of laying open. *Scott.*

To ENVE'LOP, *v. a.* [*enveloper*, Fr.] To inwrap; to cover; to inveſt with ſome integument. To cover; to hide; to ſurround.—It is but to approach nearer, and that miſt that *enveloped* them will remove. *Locke.*

A cloud of ſmoke *envelops* either hoſt,
And all at once the combatants are loſt:
Darkling they join adverſe, and ſhock unſeen,
Courſes with courſers juſting, men with men. *Dryden.*

To line; to cover on the inſide.

His iron coat, all overgrown with ruſt,
Was underneath *enveloped* with gold,
Darkened with filthy duſt. *Spenſer.*

ENVELO'PE, *ſ.* [Fr.] A wrapper; an outward caſe; an integument; a cover:

Send theſe to paper-ſparing Pope;
And, when he ſits to write,
No letter with an *envelope*
Could give him more delight. *Swift.*

To ENVE'NOM, *v. a.* To tinge with poiſon; to poiſon; to impregnate with venom. It is never uſed of the perſon to whom poiſon is given, but of the draught, meat, or inſtrument, by which it is conveyed:

The treacherous inſtrument is in thy hand,
Unbated and *envenom'd*. *Shakeſpeare.*

Nor with *envenom'd* tongue to blaſt the fame
Of harmleſs men. *Philips.*

To make odious:

Oh, what a world is this, when what is comely
Envenoms him that bears it! *Shakeſpeare.*

To enrage; to exaſperate:

With her full force ſhe threw the pois'nous dart,
And fix'd it deep within Amata's heart;
That thus *envenom'd* ſhe might kindle rage,
And ſacrifice to ſtrife her houſe and huſband's age. *Dryd.*

To ENVER'MEIL, *v. a.* [from *vermeil*, Fr.] To colour as with vermillion:

That lovely dye
That did thy cheek *envermeil*. *Milton.*

EN'VERMEU, or ENVERMEUIL, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Dieppe: eight miles eaſt of Dieppe.

EN'VIABLE, *adj.* Deſerving envy; ſuch as may excite envy.—They, in an *enviable* mediocrity of fortune, do happily poſſeſs themſelves. *Carew.*

EN'VIER, *ſ.* One that envies another; a maligner; one that deſires the downfal of another.—Men had need beware how they be too perfect in compliments; for that *enviers* will give them that attribute, to the diſadvantage of their virtues. *Bacon.*

They ween'd
To win the mount of God, and on his throne
To ſet the *envier* of his ſtate, the proud
Aſpirer; but their thoughts prov'd fond and vain. *Milt.*

EN'VIOUS, *adj.* Infected with envy; pained by the excellence or happineſs of another.—A man of the moſt *envious* diſpoſition that ever infected the air with his breath; whoſe eyes could not look right upon any happy man, nor ears bear the burden of any man's praiſe. *Sidney.*

Still in thy right hand carry gentle peace,
To ſilence *envious* tongues. *Shakeſpeare.*

Sometimes with *againſt*.—Be not thou *envious againſt* evi men. *Prov.* xxiv. 19.—Sometimes with *at*.—Neither be thou *envious at* the wicked. *Prov.* xxiv. 19.—Commonly with *of*:

Sure you miſtake the precept, or the tree;
Heav'n cannot *envious of* his bleſſings be. *Dryden.*

EN'VIOUSLY, *adv.* With envy; with malignity; with ill-will, excited by another's good.—Damned ſpirits, being fallen from heaven, endeavour *enviouſly* to obſtruct the ways that may lead us thither. *Duppa.*

To ENVI'RON, *v. a.* [*environner*, Fr.] To ſurround; to encompaſs; to encircle.—God hath ſcattered ſeveral degrees of pleaſure and pain in all the things that *environ* and affect us, and blended them together in almoſt all our thoughts. *Locke.*

I ſtand as one upon a rock,
Environ'd with a wildernes of ſea. *Shakeſpeare.*

To involve; to envelope:

Since ſhe muſt go, and I muſt mourn, come, night,
Environ me with darkneſs whilſt I write. *Donne.*

To ſurround in a hoſtile manner; to beſiege; to hem in:

Methought a legion of foul fiends
Environ'd me, and howled in mine ears. *Shakeſpeare.*

To incloſe; to inveſt:

The ſoldier, that man of iron,
Whom ribs of horror all *environ*. *Cleaveland.*

EN'VIRONS, *ſ.* [Fr.] The neighbourhood, or neighbouring places round about the country.

EN'ULA, *ſ.* in botany. See INULA.

ENU'LUM, *ſ.* [from ἐν, within, and ὄλον, Gr. the gums.] The fleſh within the mouth. The internal gum.

To

To ENU'MERATE, *v. a.* [*enumero*, Lat.] To reckon up ſingly; to count over diſtinctly; to number.—You muſt not only acknowledge to God that you are a ſinner, but muſt particularly *enumerate* the kinds of ſin whereof you know yourſelf guilty. *Wake's Preparation for Death.*

ENUMERA'TION, *ſ.* [*enumeratio*, Lat.] The act of numbering or counting over; number told out.—Whoſoever reads St. Paul's *enumeration* of duties, muſt conclude, that well nigh the buſineſs of Chriſtianity is laid on charity. *Spratt.*

To ENUN'CIATE, *v. a.* [*enuncio*, Lat.] To declare; to proclaim; to relate; to expreſs.

ENUNCIA'TION, *ſ.* [*enunciatio*, Lat.] Declaration; public atteſtation; open proclamation.—Preaching is to ſtrangers and infants in Chriſt, to produce faith; but this ſacramental *enunciation* is the declaration and confeſſion of it. *Taylor.*—Intelligence; information.—It remembers and retains ſuch things as were never at all in the ſenſe; as the conceptions, *enunciations*, and actions, of the intellect and will. *Hale.*—Expreſſion; manner of utterance.—Without a graceful and pleaſing *enunciation*, all your elegancy of ſtyle in ſpeaking is not worth one farthing. *Cheſterfield.*

ENUN'CIATIVE, *adj.* Declarative; expreſſive.—This preſumption only proceeds in reſpect of the diſpoſitive words, and not in regard of the *enunciative* terms thereof. *Ayliffe.*

ENUN'CIATIVELY, *adv.* Declaratively.

EN'VOY, *ſ.* [*envoye*, Fr.] A public miniſter ſent from one power to another.—Perſeus ſent *envoys* to Carthage, to kindle their hatred againſt the Romans. *Arbuthnot.*—A public meſſenger, in dignity below an ambaſſador. A meſſenger:

The watchful ſentinels at every gate,
At ev'ry paſſage to the ſenſes wait;
Still travel to and fro the nervous way,
And their impreſſions to the brain convey;
Where their report the vital *envoys* make,
And with new orders are commanded back. *Blackmore.*

To ENU'RE, *v. a.* [*en* and *ure*, Lat.] To put in practice; to promote habitually:

The wanton boy was ſhortly well recured
Of this his malady;
But he ſoon after freſh again *enured*
His former cruelty. *Spenſer's Sonnets.*

Ne certes can that friendſhip long endure,
However gay and goodly be the ſtyle,
That doth ill cauſe or evill end *enure*. *Fairy Queen.*

In law it ſignifies to take place, or be available; as for example: a releaſe made to tenant for life, ſhall *enure*, and be of force and effect to him in the reverſion. *Lit.*

ENURE'SIS, *ſ.* [from εν, and ερεω, to excrete the urine.] The malady called an involuntary diſcharge of urine.

To EN'VY, *v. a.* [*envier*, Fr. *invidere*, Lat.] To hate another for excellence, happineſs, or ſucceſs.—*Envy* thou not the oppreſſor, and chuſe none of his ways. *Prov.* iii. 31.—A woman does not *envy* a man for fighting courage, nor a man a woman for her beauty. *Collier.*—To grieve at any qualities of excellence in another.—You cannot *envy* your neighbour's wiſdom, if he gives you good counſel; nor his riches, if he ſupplies you in your wants; nor his greatneſs, if he employs it to your protection. *Swift.*—To grudge; to impart unwillingly; to withhold maliciouſly.—Jonſon, who, by ſtudying Horace, had been acquainted with the rules, ſeemed to *envy* others that knowledge. *Dryden.*—[According to *Spenſer*, who, for rhime's ſake, lays the accent on the laſt ſyllable,] To emulate:

Let later age that noble uſe *envy*,
Vyle rancor to avoid and cruel ſurquedry. *Fairy Queen.*

To EN'VY, *v. n.* To feel envy; to feel pain at the ſight of excellence or felicity: with *at*.—Who would *envy at* the proſperity of the wicked, and the ſucceſs of perſecutors? *Taylor.*—To ſhew ill will:

For that he has from time to time
Envied againſt the people. *Shakeſpeare.*

EN'VY, *ſ.* Pain felt and malignity conceived at the ſight of excellence or happineſs.—*Envy* is a repining at the proſperity or good of another; or anger and diſpleaſure at any good of another which we want, or any advantage another hath above us. *Ray.*

Envy, to which th' ignoble mind's a ſlave,
Is emulation in the learn'd or brave. *Pope.*

It is uſed ſometimes with *of*:

All the conſpirators, ſave only he,
Did that they did in *envy of* great Cæſar. *Shakeſpeare.*

Sometimes with *to*.—Many ſuffered death merely in *envy to* their virtuous and ſuperior genius. *Swift.*—Rivalry; competition.—You may ſee the parliament of women, the little *envies* of them one to another. *Dryden.*—Malice; malignity:

Madam, this is a meer diſtraction;
You turn the good we offer into *envy*. *Shakeſpeare.*

Public odium; ill repute; invidiouſneſs.—Edward Plantagenet ſhould be ſhewed unto the people; to diſcharge the king of the *envy* of that opinion and bruit, how he had been put to death privily. *Bacon.*

"Better ENVIED than pitied."—The French ſay, *Il vaut mieux faire envie que pitié.*—The Italians, *Piu toſto invidia che compaſſione.*—The Greeks, Φθονεϑαι χρηϛον εϛιν η οικτειρεϑαι.—The Latins, *Malo invidiam quam miſericordiam.* This proverb is intended to inculcate, that it is better to be in thoſe circumſtances of life which may raiſe envy, than to be the objects of mere compaſſion. The conſideration of which ought to prove a conſtant admonition to employ our utmoſt diligence, and all lawful means, to attain at leaſt to ſuch a condition of life as may exempt us from pity.

ENWAL'LOWED, *part. adj.* Wallowing.—*Enwallow'd* in his own blacke bloody gore. *Spenſer.*

To ENWHEE'L, *v. a.* To encompaſs; to encircle. A word probably peculiar to Shakeſpeare:

Hail to thee, lady! and the grace of heav'n,
Before, behind thee, and on ev'ry hand
Enwheel thee round. *Othello.*

To ENWO'MB, *v. a.* To make pregnant:

Me then he left *enwombed* of this child,
This luckleſs child, whom thus ye ſee with blood. *Spenſ.*

To bury; to hide as in a womb:

Or as the Afric's Niger ſtream *enwombs*
Itſelf into the earth, and after comes,
Having firſt made a natural bridge to paſs,
For many leagues, far greater than it was;
May't not be ſaid, that her grave ſhall reſtore
Her greater, purer, finer, than before? *Donne.*

ENYS'TRUM, *ſ.* [from ενυω, to perfect.] The laſt ſtomach in animals which chew the cud; ſo called becauſe it completes the digeſtion.

ENZ, a river of Germany, which riſes about ten miles weſt of Altenſtadt, in the circle of Swabia, paſſes by Wildbad, Neuenburg, Pforzheim, &c. and joins the Neckar at Beſſigheim, in the duchy of Wurtemberg.

EN'ZIG, a lake of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg: twelve miles weſt-ſouth-weſt of Dramberg.

EN'ZINAS (Francis), called alſo DRYANDER, born at Burgos in Spain, about the year 1515. He had a brother, named John, who reſided at Rome, while it appears that Francis had reſorted to Germany for the ſake of purſuing his ſtudies. They had both become converts to the proteſtant religion; and *John* was on the point of ſetting out for

or Germany to join his brother, when ſome expreſſions which he had dropped relative to the corruptions and diſorders of the church, occaſioned his being accuſed of hereſy, and thrown into priſon. Being brought before the pope and cardinals to be examined, he had the boldneſs openly to avow his opinions; and, refuſing to retract, was condemned to the ſtake, and burnt at Rome, in 1545. *Francis* became a diſciple of Melancthon, who entertained a high opinion of his character and abilities. He was the author of a Spaniſh tranſlation of the New Teſtament, printed at Antwerp in 1543, and dedicated to the emperor Charles V. He was alſo the author of a Hiſtory of the State of the Low-countries, and of the Religion of Spain, 8vo. now very ſcarce, and forms a part of the Proteſtant Martyrology, printed in Germany.

ENZO'WAN, a town of Bohemia, in the circle of Leitmeritz: four miles eaſt of Leitmeritz.

E'O, or MIRANDA, a river of Spain, which riſes in the mountains of Aſturias, ſeparates the province of Aſturias from Galicia, and runs into the Atlantic, a little to the north of Rivadeo.

E'O-TABLE, *ſ.* a very ingenious machine, conſtructed for the purpoſe of gaming. It is of a circular form, ſcooped or hollowed down into a regular concavity, on the exterior border of which is an arrangement of notches cut eſcollop-faſhion to receive a marble, and marked alternately with the letters E and O. In one part of the circle is a receſs or notch without any mark or letter. Oppoſite to this ſits the table-keeper, who conducts the game. As many perſons can play as there are letters E and O marked upon the circle, the number of which depends on the greater or ſmaller ſize of its circumference. Thoſe who play put down their money, half-crowns, half-guineas, guineas, or what pieces, and as many of each, as they chooſe to ſtake, upon either or both the letters, which the table-keeper covers with pieces of the ſame number and value, and then throws the marble, which runs round a circular plane, till it finally ſubſides into one of the notches. If the notch be marked with E, all thoſe who laid on that letter win, and all who laid on O, loſe; and ſo *vice verſa*. By the rules of the game, the table-keeper is allowed to have one chance more than his adverſaries; and as he is at the expence of the table, and plays ſingly againſt as many perſons as the letters on the table will admit of, he ſeems fairly entitled to ſuch ſupernumerary chance; and therefore, as often as the marble falls into the *blank* receſs, he ſweeps all the money from both letters. Hence the game, upon a ſuperficial view, appears fair, and nearly equal. But as chicanery finds its way into every ſpecies of gaming, ſo it happens in this. We are informed, that by the help of an inviſible ſpring placed under the plane on which the marble runs, and moveable by a minute braſs pin known only to the table-keeper, a certain bias is communicated to the marble, ſo as to make it fall into the blank receſs at pleaſure, whereby every player is in one moment defrauded of his money. Theſe tables are much uſed at races, to decoy the unwary; but they are liable to be ſeized and burnt by the magiſtrates, and the owners of them committed to the houſe of correction.—See the article GAMING.

EOBA'NUS (Helius), ſurnamed *Heſſus*, an eminent Latin poet, born in 1488, on the confines of Heſſe, as is ſaid, under a tree; whence his parentage is concluded to have been very obſcure. His proper name was *Elias Bokkendorff*: the Chriſtian name he græciſed, with an alluſion to his being born on a Sunday. He was firſt taught to read by a monk; and, after learning Latin at a neighbouring ſchool, purſued his maturer ſtudies at the univerſity of Erfurt. The biſhop of Riſenburg in Pruſſia, who wiſhed to make him his ſecretary, ſent him for the ſtudy of the civil law to Leipſic; but his paſſion for polite literature cauſed him to quit this place in diſguſt, and ſelling his books, he returned to Erfurt. There he employed himſelf in teaching the belles-lettres, till, in 1526, Philip Melancthon procured him an invitation from the city of Nuremberg. He taught there for ſeven years; and his reputation was ſo high, that, it is ſaid, he had fifteen hundred auditors at a time. Philip landgrave of Heſſe placed him in the univerſity of Marpurg, where he died in 1540. He poſſeſſed a wonderful facility in Latin poetry, whence he has been called the German Ovid, and ſometimes the Chriſtian Ovid, which laſt title he particularly acquired from his *Heroidum Chriſtianorum Epiſtolæ*, in imitation of the Roman poet's heroic epiſtles. He compoſed a great variety of other Latin poems, of which his Elegies have been judged to be the beſt. He likewiſe gained credit by his metrical verſions of ſome of the Greek poets. Among theſe are tranſlations of Homer's Iliad, the Idylls of Theocritus, and the Rape of Helen by Coluthus. His poems have been frequently publiſhed, both ſeparately and collectively. A collection of his epiſtles has alſo been publiſhed, with his life prefixed, by Joachim Camerarius.

EODOR'BRICE, *ſ.* [from eobeŋ, Sax. a hedge, and bpice, *ruptura*.] Hedge-breaking; in which ſenſe it is mentioned in the laws of king Alfred, c. 45.

EO'LIPILE. See ÆOLIPILE, vol. i. p. 139.

E'ON, *ſ.* [from ναν, Gr. a bank.] The whole compaſs of the eye, which is ſurrounded by the eye-lids as by a bank.

E'ON (de l'Etoile), a French fanatic in the twelfth century, who for a time excited much attention, and drew after him numerous followers. He was a native of Lower Bretagne, and a gentleman by birth. His brain, however, was undoubtedly diſordered; for, having heard theſe words in the form of exorciſm, *per Eum qui venturus eſt judicare vivos et mortuos*, from the reſemblance in ſound between the Latin word *Eum* and his own name, he perſuaded himſelf that he was the perſon who was to come to judge the quick and the dead, and of courſe the Meſſiah. This extravagant opinion he preached in various towns and provinces of France, and notwithſtanding its abſurdity and wildneſs, ſucceeded in gaining a vaſt crowd of adherents, who believed him to be the arbiter of their everlaſting deſtiny. He ought to have been conſidered as an unfortunate and crazy enthuſiaſt, and recommended to the care of his friends, and the advice of phyſicians; but the church raiſed againſt him the cry of impiety and hereſy. He was committed to priſon by order of the archbiſhop of Rheims, who, in 1148, brought him to be examined before the council aſſembled in that city, at which pope Eugenius preſided in perſon. The anſwers which Eon made to the queſtions put to him by the pope, afforded evident proof of the derangement of his mind, and ſhould have recommended him to merciful treatment; but being committed to a cloſe priſon, he in a few days died miſerably. The deluded followers of Eon were arreſted and brought before the ſame council, where the option was propoſed to them either of abjuring their maſter's opinions, or of being committed to the flames. But no menaces could induce them to abandon his cauſe; and the council, ſtrangers to the genuine ſpirit of religion, and accuſtomed to perſecute for ſuppoſed errors in judgment, delivered them over to the ſecular arm, by which they were inhumanly burnt in the neighbourhood of Rheims.

E'ON, in mythology. See ÆON.

EO'OA. See EADOWE.

EO'RIA, *ſ.* in mythology, a feaſt celebrated by the Athenians in honour of Erigonus, who by way of puniſhment for their not avenging the death of his father Icarus, engaged the gods to inflict the curſe on their daughters, that they ſhould love men who never returned their paſſion. The feaſt was inſtituted by the order of Apollo.

E'OS, the name of Aurora among the Greeks; whence the epithet *Eous* is applied to all the eaſtern parts of the world. *Ovid.*

EOS'TRE, in mythology, a Saxon goddeſs, to whom ſacrifices were offered in the month of April, called the month of *Eoſtra*; and thence the name *Eaſter*, which the Saxons retained after their converſion to Chriſtianity, ap-

plying it to the feſtival celebrated in commemoration of our Saviour's reſurrection. See EASTER.

EPAC'ME, *ſ.* [from επαχμαζω, Gr. to increaſe.] The increaſe or exacerbation of a diſeaſe.

EP'ACRIS, *ſ.* [from επι, and ακρις, Gr. the ſummit of a mountain; theſe plants growing in that ſituation. *Forſter.*] In botany, a genus of the claſs pentandria, order monogynia, natural order of ericæ, *(Juſſ.)* The generic characters are—Calyx: perianthium five-parted, equal, permanent; diviſions lanceolate. Corolla: one-petalled, funnel-form; tube gradually widening into a five-cleft border; diviſions ovate, acute, villoſe above; nectary five obovate emarginate ſcales, faſtened to the germ, and preſſed cloſe. Stamina: filaments five, very ſhort, in the throat of the corolla; antheræ incumbent. Piſtillum: germ roundiſh, five-ſtreaked; ſtyle cylindric, ſhort; ſtigma capitate. Pericarpium: capſule globular-flatted, five-celled, five-valved, gaping. Seeds: numerous, very ſmall.—*Eſſential Character.* Corolla funnel-form, villoſe; nectary ſcales faſtened to the germ; capſule five-celled, five-valved.

Species. 1. Epacris longifolia, or long-leaved epacris: arboreous; leaves ſubulate, ſheathing; racemes upright; flowers oppoſite. 2. Epacris juniperina, or juniper epacris: arboreous; leaves ſcattered, linear, acute, ſpreading, ſeſſile; racemes drooping; flowers alternate. 3. Epacris pumila, or dwarf epacris: herbaceous; leaves ovate-oblong, imbricate; flowers ſeſſile, ſubſolitary. 4. Epacris roſmarinifolia, or roſemary-leaved epacris: ſhrubby; leaves linear, obtuſe, rigid, ſheathing; flowers ſolitary, lateral. Theſe are all natives of New Zealand. The fruit of the firſt and ſecond ſpecies is particularly deſcribed by Gærtner. The ſecond is conſidered as comprehending two ſpecies by Forſter.

E'PACT, *ſ.* [επακτη, Gr.] A number, whereby we note the exceſs of the common ſolar year above the lunar, and thereby find out the age of the moon. See the article CHRONOLOGY, vol. iv. p. 536, 537.

EPAGO'GIUM, *ſ.* [from επαγω, Gr. to draw over.] The prepuce, or that part of the penis which is drawn over the glans.

EPAI'GNE, a town of France, in the department of the Eure: five miles ſouth Pont-Audemer.

EPAINE'TIC, *adj.* [from επαινος, Gr. praiſe.] Praiſing; tending to praiſe. *Scott.*

EPAMINON'DAS, a famous Theban, deſcended from the ancient kings of Bœotia. His father's name was Polymnus. He has been celebrated for his private virtues and military accompliſhments. His love of truth was ſo great, that he never diſgraced himſelf by falſehood. He formed a moſt ſacred and inviolable friendſhip with Pelopidas, whoſe life he ſaved in a battle. By his advice Pelopidas delivered Thebes from the power of Lacedæmon. This was the ſignal of war. Epaminondas was ſet at the head of the Theban armies, and defeated the Spartans at the celebrated battle of Leuctra, about 371 years before Chriſt. Epaminondas made a proper uſe of this victorious campaign, and entered the territories of Lacedæmon with 50,000 men. Here he gained many friends and partiſans; but at his return to Thebes he was ſeized as a traitor for violating the laws of his country. While he was making the Theban arms victorious on every ſide, he neglected the law which forbad any citizen to retain in his hands the ſupreme power more than one month, and all his eminent ſervices ſeemed unable to redeem him from death. He paid implicit obedience to the laws of his country, and only begged of his judges that it might be inſcribed on his tomb that he had ſuffered death for ſaving his country from ruin. This animated reproach was felt; he was pardoned, and inveſted again with the ſovereign power. He was ſucceſsful in a war in Theſſaly, and aſſiſted the Eleans againſt the Lacedæmonians. The hoſtile armies met near Mantinea, and while Epaminondas was bravely fighting in the thickeſt of the enemy, he received a fatal wound in the breaſt, and expired exclaiming that he died unconquered, when he heard that the Bœotians obtained the victory, in the 48th of his age, 363 years before Chriſt. The Thebans ſeverely lamented his death; in him their power was extinguiſhed, for only during his life they had enjoyed freedom and independence among the Grecian ſtates. Epaminondas was frugal as well as virtuous, and he refuſed with indignation the rich preſents which were offered to him by Artaxerxes the king of Perſia. He is repreſented by his biographer as an elegant dancer and a ſkilful muſician, accompliſhments highly eſteemed among his countrymen. *Plutarch.*

EPANADIPLO'SIS, *ſ.* [Gr.] A rhetorical figure, wherein a ſentence begins and ends with the ſame words.

EPANALEP'SIS, *ſ.* [Gr.] A figure in rhetoric, in which the ſame word is, for enforcement ſake, repeated.

EPANAPH'ORA, *ſ.* [Gr.] A figure in which the ſame word begins ſeveral ſentences; as, *Ver adeo Frondi, Ver utile Sylvis.*

EPANAPNE'SIS, *ſ.* [from επι and αναπνεω, Gr. to breathe.] Shortneſs of breath: a quick reſpiration.

EPAN'ODOS, *ſ.* [Gr.] A return; a figure in rhetoric in which the ſame ſound or word is repeated twice in ſeveral ſentences.

EPANOR'THOSIS *ſ.* [Gr.] A correction, an amendment; a figure in rhetoric in which a ſentence too weakly expreſſed is ſtrengthened by the addition of one expreſſed in more forcible terms.

EPAPH'RAS, *ſ.* [Gr.] A man's name,

EPAPHÆ'RESIS, *ſ.* [from επι and αφαιρεω, Gr. to take away.] A repeated evacuation by bleeding.

EP'APHUS, a ſon of Jupiter and Io, who founded a city in Egypt, which he called Memphis, in honour of his wife, who was the daughter of the Nile. He had a daughter called Libya. He was worſhipped as a god at Memphis. *Herodotus.*

EPAPHRODI'TUS, one of the firſt biſhops or miniſters of the Chriſtian church that was founded by St. Paul at Philippi in Macedonia. He was in that ſituation when St. Paul was priſoner at Rome, and was ſent by his church to viſit the apoſtle in his bonds, and to carry him their liberal contributions towards his ſupport and maintenance. He therefore deſerves to have his name recorded with honour among the worthies who, in the early ages of Chriſtianity, when its enemies were active in their endeavours, by perſecution and every ſpecies of diſcouragement, to cruſh the riſing ſect, ſtood forward at all hazards to avow its principles, and to confirm the firſt believers, in a ſtedfaſt adherence to the doctrines and inſtructions of the apoſtles.

E'PARCH, *ſ.* [from επαρχος, Gr.] The preſident of a province.

EPAR'MA, *ſ.* [from επαιρω, Gr. to elevate.] With ſurgeons, an epithet for any kind of tumour.

EPAULET'TE, *ſ.* [Fr.] The ſhoulder-ſtrap of a boddice or ſtays; the ſhoulder-piece of a ſhirt or ſhift; a ribbon tied upon a man's ſhoulder. It is commonly uſed for the ſhoulder-knot of diſtinction in the army, worn both by the officers and private men; and is an ornamental badge now commonly placed on the ſhoulders of menſervants.

EPAUL'MENT, *ſ.* [Fr. from *epaule*, a ſhoulder.] In fortification, a ſidework made either of earth thrown up, of bags of earth, gabions, or of faſcines and earth. It ſometimes denotes a ſemi-baſtion and a ſquare orillion, or maſs of earth faced and lined with a wall, deſigned to cover the cannon of a cazemate. See the article FORTIFICATION.

EPE'E, a port of Africa, in the country of Benin.

EPEN'THESIS, *ſ.* [from επι, to, εν, and τιθημι, Gr. to place.] In grammar, the addition of a letter or ſyllable in the middle of a word, as *relligio* for *religio*, *induperator* for *imperator*.

EPE'RIES, a town of Hungary, celebrated for its

mines of ſalt. It was taken by the malcontents in 1682, and retaken by general Schultz in 1685: twenty miles north of Caſchau.

EPERLE'QUE, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the diſtrict of St. Omer: two leagues north-weſt of St. Omer.

EPERNAY', a town of France, and principal place of a diſtrict, in the department of the Marne, celebrated for its wine, and manufactures of cloth. It was taken by Henry IV. in the year 1592, when the mareſchal de Biron was killed while the king leaned on his ſhoulder: four leagues and a half ſouth of Rheims, and five and a half weſt of Châlons-ſur-Marne.

EPERNON', a town of France, in the department of the Eure and Loire, and chief place of a canton, in the diſtrict of Chartres: four leagues north-eaſt of Chartres.

EPER'VA, *ſ.* in botany. See DIMORPHA.

EPE'US, a ſon of Endymion, brother to Pæon, who reigned in a part of Peloponneſus. His ſubjects were called from him Epei. *Pauſanias.*—A ſon of Panopeus, who was the fabricator of the famous wooden horſe which proved the ruin of Troy. *Virgil.*

E'PHA, *ſ.* [אֵיפָה, Heb.] A meaſure among the Hebrews, containing dry, 3 pecks, 3 pints, 12 ſolid inches, and 4 decimal parts; and in liquid things, 4 gallons, 4 pints, and 15 ſolid inches, wine meaſure. But Taylor, in his Hebrew concordance, ſays, it contains 7 gallons, 2 quarts, and half a pint, wine meaſure.—The *epha* and the bath ſhall be of one meaſure; that the bath may contain the tenth part of an homer, and the *epha* the tenth part of an homer. *Ezekiel.*

E'PHAH, a country mentioned by the prophet Iſaiah, as famous for its dromedaries. *Iſaiah* lx. 6.

EPHEBÆ'UM, *ſ.* [from επι, and ηϐη, Gr. the groin.] The hair upon the pubes.

EPH'EBI, *ſ.* [from εφηϐια, εφηϐος, Gr. a ſtripling.] Among the Athenians, a deſignation given to their young men when they arrived at eighteen years of age, at which time they had their names entered in a public regiſter.

EPH'EDRA, *ſ.* [from εφεζομαι, Gr. to ſit upon.] The protuberant part of the buttocks upon which we ſit.

EPH'EDRA, *ſ.* [from επι, by, and ὑδωρ, Gr. water; expreſſive of the place of growth. *Linn.* According to this derivation, it ſhould be *ephydra.* The true derivation muſt be from εφεδρα, *inſeſſio.*] In botany, a genus of the claſs dioecia, order monadelphia, natural order of coniferæ. The generic characters are—I. Male. Calyx: ament compounded of one-flowered ſcales, few, roundiſh, concave, length of the perianthium; perianthium proper one-leafed, half two-cleft, roundiſh, inflated, ſmall, compreſſed; diviſions obtuſe. Corolla: none. Stamina: filaments ſeven, coaleſcing into a ſubulate pillar, divided at the tip, longer than the calyx; antheræ roundiſh, turned outwards, of which four are inferior, the other three ſuperior. II. Female. Calyx: perianthium five-fold, one placed on another, with alternate diviſions, in an ovate figure; each one-leafed, ſomewhat ovate, two-parted; the exterior ones ſmaller. Corolla: none. Piſtillum: germs two, ovate, ſize of the laſt perianthium, on which they are placed; ſtyles ſimple, filiform, ſhort; ſtigmas ſimple. Pericarpium: none; calycine ſcales all thickened, ſucculent, conſtituting a divided berry. Seeds: two, ovate-ſharp, on one ſide convex, on the other flat, compreſſed by the calyx covering them on every ſide.—*Eſſential Character.* Male. Calyx of the ament two-cleft; corolla none; ſtamina ſeven; antheræ four inferior, three ſuperior. Female. Calyx two-parted, five-fold; corolla none; piſtillum two; ſeeds two, covered with a berried calyx.

Species. 1. Ephedra diſtachya, great ſhrubby horſe-tail, or ſea-grape: peduncles oppoſite, aments in pairs. 2. Ephedra monoſtachya, or ſmall ſhrubby horſe-tail: peduncles ſeveral, aments ſolitary.

This genus is allied to Equiſetum, as well in its habit and ſheathed joints, as in its ſtaminiferous column; it is perhaps ſtill more nearly allied to gnetum, or ſalicornia. Theſe plants vary extremely. Some, in the ſouth of Europe, are only a hand in height, whilſt others are three feet high. Linnæus ſuſpected that the Siberian plant might not be ſpecifically different from this; and Pallas is decidedly of that opinion: he ſuſpects that Linnæus had received only imperfect ſpecimens from Siberia, and was led by them to make a ſecond ſpecies. Pallas thus deſcribes it: It is a ſhrub, varying wonderfully according to its ſtation, ſometimes a foot or eighteen inches high, ſometimes only a finger's height, or even lower; proſtrate or aſcending. Trunk fibrous-woody, often thicker than a finger, with ſome branches ſpreading on the ground, and others, which are ſhort and woody, riſing, and ſubdivided copiouſly into ruſh-like branchlets. Theſe are jointed, not at all ſucculent, ſufficiently tenacious, glaucous-green, a little ſubdivided, ſometimes more than a ſpan in length, and ſtraight, ſometimes curled in a ſpiral, particularly in dry ſituations. The joints do not readily ſeparate; the internodes are often an inch and half in length, very finely ſtreaked, cylindric, terminated at the top by two membranaceous, pubeſcent, emarginate, ſcales. The plants are never hermaphrodite, but frequently barren, eſpecially in a dry ſoil. The male plant is uſually taller, with the aments of the upper joints commonly in pairs, oppoſite, on a peduncle iſſuing from one of the ſcales. It is found in moſt of the ſouthern parts of the vaſt Ruſſian dominions; is common from the Volga to the Lena, and ſouthward to Perſia and India. The berries ripen in July and Auguſt; they are ſweetiſh, mucoſe, and leave a little heat in the throat: they are eaten by the Ruſſian peaſants, and by the wandering hordes of all Great Tartary; the Calmucs and other Tartars alſo uſe them medicinally, in catarrhs, rheumatiſms, &c. The European plant was cultivated here before 1570, by Matthias de l'Obel, and flowers in June and July. The Siberian was introduced about 1772, by Meſſrs. Kennedy and Lee, and flowers from September to November.

Theſe may be propagated by offſets, which the plants ſend forth in great plenty; for the roots creep under ground, and ſend forth ſuckers, which may be taken off to tranſplant in the ſpring. They love a pretty moiſt ſtrong ſoil, and will endure the cold of our ordinary winters very well in the open air. Some of theſe plants were formerly preſerved in pots, and were houſed in winter, but by later experience they are found to thrive better in the full ground.

EPHE'LIS, *ſ.* [Gr.] A ſpot or freckle which proceeds from a ſun-burn.

EPHE'MERA, *ſ.* [from ημερα, Gr. a day.] In medicine, a diary fever, or a fever of one day's continuance only. In this caſe, ſuch a heat as attends an exceſs of wine, a pulſe ſomewhat full and quick, but ſoft and regular, a ſlight head-ach, a nauſea, and reſtleſſneſs, are the ſymptoms, and which terminate without any ſenſible evacuation. If it continue unto the third day, it is not a diary fever; and if the conſtitution is very irritable, an hectic is to be apprehended.

EPHE'MERA, *ſ.* [from επι, and ημερα, a day.] The DAY-FLY; in entomology, a genus belonging to the order of neuroptera. The generic characters are: mouth without mandibles; feelers four, very ſhort, filiform; antennæ ſhort, and filiform; above the eyes are two or three ſtemmata; wings erect, the lower ones ſhorteſt; tail furniſhed ſome with two, ſome with three, briſtles. This is what the Britiſh anglers call the May-fly, from their chicfly abounding towards the middle or end of that month, falling on the waters, where the fiſh eagerly devour them; and on the river ſide, when the angler collects them. Theſe flies, who take their name from the ſhortneſs of their life, are diſtinguiſhed into twenty-one ſpecies. Some live ſeveral days, others do not take flight till the ſetting of the ſun, and live not to ſee the riſing of that luminary. Of this kind is the *Ephoron leukon,* or white fly, lately diſcovered and deſcribed by Dr. William-

ſon.

ſon. Theſe inſects are natives of the river Paſſaic, but their utmoſt range is not above two miles and a half, and within theſe limits they riſe in clouds, and without number. Their firſt appearance every year is about the 20th of July, and they continue riſing every evening, more or leſs, about three weeks. They ſeek the light, for they fly in crowds to a lamp or candle. Some exiſt but one hour, others but half that time; in which ſhort period they comply with the call of nature. With reſpect to thoſe who live ſeveral days, there is a peculiarity obſerved, incident to themſelves alone. They have to caſt off one ſlough more, an operation which ſometimes takes twenty-four hours to complete. To bring this about, they cling faſt to a tree. The ephemeræ, before they flutter in air, have in ſome meaſure been fiſhes. They remain in the ſtates of larvæ and chryſalids for one, two, or three, years. The chryſalis only differs from the larva by there being on its back caſes for wings. Both have on their ſides ſmall ſringes of hair, which, when put into motion, ſerve them as fins. Nothing can be more curious than the plying of theſe little oars in the water. Their abdomen is terminated, as well as in their fly ſtate, by two or three threads or briſtles. Theſe larvæ ſcoop themſelves out dwellings in the banks of rivers; and they are ſmall tubes made like ſiphons, the one ſerving for an entrance, the other affording them an outlet. The banks of ſome rivers are quite perforated with them. When the waters decreaſe, they dig freſh holes lower down, in order to enjoy their element, the water. The ſeaſon and hour when the chryſalids of the different ſpecies of the ephemeræ turn into flies, maintain a kind of regularity. The heat, the riſe or fall of the waters, accelerate, however, or poſtpone, their final diſplay. The ephemeræ of the Rhine appear in the air two hours before ſunſet. Theſe flies are hatched almoſt all at the ſame inſtant in ſuch numbers as to darken the air. The moſt early of thoſe on the Marne and Seine in France do not begin to fly till two hours after the ſetting of the ſun, towards the middle of Auguſt. They are ſeen fluttering and ſporting on the brink of their tomb. The glare of light attracts them, round which they perform a thouſand circles with amazing regularity. Their coming together for the purpoſe of generation can only be ſurmiſed, the ſhortneſs of their life requiring that all its functions ſhould be proportionable to their duration. Some naturaliſts have been of opinion, that the males impregnate the eggs after the manner of fiſhes. The females, by the help of the briſtles of their tail, and the flapping of their wings, ſupport themſelves on the ſurface of the water, and in that almoſt upright ſituation drop their eggs in cluſters. One ſingle female will lay ſeven or eight hundred eggs, which ſink to the bottom. The larvæ that eſcape from the voraciouſneſs of the fiſhes, ſet about the conſtruction of habitations to ſhelter them from every kind of danger. When the flies have propagated, they are ſeen to die and fall by heaps. In Carniola, the land and waters are ſtrewed with them to a conſiderable thickneſs; inſomuch that the peaſants collect them by cart-loads to manure the ground. Trout are not only remarkably fond of this fly, but of the larvæ likewiſe. The fiſhermen conſider theſe multitudes of falling inſects as manna for the fiſhes.—See figures of three ſpecies in the engraving.

EPHE'MERAL, or EPHEMERIC, *adj.* [from επι, upon, and ημερα, Gr. a day.] Diurnal; beginning and ending in a day.—This was no more than a mere bubble or blaſt, and like an *ephemeral* fit of applauſe. *Wotton.*

EPHE'MERIS, or EPHEMERIDES, *ſ.* [*effemaeride*, Ital. εφημεριδες, Gr.] Tables calculated by aſtronomers, ſhewing the preſent ſtate of the heavens for every day at noon; that is, the places in which all the planets are found at that time; differing but little from an aſtronomical almanac. It is from ſuch tables that the eclipſes, conjunctions, and aſpects, of the planets are made out; as alſo horoſcopes, or celeſtial ſchemes, conſtructed, &c. There have been ephemerides of Origan, Kepler, Argoli, Heckerus, Mezzarachis, Wing, Gadbury, Parker, De la Hire, &c. In France the academy of ſciences have publiſhed annually, from the beginning of the eighteenth century, a kind of ephemeris, under the title of *Connoiſſance des Temps*, which is ſtill continued, and is in great eſteem; as are alſo the ephemerides, publiſhed every ten years, by M. Deſplaces, and De la Lande. There are alſo publiſhed ſuch ephemerides by the academies of ſeveral other nations; but that which is in moſt eſteem for its accuracy and uſe in finding the longitude, is the Nautical Almanac, or Aſtronomical Ephemeris, publiſhed in London by the board of longitude, under the direction of the Rev. Dr. Maſkelyne, aſtronomer royal, which commenced in 1767.

EPHE'MERIST, *ſ.* One who conſults the planets; one who ſtudies or practiſes aſtrology.—The night before, he was diſcourſing of and ſlighting the art of fooliſh aſtrologers, and genethliacal *ephemeriſts*, that pry into the horoſcope of nativities. *Howel.*

EPHE'MERUM, *ſ.* in botany. See COMMELINA, ERANTHEMUM, HELONIAS, LYSIMACHIA, and TRADESCANTIA.

E'PHES-DAM'MIM, (or the coaſt of Dammim, called alſo Paſ-dammim,) in Paleſtine, in the tribe of Judah; where the Philiſtines encamped previous to the battle in the valley of Elah. 1 *Sam.* xvii. 1. 1 *Chron.* xi. 13.

EPHE'SIAN, *adj.* Belonging to Epheſus.

EPHE'SIAN, *ſ.* A native of Epheſus.

EPHES'TRIS, *ſ.* In antiquity, a garment worn over armour. *Phillips.*

EPH'ESUS, a city of Ionia, in Aſia Minor, built, as Juſtin mentions, by the Amazons; or by Androchus, ſon of Codrus, according to Strabo; or by Epheſus, fabled to be a ſon of the river Cayſter. It is famous for a temple of Diana, which was reckoned one of the ſeven wonders of the world. Mr. Dallaway, who recently viſited Epheſus, and publiſhed his account of it ſo late as 1797, deſcribes it as follows: "At a ruined bridge, on the banks of the Cayſter, the view, infinitely grand, extends from a mount crowned with a ſingle tower, and includes a ſeries of the reliques of ancient Epheſus around mount Prion, flanked by the ſerrated cliffs of mount Correſſus, the dilapidated moſque, village, and caſtle, of Aiaſolûk, ingrafted on a bold faſtneſs, and completing a proſpect of ſuperior intereſt. What it was, when Epheſus flouriſhed, the boaſt of Ionia, imagination muſt now ſupply; nor are all the features of nature ſtill the ſame. Thoſe which are unaltered are upon ſo magnificent a ſcale as ſeldom to occur independent of ſuch accompaniments, however heightened by them. The branch of the ſea which formed its port no longer exiſts, and is ill ſucceeded by a vaſt moraſs of tall reeds. The vale of Epheſus exhibits ſo total a change, that a perfect phenomenon appears to have taken place; although, in the lapſe of ſo many ages, from the ſame cauſe, the ſame effect may have been produced in many countries, the ſtate of which, at as remote a period of time, has not been tranſmitted to us.

An arm of the Ægean ſea furniſhed the city with ſeveral ports, but all were ſhallow and incommodious. Attalus Philadelphus, king of Pergamus, memorable for the magnificence of his public works, was perſuaded by an architect to conſtruct a mole, which ſhould remedy the inconvenience. They did not foreſee that by interrupting the current ſo great a miſchief would enſue; for the accretion of the earth, brought down by a river of torrents, ſoon deſtroyed the port, and the commercial advantages of the place; and in ſucceſſive ages has encroached ſome miles on the dominion of the ſea. The Cayſter now flows through ſedges, ſcarcely viſible; and whoever viſits Epheſus, without previous information, could not ſuppoſe it ever to have had a free communication with the ocean.

In the Grecian hiſtory, the firſt circumſtance recorded of Epheſus, is the ſiege by Cræſus, king of Lydia, at that time a city of the Carians, rendered ſacred by the fame of Diana. To that venerable ſtructure, the Epheſians

fians were proud to owe their ſuperiority over the Ionian cities. The rude object of their primeval worſhip was a block of beech or elm carved into the ſimilitude of Diana, not as the elegant huntreſs, but an Ægyptian hieroglyphic, which we call the goddeſs of nature, with many breaſts, and the lower parts formed into an hermæan ſtatue groteſquely ornamented and diſcovering the feet beneath it. This image was preſerved till the later ages in a ſhrine, on the embelliſhment of which mines of wealth were conſumed, and the genius of Praxiteles exhauſted.

The earlieſt temple was partially burned, and probably the roof of timber only, by Heroſtratus, a philoſopher who choſe that method to inſure to himſelf an immortal name on the very night on which Alexander was born. Twenty years after, that magnificent prince, during his grand expedition for the conqueſt of Perſia, offered to appropriate his ſpoils to the reſtoration of it, if the Epheſians would conſent to allow him the ſole honour; but they rejected the propoſal as diſgraceful for them to accept; and ſo general was the devotion, that the women worked at its materials, and 220 years were ſpent in its completion. The deſigner and original architect was Cteſiphon, a Cnoſſian, aſſiſted by his ſon Metagenes, 541 years before the Chriſtian era; and their plan was continued by Demetrius, a prieſt of Diana; but the whole was completed by Daphnis of Miletus, and a citizen of Epheſus. It was the firſt ſpecimen of the Ionic ſtyle, and in which the fluted column and capital with volutes were originally introduced. Leſt ſo great a ſtructure ſhould be endangered by earthquakes, they ſelected a marſhy ſite for the foundations, which were laid on charred piles and beds of wool. The whole length of the temple was 425 feet, and the breadth 220; with 127 columns of the Ionic order, and Parian marble each of a ſingle ſhaft, and ſixty feet high. It had a double row of columns, fifteen on either ſide; and Vitruvius has not determined if it had a roof; probably, over the cell only. Such dimenſions excite ideas of uncommon grandeur from mere maſſiveneſs; but the notices we collect of its internal ornament will increaſe our admiration. It was the repoſitory in which the great artiſts of antiquity dedicated their moſt perfect works to poſterity. Praxiteles and his ſon Cephiſodorus adorned the ſhrine; Scopas contributed a ſtatue of Hecate; Timarete the daughter of Mycon, the firſt female artiſt upon record, finiſhed a picture of the goddeſs, the moſt ancient in Epheſus; and Parrhaſius and Apelles, both Epheſians, employed their ſkill to embelliſh the pannels of the walls. The excellence of theſe performances may be ſuppoſed to have been proportioned to their price, and a picture of Alexander graſping a thunder-bolt by the latter, was added to this ſuperb collection, at the expence of twenty talents of gold, a ſum, according to certain commentators on Pliny, ſo exorbitant, as ſcarcely to be reconciled to an equivalent value in our money. From theſe imperfect documents we may conjecture what was the ſtate of painting in the flouriſhing ages of Greece, whilſt the admiration of the Italian ſchools may induce a regret, that the opportunity of forming a compariſon is loſt for ever. So great an inferiority exiſts between the deſign and execution of the Freſco paintings in the moſt perfect ſtate diſcovered at Herculaneum and Portici, that it may be preſumed, that many of them were copied from the more famous works of Grecian artiſts at that time imported into Italy.

The prieſts of Diana ſuffered emaſculation, and virgins were devoted to inviolable chaſtity. They were eligible only from the ſuperior ranks, and enjoyed a great revenue with privileges, the eventual abuſe of which induced Auguſtus to reſtrain them. Amongſt others was that of an aſylum for inſolvent debtors. For ſeveral centuries after the poſſeſſion of the Roman emperors, and ſeven ſucceſſive injuries from which it ſuffered almoſt a demolition, the temple retained an undiminiſhed ſplendour; and was finally burnt by the Goths in their third naval invaſion, when the remaining beauty of the Aſiatic cities was totally defaced, and of thoſe in the region of the Troad ſcarcely a veſtige can be diſcovered. The Epheſian games, originally inſtituted by the Ionians in honour of Diana, were frequented as late as the reign of Caracalla. They bore the title of Neocori, in conſequence of having temples and ceremonies dedicated to Claudius and Hadrian.

In the year 409 before Chriſt, the Epheſians ſignalized themſelves by a total defeat of the Athenians under Thraſyllus; and during the Perſian war in 395 B. C. Ageſilaus eſtabliſhed himſelf in their city. The Roman ſenate appointed Attalus king of Pergamus, and his ſucceſſors, guardians of the Aſiatic ſtates; and under the imperial government Epheſus continued to increaſe in opulence and ſplendour; though, of the thirteen cities almoſt deſtroyed by the earthquake in the reign of Tiberius, it did not eſcape without a conſiderable ſhare of the calamity.

Timothy, the colleague of St. Paul, was the firſt biſhop of Epheſus, and eſtabliſhed the Chriſtian faith; and under the auſpices of Conſtantine and Theodoſius new churches were erected and the pagan temples deſpoiled of their ornaments, or accommodated to other worſhip. The edict of the latter emperor, the object of which was the ſubverſion of thoſe magnificent piles which had been conſecrated to the heathen deities, was executed with the moſt laborious deſtruction; and the ruin of the faireſt ſtructures of antiquity originated in the zeal of the early Chriſtians. The immenſe dome of Santa Sophia at Conſtantinople, now riſes from the columns of green jaſper which were originally placed in the temple of Diana at Epheſus, and were taken down by order of Juſtinian. *Procopius de ædificiis Juſtiniani* aſcertains their identity. Two pillars now in the great church at Piſa were likewiſe tranſported from thence. The antiquary is frequently pleaſed to be able to trace theſe ſtupendous ornaments through their whole hiſtory, as compoſing in ſucceſſive ages, the grandeur of temples ſacred to Paganiſm, to Chriſtianity, and the Mahomedan faith.

Circumſtances, not abſolutely to be attributed to any ſingle cauſe, but to thoſe periods of growth and decay which await cities as well as men, involved Epheſus in univerſal depopulation, even before the Greek empire was extinct. The Carian princes founded their citadel and town, about two miles diſtant, at Aiaſoluk; and removed all the materials for that purpoſe, ſo that upon their poſſeſſion of the Aſiatic provinces it was totally deſerted, and the ſite remains to be diſtinguiſhed by numerous and confuſed heaps of disjointed architecture. Among theſe we may notice the range of vaults, once communicating with the harbour as warehouſe, and forming one ſide of an ample ſtreet; above which is the ſtadium, partly raiſed on vaults to render it level with the ſlope of the hill; a high wall at the circular end is perfect, and conſtructed with heavy rough ſtones. The gate of the left wing is of white marble, and nearly entire; but evidently made up of fragments in a latter age. Ignorant of this circumſtance, Tournefort is puzzled with a mutilated inſcription, which is legible. There are others of Greek, but too far diſtant to be tranſcribed. The blocks of marble are ſeveral tons weight. The pavement of a broad ſtreet then interveñes between another eminence of greater height, upon the brow of which, and occupying the whole platform, are the foundations of a ſumptuous arcade, as appears from the baſes of ſeveral columns, traced to a great extent. This has been a ſpacious temple, hitherto unnoticed. Winding round the hill, is the theatre which Pococke conſiders as the inferior of two, if it were not a Naumachia; it has two vaſt gateways, and a regular baſin ſcooped from the marble rock, with the ſubſellia removed. Beyond is a groupe of broken pillars and heaps of architectural fragments near the temple voted to Claudius by the Aſiatic cities, which had a portico of the Corinthian order, raiſed on four columns only, each thirty feet in length, the moſt intire ſhaft of which meaſures more than four feet in diameter, and one broken in two pieces is of more than half its proportions. The point of

the tympanum, with a very rich cornice, conſiſted of blocks ſeveral tons weight, with capitals of carved acanthus, all of white marble, ſupplied by the contiguous quarries of mount Prion. The fronting area of an acre at leaſt was incloſed by a periſtyle of black granite, of which are innumerable veſtiges. It was probably the agora or forum. Farther on, and cloſe upon the brink of the preſent moraſs once covered by the ſea, upon a riſing ground, are accumulated walls of brick faced with large ſlabs of marble, and of ſufficient extent to encourage Tournefort and the Engliſh travellers in a conjecture that this ſtructure was the famed temple of Diana. One common demolition has now, however, overwhelmed the parent city and its temporary rival; and the lapſe of many intermediate ages is not diſcernible from any ſeries of more complete ſtructures.

On the eaſt ſide of mount Prion, there is a cavern as extenſive as ſome of thoſe in Derbyſhire, but not ſo deep; the length is a hundred yards, and the height about as many feet, both apertures being nearly equal. Of theſe there are many curious traditions. In the reign of Julian, a noted ſophiſt named Maximus occupied one of them for the celebration of midnight orgies and the Eleuſinian myſteries, when that emperor was initiated, his inſolent apoſtacy openly profeſſed, and he became, as he wiſhed the world to believe, a follower of Plato.

The legendary miracle of the ſeven ſleepers, who were ſaid to have been immured in one of theſe grottos in the reign of the perſecuting Decius, and to have awakened nearly two centuries after in that of the bigot Theodoſius, has afforded matter for the homilies of the fathers of the Greek church, and the Koran. When the popularity of this ſtory was ſpread through many languages and nations, Mohammed had patiently liſtened to the narrative camel driver, who related it amongſt other tales for the ſolace or the caravan. He then, perhaps, little ſuſpected that he ſhould ever become the leader of millions, and that ſuch a fable would be of conſequence enough to be admitted into the volume which engroſſes the faith of his followers. But ſuch was its acceptation amongſt thoſe whom he determined to conquer or conciliate; and the uſe he as made of it, with the latitude it offered, is no proof of his original genius. Mohammed entitles the eighteenth chapter of the Koran, "the Chapter of the Cave," in which he directs his followers how they are to believe this celebrated miracle. "The infidels ſay they were five, and that their dog was the ſixth: they ſpeak by opinion; but the true believers affirm them to be ſeven, and their dog to be the eighth." Upon a gold coin of the Turks called armoodi, the names of ſeven ſleepers are thus written, "Jemlikà, Meſhelina, Miſlina, Mernoos, Debernoos, Shazenous, and Kepheſtatjoos."

At the foot of mount Prion, under the ſingle tower known by tradition as the priſon of St. Paul, are the veſtiges of many ſumptuous buildings, which muſt have added ſuperior grandeur to the Ionian metropolis. We are told that the tombs of St. John and Timothy were both in that ſpot, decorated with ſtately ſtructures. Farther from the town are many ſmall vaults, originally ſerving as catacombs for families of ſuperior rank.

In the time of the apoſtle Paul, Epheſus retained a great deal of its ancient grandeur. See Acts xviii. 19, &c. Towards the end of the 11th century, a Turkiſh pirate, named *Tangripermes*, ſettled there. But the Greek admiral, John Ducas, defeated him in a bloody battle, and purſued the flying Turks up the Mæander. In 1306, it was among the places which ſuffered from the exactions of the grand-duke Roger; and two years after, it ſurrendered to ſultan Sayſan, who, to prevent future inſurrections, removed moſt of the inhabitants to Tyriæum, where they were maſſacred. Epheſus appears to have ſubſiſted as an inconſiderable place for many centuries. Now the Epheſians are only a few Greek peaſants, living in extreme wretchedneſs, dependence, and inſenſibility; the repreſentative of an illuſtrious people, and inhabiting the wreck of their greatneſs; ſome, the ſubſtructions of the glorious edifices which they raiſed; ſome, beneath the vaults of the Stadium, once the crowded ſcene of their diverſions; and ſome, by the abrupt precipice, in the ſepulchres which received their aſhes.

EPHE'TÆ, a number of magiſtrates at Athens firſt inſtituted by Demophoon, the ſon of Theſeus. They were reduced to the number of fifty-one by Draco, who, according to ſome, firſt eſtabliſhed them. They were ſuperior to the Areopagates, and their privileges were great and numerous. Solon, however, leſſened their power, and entruſted them only with the trial of manſlaughter and conſpiracy againſt the life of a citizen. They were all more than fifty years old, and it was required that their manners ſhould be pure and innocent, and their behaviour auſtere and full of gravity.

EPHIAL'TES, *ſ.* [from ἐφάλλομαι, Gr. to leap upon.] The medical term for the nightmare; ſo called becauſe it was thought a dæmon leaped upon the breaſt.

EPHI'ELIS, *ſ.* [Gr. *calyculus*; ſo called from the nectary forming a ſort of crown to the corolla.] In botany, a genus of the claſs octandria, order monogynia, The generic characters are—Calyx: perianth one-leafed, five-parted, ſpreading: ſegments roundiſh, acute. Corolla: petals five, having claws, roundiſh, ſpreading, emarginate with a point, the length of the calyx; nectary of ten ſcales, a pair to each petal faſtened to the baſe, roundiſh, villoſe, ſmaller than the petals. Stamina: filaments eight, briſtle-ſhaped, longer than the corolla, inſerted into a gland; anthers four-cornered, roundiſh. Piſtillum: germ ovate, ſurrounded by a gland; ſtyle none, ſtigma blunt. Pericarpium: capſule oblong, compreſſed, grooved on both ſides, one-celled, two-valved. Seeds: two, kidney-form, faſtened to one of the valves in the middle one above the other.—*Eſſential Character.* Calyx five-parted; petals five, with claws; nectary ten ſcales, two to each petal; capſule oblong, one-celled, two-valved, two-ſeeded.

Ephielis guianenſis, a ſingle ſpecies. It is a tree fifty or ſixty feet high, very much branched at top; the middle branches, or thoſe in the centre, being the higheſt, and ſtanding perpendicular: the lower ones are more inclining and horizontal, and ſpread out to a great diſtance: they divide into many branchlets, furniſhed with alternate leaves, each of which is pinnated: the pinnules oppoſite, from four to ſix in number, entire, oval, pointed, of a ſmooth ſurface, and of a bright green: theſe pinnules or leaflets are ſometimes eight inches in length. The flowers grow from the boſoms of the leaves on long pedicels, divided at their extremities into ſeveral ſmaller ones: theſe flowers are very ſmall, and white. This tree grows in the foreſts of Guiana, and there flowers in the month of October.

EPH'OD, [אפוד, Heb.] A ſort of veſtment worn by the Hebrew prieſts. That worn by the high prieſt was richly compoſed of gold, blue, purple, crimſon, and twiſted cotton; and upon the part which came over his two ſhoulders were two large precious ſtones, upon which were engraven the names of the twelve tribes of Iſrael, upon each ſtone ſix names. Where the ephod croſſed the high prieſt's breaſt, was a ſquare ornament, called the breaſt-plate; in which twelve precious ſtones were ſet, with the names of the twelve tribes of Iſrael engraved on them, one on each ſtone. The ephods worn by the other prieſts were of plain linen. *Calmet.*—He made the *ephod* of gold, blue, and purple, and ſcarlet, and fine twined linen. *Exod.* xxxix. 2.

Aray'd in *ephods*; nor ſo few
As are thoſe pearls of morning dew,
Which hang on herbs and flowers. *Sandys.*

EPH'ODES, *ſ.* [from ἐπὶ and ὁδὸς, Gr. a way.] The ducts or paſſages by which the excrements of the body are evacuated. The acceſs or attack of any thing hurtful.

EPH'ORI,

EPH'ORI, powerful magiſtrates at Sparta, who were firſt created by Lycurgus; or, according to ſome, by Theopompus, before Chriſt 760: they were five in number. Like cenſors in the ſtate, they could check and reſtrain the authority of the kings, and even impriſon them, if guilty of irregularities. They fined Archidamus for marrying a wife of ſmall ſtature, and impriſoned Agis for his unconſtitutional behaviour. They were much the ſame as the tribunes of the people at Rome, created to watch with a jealous eye over the liberties and rights of the people. They had the management of the public money, and were the arbiters of peace and war. Their office was annual, and they had the privilege of convening, proroguing, and diſſolving, the greater and leſs aſſemblies of the people. The former was compoſed of 9000 Spartans, all inhabitants of the city; the latter of 30,000 Lacedæmonians, inhabitants of the inferior towns and villages.

EPH'ORUS, a Greek orator and hiſtorian, native of Cumæ, in Æolia, flouriſhed about 352 before Chriſt. He was a diſciple of Iſocrates, at whoſe inſtigation he undertook to write hiſtory. Judiciouſly avoiding the fabulous periods, he commenced with the return of the Heraclidæ into Peloponneſus, and brought down his narration to the twentieth year of Philip of Macedon. This he divided into thirty books, prefixing to each an introduction. It appears that this work was in conſiderable eſteem among the ancients, and it is frequently quoted by Strabo and other writers; yet its miſtakes and miſrepreſentations were not few, and he was likewiſe charged with many plagiariſms. The total loſs of his work is, however, to be regretted. He wrote ſeveral other books on moral, geographical, and rhetorical, topics, all which have periſhed. He might have had the honour of belonging to the court of Alexander, but declined it.

E'PHRAIM, [אפרים Heb. fruitful.] A proper name of men.

E'PHRAIM, the ſecond ſon of the patriarch Joſeph, and the progenitor of one of the twelve tribes of Iſrael, born in Egypt, of Athenah, the daughter of a prieſt or prince of On, towards the latter end of the ſeventeenth century before Chriſt. He was adopted, together with his brother Manaſſeh, by Jacob, when on his death-bed, who decreed that, in the future diſtributions of inheritance among his deſcendants, they ſhould be entitled to rank with his immediate ſons, and be conſidered as the anceſtors of diſtinct tribes. In the manner of pronouncing his bleſſing on them, however, he propheſied that Ephraim, though the youngeſt of Joſeph's ſons, ſhould have pre-eminence over his brother, by proving the father of a much more numerous poſterity; which prediction was verified in the ſubſequent hiſtory of the Iſraelites.

E'PHRAIM, a province of Paleſtine, occupied by the tribe of that name, ſituated in the diſtrict of Samaria; bounded, on the north, by the half tribe of Manaſſeh weſt of Jordan; on the eaſt, by the river Jordan; on the ſouth, by the tribes of Benjamin, Dan, and Simeon; and on the weſt, by the Mediterranean. In ſcripture, it is frequently ſtyled Mount Ephraim; and after the defection of the ten tribes from the houſe of David, formed a part of the kingdom of Iſrael. It contained a great number of cities, of which Samaria was chief, and the metropolis of that kingdom. *Joſh.* xvi.—Alſo the name of a city of Paleſtine, ſituated in Judea, near the Wilderneſs: here Chriſt retired with his diſciples previous to his laſt viſit to Jeruſalem. *John* xi. 54.

E'PHRAIMITE, a deſcendant from Ephraim.

E'PHRAIN, a city of Paleſtine, belonging to the kingdom of Iſrael at the commencement of that kingdom; taken by Abijam or Abijah king of Judah, who annexed it to his kingdom. 2 *Chron.* xiii. 19.

EPHRA'TA, or DUNKARD TOWN, a town of the American States, in Lancaſter county, Pennſylvania, ſituated on the north-weſt ſide of Calico Creek, which, joining the Coneſtoga, falls into the Suſquehannah; twenty-two miles north of Lancaſter, and upwards of ſixty weſt of Philadelphia. It is ſituated in a romantic and ſequeſtered vale, and poſſeſſed by a religious community called Tunkers, who are moſtly of German deſcent, and believe in general redemption. They uſe great plainneſs of dreſs and language, and will neither ſwear, nor fight, nor go to law, nor take intereſt for the money they lend. They have many peculiarities; but their native ſimplicity and innocent manners have acquired them the name of the harmleſs Tunkers. They ſubſiſt by cultivating their lands, by attending a printing-office, a griſt-mill, a paper-mill, an oil-mill, &c. and the ſiſters by ſpinning, weaving, ſewing, &c. Beſides this congregation at Ephrata, there were in 1770, fourteen others of this ſect in various parts of Pennſylvania, and ſome in Maryland. The whole, excluſive of thoſe in Maryland, amounted to upwards of 2000 ſouls.

EPH'RATAH, EPHRATH, BETHLEHEM EPHRATAH, BETHLEHEM JUDAH, or BETHLEHEM, a city of Paleſtine, in the tribe of Judah. Here, in the days of the patriarch Jacob, Rachel died and was buried. It is ſtyled Bethlehem Judah to diſtinguiſh it from another of that name in the tribe of Zebulon: it is likewiſe called the City of David on account of its being the birth-place of that eminent perſon; as it was alſo of David's great antitype and ſucceſſor, the Redeemer of mankind. See BETHLEHEM, vol. ii. p. 930.

EPH'RATH, [Heb. abundance.] The name of a woman.

EPH'RATHITE, a deſcendant of Ephrath the wife of Caleb; an inhabitant of Ephrath; a deſcendant from Ephraim.

E'PHREM (Syrus), a celebrated Chriſtian writer in the fourth century, deacon of Edeſſa, born at Niſibe, in Syria. He was greatly eſteemed by St. Baſil, St. Gregory Nyſſen, and other eminent men. He wrote againſt the opinions of Sabellius, Arius, Apollonarius, the Manichees, &c. and acquired ſuch reputation by his virtue and his works, that he was called the *doctor and the prophet of the Syrians.* He died in 378. The beſt editions of his works are, that of Oxford, in 1708, in folio, and that of Rome, from 1732 to 1736, in Syriac, Greek, and Latin, 6 vols. folio.

EPH'REMOV, a town of Ruſſia, in the government of Tula: thirty-ſix miles ſouth-eaſt of Tula.

EPHREMOVSKA'IA, a fortreſs of Ruſſia, in the government of Ekaterinoſlav: 108 miles north-eaſt of Ekaterinoſlav.

E'PHRON, [Heb. duſt.] A city of Paleſtine, ſituated in the extremity of the province of Judah, near a mountain of that name. Here, in the days of Judas Maccabeus, (it being a ſtrong and well fortified place,) was the garriſon of Lyſias, whom Judas attacked and drove from the city; it was alſo remarkable for denying Judas a paſſage through the city, for which he nearly deſtroyed it. *Joſh.* xv. 9. 1 *Macc.* v. 46—51. 2 *Macc.* xii. 27.

EPH'YDOR, *ſ.* in antiquity, an officer in the Athenian courts of juſtice, who was to provide the plaintiff and defendant with equal water hour-glaſſes. When the glaſs was run out, they were not permitted to ſpeak any further.

EPH'YRA, the ancient name of Corinth, which it received from a nymph of the ſame name, and thence Ephyreus is applied to Dyrrhachium, founded by a Grecian colony. *Virgil.*

EPI'ALUS, *ſ.* [from ηπιος, gently, and αλεαζω, Gr. to heat.] A kind of fever, in which the heat of the patient is tempered with a certain degree of coldneſs.

EPIBA'TÆ, *ſ.* [επιβαται, Gr.] Among the Greeks, marines or ſoldiers who ſerved on-board the ſhips of war.

EPIBATE'RION, *ſ.* A poetical compoſition, in uſe among the ancient Greeks.

EPIBATE'RIUM, *ſ.* [from επι and βαινω, Gr. *inſcendo*; this being a climbing plant. Επιβατηριον is a machine for climbing walls.] In botany, a genus of the claſs monoecia, order hexandria. The generic characters are—I. Male flowers. Calyx: perianthium double, deci-

duous; outer ſix-leaved, very ſmall, flat; inner three-leaved, three times the ſize of the other, with ovate, ſpreading, leaflets. Corolla: petals ſix, leſs than the inner calyx, roundiſh; three outer, interpoſed between the calycine leaflets, three inner. Stamina: filaments ſix, capillary, bowed inwards, the length of the petals; antheræ roundiſh. II. Female flowers on the ſame plant. Calyx and corolla as in the male. Piſtillum: germs three, ſubglobular; ſtyles three, bowed inwards, very ſmall; ſtigmas compreſſed, ſpreading. Pericarpium: drupes three, ſubglobular, mucronate, with the permanent ſtyles. Seed: nut kidney-form, compreſſed, ſlightly grooved.—*Eſſential Character.* Calyx, double; outer ſix-leaved, ſmall; inner three-leaved, large; petals, ſix, three outer, between the calycine leaflets; three inner; drupes three, ſubglobular, mucronate, with the three permanent ſtyles incloſing a kidney-form nut.

Epibaterium pendulum, a ſingle ſpecies, from Forſt. Gen. 108.

EPI'BOLE, *ſ.* [Gr.] The act of throwing in; a figure in rhetoric, in which the repetition of the ſame word occurs at the beginning of ſeveral ſentences; a kind of epanalepſis.

EP'IC, *adj.* [*epicus*, Lat. επος, Gr.] Narrative; compriſing narrations, not acted, but rehearſed. It is uſually ſuppoſed to be heroic, or to contain one great action atchieved by a hero. See POETRY.—From morality they formed that kind of poem and fable which we call *epic. Broome.*

Homer, whoſe name ſhall live in *epic* ſong,
While muſic numbers, or while verſe has feet. *Dryden.*

EPICAR'PIUM, *ſ.* [from επι, upon, and καρπος, Gr. the wriſt.] A topical medicine applied to the wriſt.

EP'ICED, *ſ.* [from επικηδιον, Gr.] A funeral ſong:

And on the banks each cypreſs bow'd his head,
To hear the ſwan ſing her own *epiced.* *W. Browne.*

EPICE'DIUM, *ſ.* [from επικηδιος, Gr.] An elegy; a poem upon a funeral:

You from above ſhall hear each day
One dirge diſpatch'd unto your clay;
Theſe, your own anthems ſhall become,
Your laſting *epicedium.* *Sandys.*

EP'ICENE, *adj.* [from επικοινος, Gr.] Common to both ſexes.

EPICERAS'TICS, *ſ.* [from επι, and κερανυμι, Gr. to mix.] Medicines which by mixing with acrimonious juices temper them, and render them leſs troubleſome.

EPICHARI'KAKY, *ſ.* [from επι, upon, χαρα, joy, and κακον, Gr. evil.] A rejoicing at the miſfortunes of others. *Scott.*

EPICHAR'MUS, a philoſopher and writer of comedy, ſuppoſed to have been a native of Cos, but to have been brought very young into Sicily, whence he has uſually paſſed for a Sicilian. He was a diſciple in the Pythagorean ſchool; and upon being prevented by the tyranny of king Hiero from publicly profeſſing philoſophy, he applied to dramatic poetry, and is reckoned by Ariſtotle the earlieſt writer of comedy. He was a fertile compoſer; for Suidas aſſigns to him fifty-two comedies, and the induſtry of modern philologiſts has aſcertained the titles of forty; but of theſe ſome fragments only are left. He taught at Syracuſe, and is ſaid to have been the inventor of the two Greek letters, θ and χ. He wrote alſo commentaries upon phyſical and medical ſubjects. Among his fragments are ſome moral ſentences which do him honour: ſuch are—Be ſober in thought, be ſlow in belief; theſe are the ſinews of wiſdom—The gods ſet up their favours at a price, and induſtry is the purchaſer—Live ſo as to be prepared either for a long life or a ſhort one—He who is naturally inclined to good is noble, though his mother were an Ethiop. He lived to the great age of ninety-ſeven.

EPICHIRE'MA, *ſ.* [from επι, upon, and χειρεω, Gr. to labour with the hand.] An attempt, an endeavour; a prolix kind of argument to prove a point.

EPICHI'RESIS, *ſ.* [from επι, upon, and χειρεω, Gr. to labour.] An attempt, a dexterity, a readineſs at diſſecting animal bodies.

EPICOPHO'SIS, *ſ.* [from επι, and κωφος, Gr. deaf.] The medical term for a total deafneſs.

EPICRA'SIS, *ſ.* [Gr.] A gradual evacuation of bad humours in the blood by degrees.

EPICRI'SIS, *ſ.* [Gr.] A judging of a diſeaſe.

EPICTE'TUS, an eminent philoſopher of the Stoic ſchool, who flouriſhed in the firſt century of the Chriſtian era, born at Hieropolis in Phrygia, in a ſervile condition, and ſold as a ſlave to Epaphroditus, one of Nero's freed-men. Having by ſome means obtained his freedom, Epictetus retired to a little hut, where, enjoying only the bare neceſſaries of life, he cloſely devoted his time to the ſtudy of philoſophy. After a diligent application, by which he became thoroughly converſant in the principles of the Stoic ſect, he commenced his philoſophical lectures, and ſoon acquired great popularity as a moral preceptor. He was an acute and judicious obſerver of manners; bold and animated in his reprehenſions of vice; ſimple, impreſſive, and conciliating, in his precepts and inſtructions; and free from that vanity and rudeneſs which were too commonly affected by philoſophers. The morals which he inculcated were of the pureſt kind; and his life was a ſhining example of true independence of ſpirit, contentment, magnanimity, temperance, humility, and modeſty. He was accuſtomed to ſay, that the ſum of moral inſtruction may be compriſed in two words ανεχε και απεχε, *i. e.* endure and abſtain, or bear and forbear. When the philoſophers were baniſhed from Italy under the tyranny of the monſter Domitian, he was involved in their fate; but he bore his exile with true philoſophic firmneſs, conſidering himſelf as a citizen of the world, and knowing that wherever he went he carried his beſt treaſures along with him. He fixed his reſidence at Nicopolis in Epirus, where he proſecuted the great object to which he had devoted his life, by reproving vice and folly, and expatiating on the true means of attaining contentment and happineſs. We have no certain account either of the time or manner of his death. There ſeems, however, reaſon to conclude, from the mention that is made of him by Aulus Gellius, and by the emperor Marcus Aurelius, that he died towards the cloſe of Adrian's reign. Excepting ſome fragments preſerved by Antoninus, Gellius, Stobæus, and others, the only remains of this philoſopher are to be found in the beautiful manual, or Enchiridion, and the Diſſertations, collected by Arrian, and drawn up from notes taken by himſelf and others from Epictetus's lips. The ſame diſciple wrote alſo a large account of the life and death of Epictetus, which has not reached modern times. Simplicius likewiſe has left a commentary upon his opinions in the eclectic manner. On the whole, the doctrine of Epictetus breathes the genuine ſpirit of the Stoic ſchool. The doctrine of the immortality of the ſoul he firmly maintained, and ſpeaks of the happineſs of good men after death, in terms which might ſuit a better ſyſtem than that of inevitable neceſſity. He ſtrongly oppoſed the opinion which ſome of the Stoics held, reſpecting the lawfulneſs of ſuicide: and it may truly be ſaid, that the ſyſtem of practical virtues which he recommends, approaches nearer than that of any inſtructor, not enlightened by revelation, to the purity of Chriſtian morality. Some of the beſt editions of this philoſopher's remains are thoſe publiſhed at Leyden, in 1670, in octavo, *cum notis variorum*; at Utrecht, in 1711, in quarto; at Oxford, in 1740, in octavo, by Joſeph Simpſon, together with *Cebetis Tabula, Prodici Hercules*, &c. and at London, in 1742, by J. Upton, in two volumes quarto, which is the moſt valuable of them all. They have been tranſlated into various languages; and the edition in this country

moſt

moſt eſteemed, is that by Mrs. Carter, publiſhed in 1758, with notes.

E'PICURE, *ſ.* [*epicureus*, Lat.] A follower of Epicurus; a man given wholly to luxury.—The *epicure* buckles to ſtudy, when ſhame, or the deſire to recommend himſelf to his miſtreſs, ſhall make him uneaſy in the want of any ſort of knowledge. *Locke.*

Then fly falſe thanes,
And mingle with the Engliſh *epicures*. *Shakeſpeare.*

EPICU'REAN, *adj.* Luxurious; contributing to luxury:

Tie up the libertine in a field of feaſts,
Keep his brain fuming; *epicurean* cooks,
Sharpen with cloyleſs ſauce his appetite. *Shakeſpeare.*

Containing, or attached to, the doctrines of Epicurus.—The *Epicurean* doctrine, as explained by Lucretius, though widely different from the Peripatetic in many things, is almoſt the ſame in this. *Reid.*

EPICURE'AN, *ſ.* One of the Epicurean ſect.—Thus the atomiſt or *Epicurean* pleading for a vacuum. *Shafteſbury.*

EPICURE'ANISM, *ſ.* An attachment to Epicurean doctrines.—Theſe lines can never be tortured into *Epicureaniſm*. *Ja. Harris.*

To EPI'CURISE, *v. a.* [from *Epicurus.*] To devour like an epicure. *Not uſed:*

While I could ſee thee full of eager pain
My greedy eyes *epicuris'd* on thine. *Flatman.*

E'PICURISM, *ſ.* Luxury; ſenſual enjoyment; groſs pleaſure.—Some good men have ventured to call munificence, the greateſt ſenſuality, a piece of *epicuriſm*. *Calamy.*

EPICU'RISM, *ſ.* [accented on the third ſyllable.] The principles of Epicurus.—The firſt book of the Enquiry ends with a ſentence far remote from irreligion and *epicuriſm*. *J. Warton's Pope.*

EPICU'RUS, one of the greateſt philoſophers of his age, born at Gargettus, near Athens, in the third year of the 109th olympiad, or 342 before Chriſt. His parents were among the number of Athenian citizens who were ſent to coloniſe the iſland of Samos, after it had been ſubdued by Pericles. Here he is ſaid to have early imbibed a taſte for literature and philoſophy, and to have attended on different maſters at Samos, and the neighbouring iſland of Teos; from whence he removed to Athens. In that city he continued the proſecution of his ſtudies till he was twenty-three years of age; after which he improved himſelf, and enriched his mind by travelling. He firſt opened a ſchool at Mitylene, which he continued for about a year, and then removed it to Lampſacus, where he was attended with diſciples from Colophon and other places. After four years, he became diſſatisfied with the narrow ſphere in which he moved, and determined to fix his reſidence at Athens; to which city he returned when he was about thirty-ſix years old. Upon his arrival at Athens, he purchaſed for his ſchool a pleaſant garden, where he taught his ſyſtem of philoſophy to a great number of diſciples. Hence the Epicureans were called "the philoſophers of the garden." In the ſtate of luxurious refinement which then prevailed at Athens, the new ſyſtem came recommended, to young minds eſpecially, with much more powerful attractions than the very ſubtle and ſevere ſyſtems taught in other ſchools; and the garden was ſoon crowded with ſcholars from all the cities of Greece and Aſia, and even from Egypt. Epicurus diſcarded all unnatural ſeverity; was diſtinguiſhed by a captivating addreſs, and great urbanity of manners; and held it out as the profeſſed deſign of his doctrine, to lead men to true pleaſure, by natural and eaſy ſteps, in the paths of virtue. By thus rendering ſmooth the brow of philoſophy, it is not a matter of wonder that his doctrines became exceedingly popular. From the opening of his philoſophical ſchool at Athens, Epicurus confined himſelf to that city, except when he paid occaſional viſits to his friends in Ionia; and lived there in a ſtate of celibacy, for the ſake of proſecuting his ſtudies with leſs interruption. His conduct, according to the confeſſion of the moſt candid enemies to his opinions, was ſtrictly moral, and exemplary for temperance and abſtemiouſneſs; and he conſtantly inculcated upon his followers the pureſt manners, and the careful government of their paſſions, as the beſt means of enjoying a tranquil and happy life. Through the intenſeneſs of mental application, his conſtitution became enfeebled towards the cloſe of his days, and he was afflicted with the ſtrangury, and a dyſentery. Finding that his end was approaching, he bequeathed his garden, and the buildings belonging to it, to his friend Hermachus, who was his immediate ſucceſſor in his ſchool, and after him to the future profeſſors of his philoſophy. He died in the ſeventy-third year of his age, while exhorting his ſurrounding diſciples not to forget the doctrines which he had taught them. No perſon's memory was ever held in higher reſpect by his followers than that of this philoſopher. They not only celebrated his birth-day, but the whole month in which he was born, as a perpetual feſtival. So great was the regard for his authority, that his ſchool was never divided; and his followers formed a ſort of philoſophical republic, exempt from diſputes and miſunderſtandings, regulated by one judgment, and animated by one ſoul. Epicurus has notwithſtanding been accuſed of impiety; of inſolence and contempt; of being addicted to the vileſt and moſt ſcandalous vices; and of being an enemy to all manly purſuits. But the greater part of theſe accuſations is to be aſcribed either to envy and calumny, or to miſconception and miſrepreſentations of his principles. His doctrine was warmly attacked by the philoſophers of the different ſects, and particularly by the Stoics. They obſerved that he diſgraced the gods by repreſenting them as inactive, given up to pleaſure, and unconcerned with the affairs of mankind. But he refuted all the accuſations of his adverſaries by the purity of his morals, and by his frequent attendance on places of public worſhip. When Leontium, one of his female pupils, was accuſed of proſtituting herſelf to her maſter and to all his diſciples, the philoſopher proved the falſity of the accuſation by ſilence, and an exemplary life. Of all the philoſophers of antiquity, Epicurus is the only one whoſe writings deſerve attention for their number. He wrote no leſs than three hundred volumes, according to Diogenes Laertius; and Chryſippus was ſo jealous of the fecundity of his genius, that no ſooner had Epicurus publiſhed one of his volumes, but he immediately compoſed one, that he might not be overcome in the number of his productions. Epicurus, however, advanced truths and arguments unknown before; but Chryſippus ſaid, what others long ago had ſaid, without ſhewing any thing which might be called originality. The followers of Epicurus were ſo numerous, that his doctrines were rapidly diſſeminated over the world; but, when the gratification of the ſenſe was ſubſtituted to the practice of virtue, the morals of mankind were undermined and deſtroyed. Even Rome, whoſe auſtere ſimplicity had happily nurtured virtue, felt the attack, and was corrupted. When Cyneas ſpoke of the tenets of the Epicureans in the Roman ſenate, Fabricius indeed intreated the gods that all the enemies of the republic might become his followers. But thoſe were the feeble efforts of expiring virtue; and when Lucretius introduced the popular doctrine in his poetical compoſition, the ſmoothneſs and beauty of the numbers contributed, with the effeminacy of the Epicureans, to enervate the conquerors of the world.

The principles of the EPICUREAN PHILOSOPHY, were as follow: No *thing* can ſpring from nothing, nor can any *thing* return to nothing. The univerſe always exiſted, and will always remain; for there is nothing into which it can be changed. There is nothing in nature, nor can any thing be conceived, beſides *body*, and *ſpace*. Body is that which poſſeſſes the properties of bulk, figure, reſiſtance, and gravity; it is this alone which can touch, or be touched. Space, or *vacuum*, deſtitute of the pro-

perties of body, incapable of action or paſſion, is the region which is or may be occupied by body, and which affords it an opportunity of moving freely. That there are bodies in the univerſe, is atteſted by the ſenſes. That there is alſo ſpace, is evident; ſince otherwiſe bodies would have no place in which to move or exiſt; and of their exiſtence and motion we have the certain proof of perception. Beſides theſe, no third nature can be conceived. The univerſe, conſiſting of body and ſpace, is infinite, for it has no limits. Bodies are infinite in multitude; ſpace is infinite in magnitude. The univerſe is to be conceived as immovable, and as eternal and immutable; nevertheleſs, the parts of the univerſe are in motion, and are ſubject to change. All bodies conſiſt of parts, of which they are compoſed, and into which they may be reſolved; and theſe parts are either themſelves ſimple principles, or may be reſolved into ſuch. Theſe firſt principles, or ſimple *atoms*, are diviſible by no force, and therefore muſt be immutable. A finite body cannot conſiſt of parts infinite, either in magnitude or number; diviſibility of bodies *in infinitum* is therefore inconceivable. All atoms are of the ſame nature, or differ in no eſſential qualities. From their different effects upon the ſenſes, it appears, however, that they differ in magnitude, figure, and weight. Gravity muſt be an eſſential property of atoms; for, ſince they are perpetually in motion, or making an effort to move, they muſt be moved by an internal impulſe, which may be called gravity. Atoms, by this internal force, are carried forwards in a direction which is nearly, but not exactly, rectilineal; and whilſt they paſs through free ſpace, this declination from the right line occaſions a caſual concurrence of corpuſcles of different forms. In compound maſſes of atoms, the efforts of ſome of the particles towards motion in different directions being repreſſed by the efforts of others, an univerſal agitation muſt take place. The principle of gravity being eſſential to the primary corpuſcles or atoms, they muſt have been neceſſarily and from eternity in actual motion. Atoms are not only the elements from which all things are compounded, but that energy or principle of motion which eſſentially belongs to them, is the ſole agent in the operations of nature. Every compound body poſſeſſes the energy of all the atoms of which it is compoſed, but variouſly modified according to the reſpective figures and relative ſituations of its component parts. All the changes which take place in the figure, and other properties of bodies, conſiſt in local motion. As different words are formed from the different combinations of the ſame letters, ſo different qualities are produced by the different arrangement of the ſame particles. Bodies are more or leſs rare, in proportion to the magnitude of the vacuities which intercept the ſolid atoms of which they are compoſed. Tranſparency, hardneſs and ſoftneſs, flexibility, ductility, and other qualities, are to be explained upon theſe principles. From the combination of the properties of atoms, and the qualities of bodies already enumerated, ariſe other properties and faculties, which are likewiſe to be traced up to the principle of motion; as heat and cold. Pleaſure and pain, motion and reſt, and even time, are accidents of bodies. The world, or that portion of the univerſe which includes the whole circumference of the heavens, the heavenly bodies, the earth, and all viſible objects, is to be conceived as one whole, on account of the contiguity and relation of its parts; but there is no proof that it is an organiſed and animated body. The world is not eternal, but began at ſome time to exiſt; for, ſince every thing in the world is liable to the viciſſitudes of production and decay, the world itſelf muſt be ſo too. The formation of the world may be conceived to have happened thus: A finite number of that infinite multitude of atoms, which, with infinite ſpace, conſtitute the univerſe, falling fortuitouſly into the region of the world, were in conſequence of their innate motion collected into one rude and indigeſted maſs. In this chaos, the heavieſt and largeſt atoms, or collections of atoms, firſt ſubſided, whilſt the ſmaller, and thoſe which from their form would move moſt freely, were driven upwards. Theſe latter, after many reverberations, roſe into the outer region of the world, and formed the heavens. Thoſe atoms which were by their ſize and figure ſuited to form fiery bodies, collected themſelves into ſtars. Thoſe which were not capable of riſing ſo high in the ſphere of the world, being diſturbed by the fiery particles, formed themſelves into air. At length, from thoſe which ſubſided was produced the earth. By the action of air, agitated by heat from the heavenly bodies upon the mixed maſs of the earth, its ſmoother and lighter particles were ſeparated from the reſt, and water was produced, which flowed by its nature into the loweſt places, in the firſt combination of atoms, which formed the chaos, various ſeeds aroſe; which, being preſerved, and nouriſhed by moiſture and heat, afterwards ſprung forth in organiſed bodies of different kinds. The world is preſerved by the ſame mechanical cauſes by which it was framed; and from the ſame cauſes it will at laſt be diſſolved. The inceſſant motion of atoms, which produced the world, is continually operating towards its diſſolution; for nothing is ſolid and indiſſoluble but atoms. Whence it may be concluded, that the time will come, when nothing will remain but ſeparate atoms and infinite ſpace. The earth, which was formed of heavy particles, ſubſiding to the loweſt place, is ſituated in the middle of the world. Not that there is any point within the earth which is the centre of gravity. The doctrine that there are upon the earth antipodes, is falſe. The earth is in form a circular plane; it is prevented from falling towards the lower region by the air, with which it is congenial, and upon which therefore it does not preſs; their mutual action deſtroying the effect of gravity. Earthquakes are cauſed by the agitation of internal winds and water, or by the decay and ſudden fall of columns, by which portions of the earth's ſurface are ſupported. Or the internal winds may be converted into fires, which may cauſe ſudden and violent eruptions, as in mount Ætna. Foſſils and plants are produced by the neceſſary impulſe of nature, that is, by the motion of atoms, cauſing continual tranſpoſition, accretion, or diminution, in individual bodies. They have no vital principle, and can therefore only be ſaid analogically to live or die. Animals having being once formed, at the beginning of the world, by the caſual conjunction of ſimilar atoms, the production of animal bodies is ſtill continued in a conſtant and determinate order. The parts of animals were not originally framed for the uſes to which they are now applied; but, having been accidentally produced, they were afterwards accidentally employed. The eye, for example, was not made for ſeeing, nor the ear for hearing; but the ſoul, being formed within the body at the ſame time with theſe organs, and connected with them, could not avoid making uſe of them in their reſpective functions. The ſoul is a ſubtle corporeal ſubſtance, compoſed of the fineſt atoms; which, by the extreme tenuity of its particles, is able to penetrate the whole body, and to adhere to all its parts. Notwithſtanding the ſubtlety of its texture, it is compoſed of four diſtinct parts: fire, which cauſes animal heat; an ethereal principle, which is moiſt vapour; air; and a fourth principle, which is the cauſe of ſenſation. This ſentient principle differs eſſentially from the three former; but it is, like the reſt, corporeal, becauſe it is capable both of acting and being acted upon by bodies. Theſe four parts are ſo perfectly combined as to form one ſubtle ſubſtance, which, whilſt it remains in the body, is the cauſe of all its faculties, motions, and paſſions, and which cannot be ſeparated from it without producing the entire diſſolution of the animal ſyſtem. Different ſenſations are the caſual effects of the different organs which the ſoul in its union with the body is capable of employing, and of the different properties and qualities of external objects. Theſe become ſenſible by means of certain ſpecies, or images, which are perpetually paſſing,

paſſing, like thin films, from bodies, in form ſimilar to the ſurfaces of the bodies themſelves, and ſtriking upon organs fitted to receive them. The mind, or intellect, in which is lodged the power of thinking, judging, and determining, is compoſed of particles moſt ſubtle in their nature, and capable of the moſt rapid motion. The ſeat of this moſt excellent part of the ſoul, ſeems to be in the middle of the breaſt, or the heart, which we perceive to be the region of thoſe affections which are excited by cogitation. Thought is produced by ſubtle images, which find their way through the body, and, when they arrive at the intellect, move it to think. The affections and paſſions of the ſoul may be reduced to two, pleaſure and pain: the former, natural and agreeable; the latter, unnatural and troubleſome. Whilſt all the parts of the ſoul remain in their natural ſtate, it experiences nothing but pleaſurable tranquillity; but from the various motions which take place either in ourſelves, or in the objects round us, the ſoul is liable either to be dilated by the approach of images ſuitable to its nature, and therefore pleaſant, or to be contracted by contrary impreſſions. Sleep is produced when the parts of the ſoul which are at other times diffuſed through the body are repreſſed or ſeparated by the action of the air, or of food. Dreams are the effects of images caſually flying about, which from their extreme tenuity penetrate the body and ſtrike upon the mind, exciting an imaginary perception of thoſe things of which they are images. Death is the privation of ſenſation, in conſequence of the ſeparation of the ſoul from the body, when the former is diſperſed into the corpuſcles or atoms of which it was compoſed, and therefore can no longer be capable of thought or perception. In the heavens, or ethereal regions, the ſun, moon, and ſtars, appear to be fiery bodies; or they may be ſmooth mirrors, from which bright fiery particles flowing through the ethereal region, are reflected to the earth; or they may be deep veſſels, containing fires, &c. The apparent motion of the heavenly bodies may ariſe from the revolution of the whole heaven in which they are fixed, like nails in a ſolid body; or by the revolution of the bodies themſelves through the heavens. The cauſe of the motion of the heavenly bodies may either be an internal neceſſity in the nature of the bodies themſelves, or the external preſſure of ſome ethereal fluid: but to aſſert any thing poſitively upon this ſubject, becomes thoſe who affect an oſtentatious diſplay of knowledge. The opinion concerning the exiſtence of the gods is an innate principle, producing univerſal conſent; it muſt therefore be true. But it is inconſiſtent with our natural notions of the gods, as happy and immortal beings, to ſuppoſe that they encumber themſelves with the management of the world, or are ſubject to the cares and paſſions which muſt neceſſarily attend ſo great a charge. We are therefore to conceive, that the gods have no intercourſe with mankind, nor any concern with the affairs of the world. Nevertheleſs, on account of their excellent natures, they are proper objects of reverence and worſhip. Becauſe the human figure is the moſt perfect, and the only form that admits of reaſon and virtue, we muſt conceive that the gods reſemble men in their external ſhape; but we are not to ſuppoſe them to be groſs bodies, conſiſting of fleſh and blood, but thin ethereal ſubſtances, endued with ſenſation and intellect, and, from their peculiar nature, incapable of decay. The place of their reſidence is unknown to mortals; but we may be aſſured that, wherever it be, it is the manſion of perfect purity, tranquillity, and happineſs.

In this ſummary of Epicurus's Syſtem of Phyſics will be found ſuch a degree of ignorance with reſpect to the true principles of the phenomena of nature, as ſhews the author to have been very ill qualified to ſolve the grand problem concerning the origin and formation of the world. It involves in it wild and fanciful hypotheſes, which are not only unſupported by natural appearances, but contrary to the known and indiſputable laws of nature. Though his ſyſtem admits the exiſtence of gods, yet the idea which it gives concerning their nature, is degrading to the proper character of the Deity, and cannot be at all explained in congruity with the fundamental principles of his own philoſophy. Epicurus's Ethics conſtitute the leaſt exceptionable part of his ſyſtem, and, when fairly conſidered, will be found for the moſt part conformable to reaſon and nature. The following is a ſummary of them. The end of living, or the ultimate good, which is to be ſought for its own ſake, is happineſs; yet men, for the moſt part, fail in the purſuit of this end, either becauſe they do not form a right idea of the nature of happineſs, or becauſe they do not make uſe of proper means to attain it. Since it is every man's intereſt to be happy through the whole of life, it is the wiſdom of every one to employ philoſophy in the ſearch of it. The happineſs which belongs to man is that ſtate in which he enjoys as many of the good things, and ſuffers as few of the evils, incident to human nature, as poſſible; paſſing his days in a ſmooth courſe of permanent tranquillity. It is impoſſible that perfect happineſs can be poſſeſſed without the pleaſure that attends freedom from pain, and the enjoyment of the good things of life. Pleaſure is in its nature good, as pain is in its nature evil; the one is therefore to be purſued, and the other to be avoided, for its own ſake. Pleaſure or pain is not only good, or evil in itſelf, but the meaſure of what is good or evil in every object of deſire or averſion; for the ultimate reaſon why we purſue one thing and avoid another is, becauſe we expect pleaſure from the former, and apprehend pain from the latter. Although all pleaſure is eſſentially good, and all pain eſſentially evil, it doth not thence neceſſarily follow, that in every ſingle inſtance the one ought to be purſued, and the other to be avoided; but reaſon is to be employed in diſtinguiſhing and comparing the nature and degrees of each, that the reſult may be a wiſe choice of that which ſhall appear to be, upon the whole, GOOD. There are two kinds of pleaſure; one conſiſting in a ſtate of reſt, in which both body and mind are undiſturbed by any kind of pain; the other ariſing from an agreeable agitation of the ſenſes, producing a correſpondent emotion in the ſoul. It is upon the former of theſe that the enjoyment of life chiefly depends. Happineſs may therefore be ſaid to conſiſt in bodily eaſe and mental tranquillity. It is the office of reaſon to confine the purſuit of pleaſure within the limits of nature, in order to the attainment of that happy ſtate, in which the body is free from every kind of pain, and the mind from all perturbation. This ſtate muſt not, however, be conceived to be perfect in proportion as it is inactive and torpid, but in proportion as all the functions of life are vigorouſly and pleaſantly performed. This happy ſtate can only be attained by a prudent care of the body, and a ſteady government of the mind. The diſeaſes of the body are to be prevented by temperance, or cured by medicine, or rendered tolerable by patience. Againſt the diſeaſes of the mind, philoſophy provides ſufficient antidotes. The inſtruments which it employs for this purpoſe are the virtues; the root of which, whence all the reſt proceed, is prudence. This virtue comprehends the whole art of living diſcreetly, juſtly, and honourably, and is in fact the ſame thing with wiſdom. It inſtructs men to free their underſtandings from the clouds of prejudice; to exerciſe temperance and fortitude in the government of themſelves; and to practiſe juſtice towards others. Although pleaſure, or happineſs, which is the end of living, be ſuperior to virtue, which is only the means, it is every one's intereſt to practiſe all the virtues; for in a happy life pleaſure can never be ſeparated from virtue. A prudent man, in order to ſecure his tranquillity, will conſult his natural diſpoſition in the choice of his plan of life. Temperance is that diſcreet regulation of the deſires and paſſions by which we are enabled to enjoy pleaſures without ſuffering any conſequent inconvenience. They who maintain ſuch a ſelf-command as never to be enticed by the proſpect

of

of prefent indulgence to do that which will be productive of evil, obtain the trueſt pleaſure by declining pleaſure. Sobriety, as oppoſed to inebriety and gluttony, is of admirable uſe in teaching men that nature is ſatisfied with a little, and enabling them to content themſelves with ſimple and frugal fare. Such a manner of living is conducive to the preſervation of health; renders a man alert and active in all the offices of life; affords him an exquiſite reliſh of the occaſional varieties of a plentiful board; and prepares him to meet every reverſe of fortune without the fear of want. Continence is a branch of temperance, which prevents the diſeaſes, infamy, remorſe, and puniſhment, to which thoſe are expoſed who indulge themſelves in unlawful amours. Muſic and poetry, which are often employed as incentives to licentious pleaſures, are to be cautiouſly and ſparingly uſed. Gentleneſs, as oppoſed to an irafcible temper, greatly contributes to the tranquillity and happineſs of life, by preſerving the mind from perturbation, and arming it againſt the aſſaults of calumny and malice. A wiſe man, who puts himſelf under the government of reaſon, will be able to receive an injury with calmneſs, and to treat the perſon who committed it with lenity. Refractory ſervants in a family ſhould be chaſtiſed, and diſorderly members of a ſtate puniſhed, without wrath. Moderation, in the purſuit of honours or riches, is the only ſecurity againſt diſappointment and vexation. A wiſe man, therefore, will prefer the ſimplicity of ruſtic life to the magnificence of courts. Future events a wiſe man will conſider as uncertain, and will therefore neither ſuffer himſelf to be elated with confident expectation, nor to be depreſſed by doubt and deſpair; for both are equally deſtructive of tranquillity. It will contribute to the enjoyment of life, to conſider death as the perfect termination of a happy life, which it becomes us to cloſe like ſatisfied gueſts, neither regretting the paſt, nor anxious for the future. Fortitude, the virtue which enables us to endure pain and to baniſh fear, is of great uſe in producing tranquillity. Philoſophy inſtructs us to pay homage to the gods, not through hope or fear, but from veneration of their ſuperior natures. It moreover enables us to conquer the fear of death, by teaching us that it is no proper object of terror; ſince whilſt we are, death is not, and when death arrives, we are not; ſo that it neither concerns the living nor the dead. The only evils to be apprehended are bodily pain and diſtreſs of mind. Bodily pain it becomes a wiſe man to endure with patience and firmneſs; becauſe, if it be ſlight, it may eaſily be borne, and if it be intenſe, it cannot laſt long. Mental diſtreſs commonly ariſes not from nature, but from opinion; a wiſe man will therefore arm himſelf againſt this kind of ſuffering, by reflecting that the gifts of fortune, the loſs of which he may be inclined to deplore, were never his own, but depended upon circumſtances which he could not command. If therefore they happen to leave him, he will endeavour as ſoon as poſſible to obliterate the remembrance of them, by occupying his mind in pleaſant contemplations, and engaging in agreeable avocations. Juſtice reſpects man as living in ſociety, and is the common bond, without which no ſociety can exiſt. This virtue, like the reſt, derives its value from its tendency to promote the happineſs of life. Not only is it never injurious to the man who practiſes it, but nouriſhes in his mind calm reflections and pleaſant hopes; whereas it is impoſſible that the mind in which injuſtice dwells ſhould not be full of diſquietude. Since it is impoſſible that iniquitous actions ſhould promote the enjoyment of life as much as remorſe of conſcience, legal penalties, and public diſgrace, muſt increaſe its troubles, every one who follows the dictates of ſound reaſon will practiſe the virtues of juſtice, equity, and fidelity. In ſociety, the neceſſity of the mutual exercife of juſtice, in order to the common enjoyment of the gifts of nature, is the ground of thoſe laws by which it is preſcribed. Nearly allied to juſtice are the virtues of beneficence, compaſſion, gratitude, piety, and friendſhip. He who confers benefits upon others procures to himſelf the ſatisfaction of ſeeing the ſtream of plenty ſpreading round him from the fountain of his beneficence: and at the ſame time he enjoys the pleaſure of being eſteemed by others. The exerciſe of gratitude, filial affection, and reverence for the gods, is neceſſary, in order to avoid the hatred and contempt of all men. Friendſhips are contracted for the ſake of mutual benefit; but by degrees they ripen into ſuch diſintereſted attachments, that they are continued without any proſpect of advantage. Between friends there is a kind of league that each will love the other as himſelf. A true friend will partake of the wants and ſorrows of his friend as if they were his own: if he be in want he will relieve him; if he be in priſon he will viſit him; if he be ſick he will come to him; nay, ſituations may occur, in which he would not ſcruple to die for him. It cannot then be doubted that friendſhip is one of the moſt uſeful means of procuring a ſecure, tranquil, and happy, life.

From this ſummary of the Ethics of Epicurus, it will readily be ſeen how unjuſtly his enemies miſrepreſented his doctrine, when they ſtated that it offered encouragement to the practice of vice and licentiouſneſs, and how illiberally they perverted his ſenſe of the term *pleaſure*, when he taught that it was the ultimate end of living. By the notions, however, which it propagated reſpecting the gods, it certainly contributed, in common with the principles of the atheiſtic ſects, and of others who denied the immortality of the ſoul, greatly to weaken the motives to virtue. It muſt, however, be acknowledged that his doctrine was very early much abuſed, and that the greater part of thoſe who pretended to belong to the epicurean ſchool, reflected diſgrace on the ſect by their diſſoluteneſs of manners. This was the caſe at Athens, and afterwards at Rome. In the modern epicurean ſchools in France, the members have been more diſtinguiſhed by their literary refinement, poliſhed manners, and luxurious indulgences, than their culture of the genuine doctrine of the Greek philoſopher.

EPICY'CLE, *ſ.* [επι and κυκλος, Gr.] A little circle whoſe center is in the circumference of a greater; or a ſmall orb, which, being in the deferent of a planet, is carried along with its motion; and yet, with its own peculiar motion, carries the body of the planet faſtened to it round about its proper centre. It was by means of epicycles that Ptolemy and his followers ſolved the various phenomena of the planets, but more eſpecially their ſtations and retrogradations.

Gird the ſphere
With centric and eccentric, ſcribbl'd o'er;
Cycle and *epicycle*, orb in orb. *Milton.*

EPICY'CLOID, *ſ.* [from επι, κυκλος, and ειδος, Gr. form.] In geometry, a curve generated by the revolution of the periphery of a circle along the convex or concave part of another circle.

EPICYE'MA, *ſ.* [from επι upon, and κυω, Gr. to conceive.] Superfœtation. Superimpregnation. A ſecond conception before the fœtus of the firſt is diſmiſſed from the womb.

EPIDAM'NUS, a town of Macedonia on the Adriatic, nearly oppoſite Brunduſium. The Romans planted there a colony which they called *Dyrrachium*, conſidering the ancient name ominous. *Pauſanias.*

EPIDAPH'NE, a town of Syria, called alſo Antioch. Germanicus, ſon of Druſus, died there. *Tacitus.*

EPIDAU'RIA, a feſtival anciently kept at Athens in honour of Æſculapius.—A country of Peloponneſus.

EPIDAU'RUS, a town at the north of Argolis in Peloponneſus, chiefly dedicated to the worſhip of Æſculapius, who had there a famous temple. It received its name from Epidaurus, a ſon of Argus and Evadne. It is now called *Pidaura. Virgil.*—A town of Dalmatia, now *Raguſi Vecchio.*—A town of Laconia, in the Ionian Sea, now *Molvaſia*, in the Morea.

EPIDE'MIC,

EPIDE'MIC, or EPIDEMICAL, *adj.* [from επι, upon, and δημος, Gr. the people.] That which falls at once upon great numbers of people, as a plague.—See the article MEDICINE.—As the proportion of *epidemical* diſeaſes ſhews the aptneſs of the air to ſudden and vehement impreſſions, the chronical diſeaſes ſhew the ordinary temper of the place. *Graunt.*—Generally prevailing; affecting great numbers.—The more *epidemical* and prevailing this evil is, the more honourable are thoſe who ſhine as exceptions. *South.*—General; univerſal: *not uſed, nor proper*:

They're citizens o' th' world, they're all in all;
Scotland's a nation *epidemical.* *Cleaveland.*

EPIDEN'DRUM, *ſ.* [επι δενδρον, Gr. from its growing upon trees.] In botany, a genus of the claſs gynandria, order diandria, natural order orchideæ. The generic characters are—Calyx: ſpathes vague; ſpadix ſimple; perianthium none. Corolla: petals five, oblong, extremely long, very ſpreading; nectary tubular at the baſe, top-ſhaped, placed downwards within the petals, with an oblique two-cleft mouth; the ſuperior lip very ſhort, three-cleft; the inferior lengthened into a point. Stamina: filaments two, very ſhort, ſitting on the piſtil; antheræ covered by the upper lip of the nectary. Piſtillum: germ ſlender, long, twiſted, inferior; ſtyle very ſhort, faſtened to the upper lip of the nectary; ſtigma obſcure. Pericarpium: ſilique extremely long, columnar, fleſhy. Seeds: numerous, extremely ſmall.—*Eſſential Character.* Nectary, turbinate, oblique, reflex; corolla, ſpreading; ſpur, none.

Deſcription. The whole genus is obſcure in its character, differences, and ſynonyms; for the flowers in dried ſpecimens can hardly be unfolded: the plants are cultivated with difficulty in gardens; and the ſpecies have not been ſufficiently deſcribed by authors who have had an opportunity of ſeeing them in America and the Eaſt Indies, their native places of growth. Linnæus had only thirty ſorts in his Species Plantarum, and the number was not increaſed in the twelfth and thirteenth editions of the Syſtema Vegetabilium. In the fourteenth edition of the ſame work, two only are added by Murray from Jacquin, who has eleven other new ſpecies in his Stirpium Americanarum Hiſtoria. Swartz has forty-nine from the Weſt-Indies, ſome of which are the ſame with Jacquin's. Retzius has twenty-three obſerved by Koenig in the Eaſt Indies. And Forſter has ten from the iſlands in the South Seas. The number of ſorts here regiſtered amounts to 125, and doubtleſs there are many more, ſince Dr. Smith, in his elegant works, has figured two ſpecies from Jamaica, which eſcaped the reſearch of the indefatigable Swartz. On a ſeverer ſcrutiny, however, ſome of theſe numerous ſpecies may turn out to be varieties, and others to be the ſame ſpecies repeated. Jacquin remarks, that all his ſpecies, particularly the ſmaller ones, become by age more or leſs ceſpitoſe, and run over the bark of trees with their numerous roots, fixing themſelves into it with a conſiderable degree of firmneſs.

Species. I. Climbing. 1. Epidendrum vanilla, vanilla or vanelloe: leaves ovate-oblong, nerved, ſeſſile, cauline, tendrils ſpiral. The vanilla is ſeparated from the other epidendrums by Plumier, Juſſieu, Miller, and others; ſtem trailing, ſomewhat like common ivy, but not ſo woody, faſtening itſelf to whatever tree grows near it, by ſmall fibres or roots produced at every joint, by which it may receive nouriſhment when cut or broken off from the root a conſiderable height above the ground; the leaves are as large as thoſe of the common laurel, but not quite ſo thick; they are placed alternate at the joints, which are ſix or ſeven inches aſunder, and are of a lively green colour above, but paler underneath; the ſtems ſhoot into many branches, which alſo faſten themſelves to the boughs of trees, and thus riſe to the height of eighteen or twenty feet, ſpreading quite over ſmaller trees; the flowers are of a greeniſh yellow colour, mixed with white, and are ſucceeded by fruit ſix or ſeven inches long. The manner of growth and flowering, the ſize of the flowers, fruit, and lens-ſhaped, dark-ſhining ſeeds, without any aril, diſtinguiſh this from the other ſpecies. Vanilla, with E. flos aeris and claviculatum, might be ſeparated from the genus epidendrum. Native of South America and the iſlands in old woods, in the moiſt ſhady parts of them. In the bay of Campeachy, at Carthagena, the Caraccas, Honduras, Darien, Cayenne, &c. the fruit is gathered and preſerved. When it turns of a yellow colour, and begins to open, they gather it, and lay it in ſmall heaps to ferment two or three days, in the ſame manner as is practiſed for the cocoa or chocolate pods; then they ſpread them in the ſun to dry; and when they are about half dried, they ſtat them with their hands, and afterwards rub them over with the oil of palma Chriſti, or of the cocoa; then they expoſe them to the ſun again to dry, and afterwards they rub them over with oil a ſecond time; then they put them in ſmall bundles, covering them with the leaves of the Indian reed, to preſerve them. Theſe plants produce but one crop of fruit in a year, which is commonly ripe in May, fit for gathering, for they do not let them remain on the plants to be perfectly mature, becauſe then they are not ſo fit for uſe; but when they are about half changed yellow, they eſteem them better for keeping than when they are changed to a dark brown colour, at which time the fruit ſplits, and ſhews a great quantity of ſmall ſeeds, which are incloſed within it. While the fruit is green, it affords no remarkable ſcent, but as it ripens it emits a moſt grateful aromatic odour. When the fruit begins to open, the birds attack it and devour all the ſeeds very greedily, but do not eat any other part of the fruit. The fruits which are brought to Europe are of a dark brown colour, about ſix inches long, and ſcarce an inch broad; they are wrinkled on the outſide, and full of a vaſt number of black ſeeds, like grains of ſand, of a pleaſant ſmell, like balſam of Peru. The fruit is only uſed in England as an ingredient in chocolate, to which it gives a pleaſant flavour to ſome palates, but to others it is very diſagreeable; but the Spaniſh phyſicians in America uſe it in medicine, and eſteem it grateful to the ſtomach and brain for expelling wind, to provoke urine, to reſiſt poiſon, and cure the bite of venomous animals. The Spaniards, French, and Italians, not only uſe the vanilla to give chocolate a delicate ſmell and agreeable flavour, but alſo to perfume ſnuffs and other ſubſtances. It yields a great quantity of oil and volatile ſalt.

Mr. Miller has another ſpecies, which he calls *Vanilla axillaris*, and diſtinguiſhes by its oblong, blunt, compreſſed, jointed leaves, and axillary flowers. It was ſent him from Carthagena in New Spain, where it grows naturally. It has a climbing ſtalk, ſending out roots from the joints, like the other, and mounting to a great height. The leaves, which come out ſingly at each joint, are oblong, ſmooth, and jointed. The flowers come out from the ſide of the branches; they are ſhaped like thoſe of the great bee-orchis, but are longer: the helmet is of a pale pink, and the lip is purple. It flowered in the Chelſea garden, but lived only one year. There are two or three varieties of the common vanilla, differing in the colour of their flowers, and the length of their pods.

2. Epidendrum flos aeris: ſtem columnar, ſomewhat branched; leaves lanceolate; petals linear, obtuſe. The flowers reſemble a ſpider. It is a native of Java, and is paraſitical. See No. 112.

II. Stem upright, leafy. 3. Epidendrum tenuifolium, or thin-leaved epidendrum: leaves on the ſtem ſubulate, channelled. Native of Malabar in the Eaſt Indies.

4. Epidendrum ſpatulatum, or flatted epidendrum: leaves on the ſtem oblong, alternate, obtuſe, veinleſs; lip of the nectary bifid and divaricate. 5. Epidendrum ſurvum, or dark epidendrum: cauleſcent; leaves imbricate, lanceolate; racemes axillary. Natives of the Eaſt Indies.

6. Epidendrum coccineum, or ſcarlet vanilla: leaves

on the ſtem enſiform, obtuſe; peduncles one-flowered, axillary, crowded. This is an elegant paraſitical plant. Roots round, numerous, fibrous, aſh-coloured; ſtems ſeveral, ſcarcely attaining to a foot in height; before theſe ſpring the flowers come forth in the axils of the root-leaves; they are void of ſcent, and ſcarlet. Native of Martinico, in moiſt woods, eſpecially by the ſide of torrents; alſo in Jamaica, but not common. Cultivated at Kew in 1794.

7. Epidendrum ſecundum, or inferior epidendrum: leaves on the ſtem oblong, emarginate; ſtem compreſſed; ſpike directed one way; tube of the nectary length of the corolla. Paraſitical. Roots fibrous, white; ſtem round at bottom, gradually compreſſed, leafy, pendulous; leaves ſeſſile, ſheathing, alternate, ſpreading in two rows, the outmoſt tip emarginate, veinleſs; peduncle ſcape-form, often two feet long, terminating, compreſſed, jointed as it were by the deciduous ſheaths; flowers terminating, in form of a corymb, nodding one way, pale red or brown. It varies with a rounder and more compreſſed ſtem; leaves broader, or more acuminate; flowers terminating, or breaking out on the ſide; and tube of the nectary ſhorter or longer than the petals. Native of Martinico and Jamaica, in mountainous woods. Cultivated at Kew in 1794.

Swartz is of opinion that *E. anceps* of Jacquin is no more than a variety of this. Jacquin thus deſcribes it: Paraſitical, half a foot high or ſomewhat more; roots fibrous, round; ſtem compreſſed, ancipital at top, with few leaves; leaves oblong, blunt, coriaceous, alternate, ſheathing. Native of Martinico.

8. Epidendrum lineare, or linear epidendrum: leaves on the ſtem diſtich, linear, obtuſe, emarginate; ſtem ſimple; flowers terminating in a ſort of ſpike; lip entire. Stems ſimple, heaped, tufted, from one to two feet long, erect, filiform, leafy, compreſſed a little, ſmooth; ſeeds extremely minute, duſty and briſtly; as Jacquin ſays, irregularly ſhaped like ſaw-duſt. Native of thick mountain woods in Martinico, and other of the Weſt India iſlands; flowering in ſpring. Cultivated at Kew in 1794.

9. Epidendrum punctatum, or dotted epidendrum: leaves lanceolate, nerved; ſheaths imbricate; ſcape panicled; and corollas dotted. 10. Epidendrum caudatum, or tailed epidendrum: leaves lanceolate, nerved; ſcape panicled; petals ſpotted, tailed, two very long. Natives of America.

11. Epidendrum ovatum, or ovate epidendrum: leaves on the ſtem ovate, acute; ſtem claſping, nerved; ſcapes panicled. Native of the Eaſt Indies.

12. Epidendrum ciliare, or ciliated epidendrum: leaves oblong, veinleſs; lip of the nectary three-parted, ciliate, the middle ſegment linear; ſtem two-leaved. This is an elegant plant, a foot and half high, paraſitical on the trunks of vaſt trees, from which it hangs down towards the ground; ſpike looſe, compoſed of about ten handſome white flowers, four inches in diameter, all pointing one way. Native of Martinico. Cultivated at Kew in 1794.

13. Epidendrum nocturnum, or nocturnal epidendrum: leaves oblong, veinleſs; lip of the nectary three-parted, quite entire; the middle ſegment linear; ſtem many-leaved. Native of the mountain woods in Martinico, and in Jamaica, but not common. It ſmells very ſweet during the night.

14. Epidendrum cucullatum, or hooded epidendrum: leaves ſubulate; ſcape one-flowered; lip of the nectary ovate, ciliate, acuminate; petals elongated. Native of America. Cultivated at Kew in 1794.

15. Epidendrum teres, or taper epidendrum: ſtem ſheathed, decumbent; leaves columnar. Native of Japan.

III. Scape naked; leaves radical. 16. Epidendrum nodoſum, or knotty epidendrum: leaf ſingle, ſubradical; ſpadix containing about four flowers. Native of the Weſt Indies, near the coaſt; flowering in ſpring.

17. Epidendrum carinatum, or carinated epidendrum: leaves oblong, obtuſe, compreſſed, jointed. Native of the Philippine iſlands, on trees.

18. Epidendrum aloifolium, or aloe-leaved vanilla: leaves oblong, obtuſe, broader at the end. Root thick, fungous, crinite, knobbed, paraſitical; leaves ſeveral from the knob of the root, from two to three feet long, and two fingers broad, ſmooth, ſhining, browniſh green, thick; flowering-ſtems ſeveral, undivided, round, green, ſhining; three of the petals are narrow, oblong, of a fine red colour within, with white edges, on the outſide white and green, in ſtreaks, with a tinge of red; nectary yellow, with red lines. Native of Malabar, on different trees.

19. Epidendrum guttatum, or dotted epidendrum: leaves lanceolate, channelled; petals wedge-ſhaped, retuſe. From a matted root this ſends out ſeveral leaves three inches long, and not a quarter of an inch broad, almoſt triangular, and of a yelloviſh green colour. From the midſt of theſe comes the flowering-ſtalk. Each flower is made up of four little white petals, ſpotted with brown, and one large one with fewer ſpots, on which is a ſmall yellow hood, and oppoſite to it one like it of a blue colour; on pedicels an inch long, round the top of the ſtalk. Native of Jamaica, on the ebonies.

20. Epidendrum juncifolium, or ruſh-leaved epidendrum: leaves ſubulate, furrowed; ſcape and petals dotted; lip without dots, dilated. Native of America.

21. Epidendrum ſcriptum, or marked vanilla: leaves ovate-oblong, three-nerved; flowers racemed, ſpotted. Native of the Eaſt Indies.

22. Epidendrum retuſum, or retuſe epidendrum: leaves linear, retuſe at the end, in two rows; flowers racemed, ſpotted. Three feet in height; root white, woody, bent in, curled, fixing itſelf into the bark of trees by its capillary hairy fibres; ſtem riſing between two rows of leaves, ſimple, ſhining, ſmooth, marked with rings; the leaves which come out from the top of the ſtem, and when dry, conſtitute the ſtem itſelf, are oblong-narrow, equally thick and broad on every ſide, folded together, ſmooth, ſhining, without any viſible veins or nerves. Native of Malabar, where it flowers in April and October, the flowers continuing two months; and a branch ſet in water will flower for a month.

23. Epidendrum amabile, or lovely epidendrum: leaves broad-lanceolate, veinleſs; petals lateral, orbiculate. Roots thick, like packthread; ſtem two feet high, naked, ſurrounded by a few acute, very ſhort, ſcales; flowers ſnow-white, the ſize of narciſſus flowers. Obſerved in the Eaſt Indies by Oſbeck; on branches of trees, on the coaſt of Java, alſo, by Rumphius. The flowers are large and odoriferous; lying in a room, they do not wither for ſeveral days, and fill it with a moſt agreeable ſmell. On the iſle of Ternate, none but princeſſes are allowed to wear this precious flower.

24. Epidendrum cochleatum, or ſpiral epidendrum: leaves oblong, double, ſmooth, ſtreaked, growing on the bulb; ſcape many-flowered; nectary cordate. Native of the mountainous parts of Jamaica. This is one of the few ſpecies yet introduced; we are obliged to Mr. Alexander Anderſon for it in 1786. It flowers here in January and February.

25. Epidendrum tuberoſum, or tuberous epidendrum: leaves broad-lanceolate, nerved, membranaceous, growing on the bulb; ſcape ſheathed; nectary boat-form, bifid. This a native of America. Linnæus ſets it down as the growth of both Indies, ſuppoſing it to be the Angræcum terreſtre primum of Rumphius, which Swartz aſſures us it is not, becauſe it is drawn without leaf-bearing bulbs, and is ſaid to grow on the ground. It is probably a ſpecies of Limodorum. Loureiro has deſcribed a plant cultivated in the gardens of China and Cochinchina, as the E. tuberoſum of Linnæus; but as he refers to Rumphius, and ſays that it is not paraſitical on trees, but grows on the ground; it may alſo be a Limodorum, or at leaſt is a different ſpecies from this.

26. Epidendrum puſillum, or dwarf epidendrum: leaves enſiform, ſomewhat fleſhy; ſcape few-flowered. Root fibrous; plant little more than an inch high. Obſerved in Surinam by Dahlberg.

27. Epidendrum enſifolium, or ſword-leaved epidendrum: ſtem round, even; leaves enſiform; petals lanceolate; lip lanceolate, recurved, dotted. The flowers have a ſweet lemon-like odour, pungent but not ſtrong, moſt remarkable at night or on entering the hot-houſe in a morning. On account of this perfume, the plant is much cultivated in China. Native of China and Japan.

28. Epidendrum moniliforme, or necklace epidendrum: ſtem round, jointed, ſtreaked, necklace-form, naked, quite ſimple; leaves linear, acute; flowers white; common on walls and in hedges in Japan; paraſitical. Thunberg, in his travels through Japan, obſerved it at Miſima, tied up in bundles, and hung out before a houſe. It can live ſeveral years without water or other nouriſhment, and yet grow and flower all the while.

29. Epidendrum ophioglosſoides, or harts-tongue epidendrum: ſtem one-leafed; flowers racemed, pointing one way. Native of America.

30. Epidendrum ruſcifolium, or rough-leafed epidendrum: ſtem one-leafed; flowers from the ſinus of the leaf aggregate. Native of the high mountains of Jamaica, on the trunks of old trees; and in the thick woods of Martinico. Cultivated at Kew in 1794.

31. Epidendrum graminifolium, or graſs-leafed epidendrum: ſtem one-leafed; flowers from the ſinus of the leaf in pairs. Native of America.

32. Epidendrum Capenſe, or Cape epidendrum: ſcape naked; leaves imbricate in two rows, linear, obtuſe; flowers directed one way; horn very long. Found at the Cape of Good Hope by Thunberg; paraſitical on the trunks of trees.

33. Epidendrum fuſcatum, or brown epidendrum: ſtems ſimple; leaves oval; peduncle terminating, elongated, ſcaly; lip of the nectary five-lobed, the middle lobe minute. This approaches to E. ſecundum; from which it differs in having a column ſhorter than the petals, capitate and purpliſh or browniſh-green flowers, inſtead of violet ones, leaning all one way. Native of Jamaica. Cultivated by the hon. Mrs. Barrington, at Mongewell, in 1791.

34. Epidendrum tripterum, or triangular-fruited epidendrum: leaves from a bulb and from the root ſword-ſhaped; ſtalks radical ſheathed, many flowered; germ three-winged; lip equal to the petals. Native of Jamaica. It flowered in the garden of the hon. Mrs. Barrington, in February, 1793; alſo in Kew garden, about 1791.

35. Epidendrum Barringtonæ, or large-flowered epidendrum: leaves broad lanceolate, nerved, ariſing from a bulb; peduncles radical, moſtly ſingle-flowered, lip fringed; column with a cover; flower-ſtalks three inches high, nearly erect, bearing one flower, rarely two, round, green, ſmooth; clothed with four or more ſheathing alternate ſcales, which are ovate, concave, green with a ruſty-coloured powdery down. This is the moſt diſtinguiſhed of the ſpecies hitherto introduced among us, not only on account of its ſize, but its ſingularity. Neither this nor the preceding occurred to Dr. Swartz, who inveſtigated the iſland of Jamaica with no leſs ardour than accuracy. It is to be hoped, therefore, that more new ſpecies may hereafter be diſcovered there. Native of Jamaica. It flowered in April, 1791, in the collection of the hon. Mrs. Barrington; and in Chelſea garden the year following.

36. Epidendrum claviculatum, or claſping epidendrum: ſtem climbing, round, branching; leaves ſeſſile, half-ſtem-claſping, acute, concave, recurved, rigid. This plant hangs down from the branches of trees, and creeps up others to forty feet high. Stem jointed at the diſtance of about five inches, and at every joint fibres three or four inches long, catching hold by their broad viſcid end of any part of a tree they come near; it is about three quarters of an inch in diameter, very ſmooth, round and deep green, ſolid, juicy, and ſometimes branched: here and there, oppoſite to the tendril, comes out a thin membranaceous leaf, from a broad beginning ending in a point. Native of Jamaica and Hiſpaniola.

37. Epidendrum ramoſum, or branching epidendrum: ſtem very branching, ſuffruteſcent; leaves linear, emarginate; racemes terminating, compreſſed; plant a foot and an half high, leafy, paraſitical; flowers ſmall, inelegant, greeniſh. Native of Martinico and Jamaica.

38. Epidendrum nutans, or nodding epidendrum: ſtem ſimple; leaves ovate-lanceolate, nerveleſs; ſtem claſping; ſpike terminating, nodding, lip of the nectary three-lobed, the middle lobe three-toothed. Native of Jamaica. Cultivated at Kew, in 1794.

39. Epidendrum umbellatum, or umbelled epidendrum: ſtem ſimple; leaves ovate, emarginate; ſtem-claſping, veinleſs; flowers terminating, umbelled. Common in the vaſt woods of Martinico, and in Jamaica.

40. Epidendrum anceps, or double epidendrum: leaves cordate lanceolate; ſtem-claſping, horizontal; raceme terminating, compreſſed, ancipital; flowers diſtich, larger than the ſpathes; lip entire; cordate ovate, acute. Native of woods in Martinico and Jamaica.

41. Epidendrum rigidum, or ſtiff epidendrum: leaves oblong, obtuſe, ſheathing; raceme terminating, compreſſed, ancipital; flowers diſtich, larger than the ſpathes; lip entire; cordate ovate, acute. Native of woods in Martinico and Jamaica.

42. Epidendrum diffuſum, or diffuſed epidendrum: leaves oblong; ſtem claſping; ſtem ancipital; panicle terminating, very much branched, diffuſed; lip entire, acuminate. 43. Epidendrum montanum, or mountain epidendrum: leaves lanceolate, flat, recurved, ſpreading, ſubmembranaceous; raceme terminating, ſimple; flowers pointing one way; lip trifid. 44. Epidendrum ſerrulatum, or ſerrated epidendrum: ſtems aggregate, ſubdiphyllous; leaves lanceolate, keeled, ſerrulate; raceme terminating; flowers diſtich. 45. Epidendrum teretifolium, or long-leaved epidendrum: leaves ſemicylindric; ſtem one flowered; lip three-ſided at the tip. Natives of Jamaica. Of theſe and others we lament that we have not deſcriptions from the accurate hand of Swartz.

46. Epidendrum globoſum, or globular epidendrum: leaves cylindric, channelled; flowers terminating, ſubſolitary; lip ovate, acute, capſulas globular. Native of the woods of Martinico and Jamaica.

47. Epidendrum ſertularioides, or clover epidendrum: ſtem filiform, creeping, jointed; leaves lanceolate; peduncles one-flowered from radical ſheaths. 48. Epidendrum teſtæfolium, or ſhell-leaved epidendrum: ſtem creeping; leaves incumbent, elliptic, concavo-convex, keeled; flowers ſeſſile under the leaves. Natives of Jamaica.

49. Epidendrum undulatum, or waved epidendrum: leaves elliptic, acute, ſcape ſarmentoſe, very much branched; petals ovate, clawed obtuſe; lip dilated, emarginate, waved. Paraſitical, and the largeſt of its ſort; roots large; leaves many, long, narrow, ſmooth, dark green, ſomewhat like thoſe of our common white lily; ſtalk round, tough, brown crooked, ſix feet high, with joints at every eight or nine inches diſtance, where are branches ſtanding ſtraight out, with ſeveral flowers on peduncles an inch long. Jacquin refers Sloane's plant here deſcribed, to his *altiſſimum*. Swartz thinks that the *carthagenſe* of Jacquin may poſſibly be the ſame with his *undulatum*. Jacquin's plant is a native of Carthagena, in thick woods; that of Swartz, Sloane, and Browne, of Jamaica.

50. Epidendrum variegatum, or variegated epidendrum: leaves lanceolate, keeled, channelled; cartilaginous ſerrate on the edge; ſheaths imbricate; ſcapes ſheathing, with a ſimple raceme, lip eruciate, two lobed. Native of the woods in Jamaica and Hiſpaniola.

51. Epidendrum utricularioides, or bagpipe epidendrum:

drum: leaves lanceolate, marked with lines, flat, ſcape panicled; lip large, heart-ſhaped, horn very ſhort. Native of Jamaica and Hiſpaniola.

52. Epidendrum triquetrum, or three-ſided epidendrum: leaves three-ſided, cultrate, compreſſed at the tip, lanceolate, acute; ſcape ſimple; lip heart-ſhaped, ovate; ſides emarginate. 53. Epidendrum ſeſſile, or ſeſſile epidendrum: leaves compreſſed at the baſe, broader at top, lanceolate linear, obtuſe, veinleſs; peduncles radical, very ſhort, one-flowered. 54. Epidendrum flabelliforme, or fan-ſhaped epidendrum: leaves compreſſed at the baſe, dilated at top, ovate laneeolate, acute, flat, nerved; peduncles one-flowered, elongated. 55. Epidendrum ſubulatum, or awl-ſhaped epidendrum: leaves awl ſhaped, grooved; peduncles ſheathed; radical, many flowered. Natives of Jamaica.

56. Epidendrum ſatyrioides, or rag-wort epidendrum: leaves ſubulate eylindric; ſcape few flowered; eorollas ventrieoſe at the baſe in front. Native of Hiſpaniola.

57. Epidendrum tribuloides, or thiſtle epidendrum: leaves pedicelled, lanceolate, obtuſe, emarginate: peduncles very ſhort, capſules globoſe, echinate. 58. Epidendrum corniculatum, or horned epidendrum: leaves pedicelled, wedge ſhaped, oblong; peduncles radical, one-flowered; corollas acuminate, curved. 59. Epidendrum lanceola, or lanceolate epidendrum: leaves pedicelled, lanceolate, acute; peduncles from radical ſheaths, two-flowered. 60. Epidendrum anguſtifolium, or narrow-leaved epidendrum: leaf linear, growing upon the bulb; ſcape panicled. 61. Epidendrum palmifolium, or palm-leaved epidendrum: leaves broad lanceolate, nerved, membranaceous, growing on the bulb; peduncles radical, ſheathed, many flowered, nectary boat-ſhaped, entire, reflex. Natives of Jamaica. Of all theſe we have no deſcription.

62. Epidendrum altiſſimum, or tall epidendrum: leaves laneeolate, growing on the bulbs; ſcape very much branehed, ſarmentoſe; petals oblong, lanceolate, acute; lip obcordate, ſhorter than the petals. This is an elegant paraſitical plant. Leaves acute, enſiform-oblong, veinleſs, ſhining, quite entire, thickiſh, an inch wide, and half a foot long, keeled at the baſe, in other parts flat, each ſpringing from a joint, or an ovate, compreſſed, ſmooth tuber, ſometimes as big as a gooſe's egg, which is placed on the baſe of another root-leaf or two, like the others. Flowers without ſcent, yellow with brown ſpots, numerous. Native of the woods of Martinico; eultivated at Kew in 1794. Jacquin mentions another, which he names E. violaceum, from its beautiful violet-coloured flowers. He found it on a very tall arboreous cereus, and had not an opportunity of examining it particularly; it appeared to him to have the habit of the ſpeeies thus deſcribed.

63. Epidendrum fragans, or ſweet epidendrum: leaf broad-lanceolate, nerveleſs, growing on the bulb; ſcape many-flowered, abbreviated; lip heart-ſhaped. Native of Jamaica. Introduced here in 1786, by Hinton Eaſt, eſq. It flowers in October.

64. Epidendrum ſanguineum, or bloody epidendrum: leaves in pairs, oblong, growing on the bulb; ſcape many-flowered, ſubflexuoſe; lip roundiſh, waved, emarginate; horn adnate. This has many white thick fibres like thoſe of leeks, or the tendrils of ivy, taking firm hold of the bark of trees, and matted together; theſe ſend up one thick greeniſh, roundiſh, compreſſed, bulbous or tuberous leaf, of an inch diameter, covered with ſome brown withered filaments. From the top of this come two ſmooth ſtriated hollow hard pale green leaves, three inches long and one inch broad, between which ſprings out a naked brown jointed round ſmooth ſtalk, about a foot high, near the top of which ſtand ſeveral long reddiſh purple flowers, very beautiful. Native of Jamaica, on the ebonies and other trees in the ſavanna-woods plentifully: cultivated at Kew in 1794.

65. Epidendrum labiatum, or lipped epidendrum: leaves radical, oblong, middle bulb ſolitary, one-leafed; ſcapes few-flowered; lip oblong, with a fleſhy corpuſcle growing to it at top. Natives of Hiſpaniola.

66. Epidendrum polybulbon, or many-bulbed epidendrum: ſtem creeping; bulb bearing; bulbs two-leaved, one-flowered; flower peduneled; lip heart-ſhaped. 67. Epidendrum proliferum, or proliferous epidendrum: cauleſcent, leaves diſtieh, ſubimbricate ovate; bulbs from the ſheaths of the leaves two-leaved; flowers axillary, ſeſſile. 68. Epidendrum veſtitum, or clothed epidendrum: ſtem leafleſs, imbricate all round with ſheaths, roundiſh; bulb-bearing; bulbs growing on the leaf; flowers erowded from the ſheaths of the ſtem. 69. Epidendrum vomiforme, or Jamaiea epidendrum: cauleſcent; leaves growing on the bulbs, ovate-aeuminate, convex, channelled, three-ſided beneath; ſcapes from the boſom of the leaves. Natives of Jamaica.

70. Epidendrum echinocarpon, or priekly epidendrum: ſtem compreſſed, decumbent, one-flowered; leaves imbricate all round, diſtich, ovate, capſules muricate. Native of Guiana, on the trunks of old trees, which are ſometimes quite covered with it.

71. Epidendrum trichocarpon, or maiden-hair epidendrum: ſtem compreſſed, round, rooting, leaves imbricate all round, diſtieh, linear, capſules tomenteſe. 72. Epidendrum glaucum, or blue epidendrum: ſtem compreſſed, almoſt upright, many-flowered; leaves imbricate all round, diſtich, broad-lanceolate, very ſmooth, glaucous beneath; capſules naked. 73. Epidendrum graminoides, or graſſy epidendrum: ſtem erect, compreſſed, many-flowered; leaves imbricate all round, diſtich, remote, linear; peduncles longer. 74. Epidendrum micranthum, or ſmall-leaved epidendrum: ſtem one-leafed; leaf broad-lanceolate; raceme very long, filiform; flowers pointing one way, roundiſh, ſix-cornered. Natives of Jamaiea.

75. Epidendrum trigoniflorum, or three-ſided epidendrum: ſtem one-leafed; leaf oblong lanceolate; raceme the length of the leaves; flowers moſtly pointing one way, three-cornered. This little paraſitical plant is only about four inches high. Roots fibrous, whitiſh, numerous; flowers ſmall, directed all to the ſame ſide, without ſcent, on ſhort peduncles, of a dirty yellow colour. Native of the mountain woods in Martinico and Jamaica. According to Swartz, Jacquin's *ophioglo ſſoides* is not that of Linnæus, but this ſpecies.

76. Epidendrum racemiflorum, or raceme-flowered epidendrum: ſtem one-leafed, leaf ovate, raceme longer than the leaves; flowers pointing one way; inner petals ovate. Natives of Jamaica.

77. Epidendrum alpeſtre, or Hiſpaniola epidendrum: ſtem one-leafed, leaf ovate-lanceolate; racemes looſe; keels of the capſules muricate. Native of Hiſpaniola.

78. Epidendrum laxum, or ſupple epidendrum: ſtem one-leafed; leaf oblong; raceme the length of the leaves; inner petals awl-ſhaped; lip ovate; capſules naked. 79. Epidendrum ovale, or oval epidendrum: ſtem one-leafed; leaf ovate, acuminate; raceme preſſed cloſe; many-flowered; petals roundiſh; the inner ones remote in front at the baſe, capſules pedicelled. 80. Epidendrum pulchellum, or red epidendrum: ſtem one-leafed; leaf roundiſh, acute; raceme looſe; few-flowered; petals acuminate, ciliate, the inner one croſſed at the tip. 81. Epidendrum tridentatum, or three-toothed epidendrum: ſtem one-leafed; leaf ovate-acute; three-toothed at the tip; raceme many-flowered; flowers three-ſided, acuminate; petals of the nectary erect, bowed inwards. 82. Epidendrum cochlearifolium, or ſpiral-leafed epidendrum: ſtem one-leafed; leaf orbiculate, concavo-convex; raceme few-flowered. 83. Epidendrum funale, or corded epidendrum: leafleſs, filiform, rooting; peduncle two-flowered; lip two-lobed; horn very long, awl-ſhaped. Natives of Jamaica. 84. Epidendrum filiforme, or filiform epidendrum: leafleſs; filiform; rooting; peduncles ſubtriflorous; lip ovate; horn very ſhort, headed at the tip. Native of Hiſpaniola. Of all theſe ſpecies, from 36 to 84, we expect

pect deſcriptions from the accurate hand of Dr. Swartz, the firſt diſcoverer of them.

85. Epidendrum concretum, or concrete epidendrum: leaves radical, lanceolate, acute; nectary concrete with the petals; paraſitical, a foot high. Native of Martinico.

86. Epidendrum cebolleta, or bulbous epidendrum: leaf radical ſingle, awl-ſhaped; knot rooted; raceme compound. Leaf round, acute, ſlightly grooved within, ſmooth, fleſhy, at bottom a finger in thickneſs, in length from one to two feet, but ſometimes four feet, ending at the baſe in a knot or roundiſh tubercle, permanent after the leaf is decayed. The natives call it *cebolletas*, (cibouls or little bulbs,) and make uſe of the tubercles triturated with ſalt in violent contuſions, fractures, &c. The whole plant is void of ſmell. Native of Carthagena in woods, eſpecially on the coaſt.

87. Epidendrum ſpathulatum, or ſheathed epidendrum: leaves bifarious, alternate, approximating; præmorſe, with a doubled tip, coriaceous, ſcarcely a foot long. 88. Epidendrum variegatum, or varied epidendrum: leaves alternate, ſpreading, ſheathing, ovate acute, three-nerved, waved, ſmooth, variegated. Swartz has given the ſame name to an American ſpecies: ſee No. 50. 89. Epidendrum calceolariæ, or ſhoe epidendrum: leaves bifarious, alternate, remote, ſpreading very much, awl-ſhaped, thick, ſmooth. 90. Epidendrum hexandrum, or ſix-parted epidendrum: leaves bifarious, alternate, ſpreading, a little ſeſſile, ending in ſheaths, ſomewhat remote, lanceolate, emarginate with a point, rigid. 91. Epidendrum ophrydis, or eye-brow epidendrum: leaves alternate, ſheathing, from erect ſpreading, ovate, acute, quite entire, nerved, ſmooth; a little bulbed on the ſurface; membranaceous; ſhorter than the ſcape; ending in tubular, keeled, ſmooth ſheaths. 92. Epidendrum ſupplex, or proſtrate epidendrum: leaves crowded, ſword-ſhaped, ſheathing, compreſſed, quite entire, acute, ſmooth, fleſhy. 93. Epidendrum orchideum, or olive epidendrum: leaves bifarious, alternate, ſeſſile, ſpreading, lanceolate, quite entire, acute, ſmooth, fleſhy, rigid. 94. Epidendrum puſillum, or dwarf epidendrum: ſhoots in bundles; appreſſed; a ſpan long; racemes ſolitary, ſimple, upright, compreſſed, naked at bottom, toothletted towards the tip, ſmooth. 95. Epidendrum complanatum, or flat epidendrum: leaves alternate, ſeſſile, ſpreading, linear-moon-ſhaped, retuſe, ſmooth; upper ſurface concave, lower keeled; fleſhy. 96. Epidendrum clavatum, or clubbed epidendrum: leaves alternate, ſeſſile, ſpreading, a little linear-club-ſhaped, with two unequal teeth at the end, ſmooth, flat, having a large nerve, depreſſed above, permanent beneath. 97. Epidendrum ſubulatum, or ſubulate epidendrum: leaves alternate, erect, ſeſſile, awl-ſhaped, cylindric, ſmooth, acute; ſheaths obtuſe, margined, ſmooth, with minute dark-purple dots, ſhort. Swartz gave the ſame name to No. 55. 98. Epidendrum nudum, or naked epidendrum: ſtem none; peduncles ſimple, one-flowered, with two or three ſmooth membranaceous tubular ſheaths, inveſting the younger peduncles with an oblique mouth, caducous. 99. Epidendrum tomentoſum, or rugged epidendrum: leaves from the bulbs uſually four, ſeldom two or three, alternate, almoſt erect, bifarious at the baſe, half-ſheathing the bulb, oblong, quite entire, acute, concave, recurved at the tip, ſmooth, eight-nerved, fleſhy. 100. Epidendrum bidentatum, or two-toothed epidendrum: leaves ſheathing each other, three or four, ſeldom five, ſword-ſhaped, bifarious, ſeſſile, quite entire, with two ſharp toothlets at the tip, ſmooth on both ſides, keeled at the back. 101. Epidendrum lycopodioides, or lycopodon epidendrum: ſtems crowded at the roots, pendulous, ſimple, compreſſed; leaves alternate, bifarious, ſheathing one another at the baſe, preſſed cloſe above the ſheaths, lanceolate, acute, a little margined, ſmooth, fleſhy. 102. Epidendrum longiflorum, or long-flowered epidendrum: leaves growing to the bulbs, ſolitary, ſubpetioled, erect, lanceolate-retuſe, margin quite entire, recurved, ſmooth, fleſhy, rigid, brittle. 103. Epidendrum flabellum, or fan epidendrum: leaves ſolitary, one from each bulb, erect, petioled, lanceolate oblong, quite entire, emarginate, a little recurved, obſcurely nerved, ſmooth, fleſhy, rigid. 104. Epidendrum ſaaroniçum: leaves alternate, ſubbifarious, ſeſſile, ſpreading, lanceolate, flattiſh, above even, ſtreaked ſlightly, and having five more evident nerves, beneath ſmooth, with a ſmall groove along the midrib, but no ſtreaks, emarginate, fleſhy, rigid. 105. Epidendrum plantaginifolium, or plantain-leaved epidendrum: leaves bifarious, ſheathing each other, erect, linear-three-ſided, ſlightly channelled, ſharpiſh, ſmooth, fleſhy, narrow at the baſe next the ſheaths. 106. Epidendrum ſeſſile, or ſeſſile epidendrum: leaves ſcattered from ſeſſile bulbs, ſpreading, ſubpetioled, retuſe, above ſmooth, a little channelled, beneath convex, fleſhy. 107. Epidendrum liliifolium, or lily-leaved epidendrum: leaves from the bulbs ſubpetioled, erect at the baſe, more ſpreading at the tip, linear lanceolate, ſharpiſh, ſmooth, keeled at the back, membranaceous, ſcarcely rigid. 108. Epidendrum calceolariæ terreſtre, or earth epidendrum: leaves ſpreading, bifarious, ſeſſile, ending in ſheaths, oblong-lanceolate, quite entire, ſlightly and obliquely emarginate, above even, ſhining, beneath ſmooth, with from nine to fourteen nerves, rigid, the lower ones ſhort, broader, the upper longer, and ſcarcely an inch broad. 109. Epidendrum flos aeris, or doubtful epidendrum: leaves from bulbs, ovate oblong, acute, flat, fleſhy. This having the name of flos aeris with a note of interrogation, is ſuſpected to be the ſame with No. 2. Theſe twenty-three ſpecies are natives of the Eaſt-Indies, where they were diſcovered by Koenig, and are deſcribed by him at great length, as may be ſeen in the ſixth faſciculus of Retzius's obſervations. Moſt of the ſpecies are new ones, not mentioned by any other author. A few of them, however, are probably deſcribed and figured by Rumphius. Neither Koenig nor Retzius have given any diagnoſes or ſpecific characters.

110. Epidendrum triſte, or ſad epidendrum: leaves cylindric, empty, ſheaths fiſtuloſe; peduncles oppoſite to the leaves, corymbed, perforating the ſheath; lip of the nectary entire, ſpatulate-heart-ſhaped. 111. Epidendrum criſpatum, or criſped epidendrum: leaves cauline, round, filiform, ſubincurved, empty, ſeſſile; raceme quite ſimple; lip of the nectary with the middle ſegment revolute, waved, crenate. 112. Epidendrum equitans, or equitant epidendrum: leaves equitant, enſiform-compreſſed, keeled, acuminate; ſcape naked, raceme ſpiked; nodding, filiform. 113. Epidendrum myoſurus, or mouſe-ear epidendrum: leaves ſheathing at the baſe, obliquely divaricate, linear, obtuſe, channelled; ſcape naked; raceme ſpiked, nodding, filiform. 114. Epidendrum biflorum, or two-flowered epidendrum: leaves diſtich, linear-lanceolate, acute; peduncles two-flowered, ſolitary, perforating the ſheaths of the leaves; lip of the nectary trifid, acuminate. 115. Epidendrum autumnale, or autumnal epidendrum: leaves cauline, lanceolate, nerved, crowded, ſheathing, peduncles terminating, ſcaly, panicled, lip of the nectary erect, retuſe. 116. Epidendrum faſciola, or banded epidendrum: leaves rooting, paraſitical, bundled, linear, waved; ſcapes ſeveral; racemed; lip of the nectary flipper-ſhaped, with a ſpur. 117. Epidendrum umbellatum, or umbelled epidendrum: runners creeping; leaves oval, fleſhy, petioled; petioles fixed into ovate angular-keeled apophyſes, ſcape rooted, umbel ſimple, one-ſided, loweſt petals elongated. 118. Epidendrum reſupinatum, or inverted epidendrum: leaves cauline, petioled, ovate, acuminate, quite entire, plaited, keeled, five-nerved; raceme ſimple, ſpiked; flowers inverted; lower lip of the nectary toothed. 119. Epidendrum clypeolum, or ſhielded epidendrum: leaf radical, roundiſh, cordate, cowled at the baſe, reflex and ſharp at the tip, ſcape almoſt erect, racemed; lower lip of the nectary orbiculate, emarginate, very large. Theſe are all natives of the newly-diſcovered iſlands in the South Seas. They are all ſuppoſed to be new, except No. 118, which is figured in Hortus Malabaricus. Forſter, in his appendix to his Florula

Auſtralis, mentions another ſpecies to be found in the Society iſles, to which he gives the name of *diſtichum*; and a ſecond, to which he does not give any trivial name. We have to lament that we have hitherto no deſcriptions of theſe ſpecies.

120. Epidendrum nervoſum, or nerved epidendrum: ſcape angular; leaves ovate, nerved; lip entire, reflex. Native of Japan between Oſacca and Jedo: flowering in May and June.

121. Epidendrum ſtriatum, or ſtriated epidendrum: ſcape angular, ſmooth, leaves ſword-ſhaped, nerved, petals lanceolate, lip oblong, flat. Leaves radical, four or five, ſheathing, entire, ſmooth, unequal, an inch wide, a ſpan long. Native of Japan, flowering in June. Though this be Limodorum ſtriatum of the Flora Japonica, yet it is diſtinct from the plant of the ſame name in Kæmpf. ic. ſel. t. 2. which is a very beautiful paraſite, found on trees among the Circar mountains; it flowers during the wet ſeaſon.

122. Epidendrum teſſelatum, or teſſelated epidendrum.

123. Epidendrum præmorſum, or truncated epidendrum.

124. Epidendrum pendulum, or pendulous epidendrum. Theſe three inhabit the ſame places as No. 121.

125. Epidendrum vanda, or Indian epidendrum. Added by ſir W. Jones. This lively lovely plant attaches itſelf chiefly to the higheſt Amras and Bilvas (the Mangifera and Crataeva of *Linn.*); but it is an air plant, and lives (ſays the preſident) in a pot without earth or water: its leaves are excavated upwards, to catch and retain dew.

Propagation and Culture. Since Miller's time numerous ſpecies of this fine and very ſingular genus have been introduced into our gardens, and ſome of them cultivated with ſucceſs by the ſuperior ſkill of modern practice, which deſpairs not of rearing and preſerving any plants where expence is not regarded. It requires, however, great ſkill and attention to overcome the united difficulties which attend the cultivation of plants which are at the ſame time of the Orchis tribe and paraſitical. Dr. Smith ſays, we have ſcarcely ſeen any one ſpecies of this genus, except in a dry ſtate, before the year 1787, when E. cochleatum flowered for the firſt time in the ſtove, at Kew; nor was it till October, 1788, that E. fragrans of Swartz exhibited its fragrant and elegant bloom in the ſame rich collection. At preſent ſeveral ſpecies are to be ſeen flowering in ſpring or autumn. They are all cultivated in the ſtove, with very great heat; being moſtly paraſitical, they flouriſh beſt with fragments of half-rotten bark at their roots. They may be increaſed by parting their roots, or what are commonly called offſets, of which they generally have plenty. See LYCOPERDON.

EPIDER'MIS, *ſ.* [from επι, upon, and δερμα, the ſkin.] The ſcarf-ſkin, or cuticle, which lies upon and covers the true ſkin.—See ANATOMY, vol. i. p. 586.

EPIDID'YMIS, *ſ.* [from επι, upon, and διδυμος, a teſticle.] That body on the upper part of the teſticles, formed from a continuation of the tubes which conſtitute the teſticles.—See ANATOMY, p. 618.

EPI'DIUM, one of the weſtern iſles of Scotland, or the Mull of Cantyre. *Ptolemy.*

EPID'OSIS, *ſ.* [from επιδιδωμι, Gr.] The medical term for a preternatural enlargement of any part of the body.

EPIDO'TÆ, certain deities who preſided over the birth of children. They were worſhipped by the Lacedæmonians, and chiefly invoked by thoſe who were perſecuted by the ghoſts of the dead, &c. *Pauſanias.*

E'PIEZ, a town of France, in the department of the Loiret, and chief place of a canton, in the diſtrict of Beaugency: twelve miles weſt of Orleans.

EPIGÆ'A, *ſ.* [επιγαια, Gr. lying or creeping on the ground.] In botany, a genus of the claſs decandria, order monogynia, natural order bicornes. The generic characters are—Calyx: perianthium double, approximated, permanent: perianthium-exterior three-leaved; leaflets ovate-lanceolate, acuminate; the exterior large: perianthium-interior five-parted, upright, a little longer than the exterior; leaflets lanceolate, acuminate. Corolla: one-petalled, ſalver-form; tube cylindric, as long as the calyx or longer, hirſute within; border ſpreading, five-parted; lobes ovate-oblong. Stamina: filaments ten, filiform, length of the tube, affixed to the baſe of the corolla; antheræ oblong, ſharp. Piſtillum: germ globoſe, villoſe; ſtyle filiform, length of the ſtamens; ſtigma obtuſe, ſubquinquefid. Pericarpium: capſule ſubgloboſe, depreſſed, five-cornered, five-celled, five-valved. Seeds: very many, roundiſh; receptacle large, five-parted.—*Eſſential Character.* Calyx, outer three-leaved; inner five-parted; corolla, ſalver-form; capſule, five-celled.

Species. 1. Epigæa repens, creeping epigæa, or trailing arbutus: leaves cordate-ovate, entire, flat, ſharp; corollas cylindric. It is a low plant, with a trailing ſhrubby ſtalk, which puts out roots at the joints, and when in a proper ſoil and ſituation, multiplies very faſt; the ſtalks are garniſhed with oblong rough leaves which are waved on their edges; the flowers are produced at the end of theſe branches in looſe bunches; they are white, and divided at the top into five acute ſegments, which ſpread open in form of a ſtar. It flowers in July, but does not produce fruit in England. Native of Virginia and Canada.

2. Epigæa cordifolia, or heart-leaved epigæa: leaves heart-ſhaped, roundiſh, ſerrate, convex, hiſpid, rigid, corollas ovate. Native of Guadaloupe.

Propagation and Culture. The firſt ſpecies is a plant eaſily propagated by its trailing ſtalks, which put out roots at the joints, may be cut off from the old plant and placed in a ſhady ſituation and a moiſt ſoil: the beſt time for this is in autumn, that the plants may be well rooted before the ſpring. If the winter ſhould prove very ſevere, it will be proper to lay a few dried leaves, or ſome ſuch light covering, over them, which will prevent their being injured by froſt; and after they are well rooted, they will require no farther care but to keep them clean from weeds.

EPIGÆ'UM, *ſ.* [επιγαιον, Gr.] The part of a circle in which a planet moves, which is neareſt to the earth, oppoſed to the apogæum.

EPIGAS'TRIC, *adj.* [*epigaſtricus*, Lat. επιγαστριον, Gr. the epigaſtrium.] Belonging to the epigaſtrium.

EPIG'ASTRIUM, [from επι upon, and γαστηρ, Gr. the belly.] The upper fore-part of the belly, reaching from the pit of the ſtomach, nearly to the navel. See ANATOMY.

EPIGEI'OS, *ſ.* in botany. See ARUNDO.

EPIGENNE'MA, *ſ.* [from επιγινομαι, Gr. to generate upon.] With phyſicians, a ſymptom ſupervening upon another ſymptom. Any thing growing upon another, as a fur upon the tongue.

EPIGLOT'TIS, *ſ.* in botany. See ASTRAGALUS.

EPIGLOT'TIS, [from επι, upon, and γλωττις, Gr. the aperture of the larynx.] The leaf-like cartilage which covers the glottis whilſt we ſwallow, to prevent any thing from falling into it. See ANATOMY.

EPIGLOT'TUM, *ſ.* [from επιγλωττις, Gr. the epiglottis, which it reſembles in ſhape.] In ſurgery, an inſtrument for elevating the eye-lids.

EPIGLU'TIS, *ſ.* in anatomy. That part of the thigh which is joined to the hip.

EPIG'ONI, the ſons and deſcendants of the Grecian heroes who were killed in the firſt Theban war. The war of the Epigoni is famous in ancient hiſtory. It was undertaken ten years after the firſt. The ſons of thoſe who had periſhed in the firſt war, reſolved to avenge the death of their fathers, and marched againſt Thebes, under the command of Therſander; or, according to others, of Alcmæon the ſon of Amphiaraus. The Argives were aſſiſted by the Corinthians, the people of Meſſenia, Arcadia, and Megara. The Thebans had engaged all their neighbours in their quarrel, as in one common cauſe, and the two hoſtile armies met and engaged on the banks of the Gliſſas. The fight was obſtinate and bloody, but victory

J.Lizars sculp.t

The Epidendrum tessellatum; three Species of Dayfly, & the small Erodius from the East-Indies.

London Published as the Act directs Aug.t 1.1804 by J. Wilkes.

victory declared for the Epigoni, and some of the Thebans fled to Illyricum with Leodamas their general, while others retired into Thebes, where they were soon besieged, and forced to surrender. In this war Ægialeus alone was killed, and his father Adrastus was the only person who escaped alive in the first war. This whole war, as Pausanias observes, was written in verse; and Callinus, who quotes some of the verses, ascribes them to Homer, which opinion has been adopted by many writers. For my part, continues the geographer, I own that next to the Iliad and Odyssey of Homer, I have never seen a finer poem. *Apollodorus.* This name has been applied to the sons of those Macedonian veterans, who, in the age of Alexander, formed connections with the women of Asia.

EPIGO'NATIS, *s.* [Gr.] The pan of the knee.

E'PIGRAM, *s.* [*epigramma*, Lat.] A short poem terminating in a point.—A college of witcrackers cannot flout me out of my humour: do't thou think I care for a satire or an *epigram? Shakespeare.*

I writ
An *epigram* that boasts more truth than wit. *Gay.*

EPIGRAMMAT'IC, or EPIGRAMMATICAL, *adj.* [*epigrammaticus*, Lat.] Dealing in epigrams; writing epigrams.—Our good *epigrammatical* poet, old Godfrey of Winchester, thinketh no ominous forespeaking to lie in names. *Camden.*—Suitable to epigrams; belonging to epigrams.—He is every where above conceits of *epigrammatick* wit and gross hyperboles: he maintains majesty in the midst of plainness; he shines, but glares not; and is stately, without ambition. *Addison.*

EPIGRAM'MATIST, *s.* One who writes or deals in epigrams.—Such a customer the *epigrammatist* Martial meets withall, one who, after he had walked through the fairest street twice or thrice, cheapening jewels, plate, rich hangings, came away with a wooden dish. *Peachum.*

EP'IGRAPH, *s.* [from επι, upon, and γραφη, Gr. writing.] An inscription on a building, pointing out the time when, the persons by whom, the uses, &c. for which it was erected.

EPIGRY'PHUS, *s.* [from επι, and γρυψ, Gr. a hawk.] Having a nose like the beak of a hawk, commonly called a Roman nose. This was the distinguishing characteristic of the Egyptian god Osiris. See EGYPT, in this volume.

EPI'LA, a town of Spain, in the province of Aragon, on the Xiloca: seventeen miles west of Saragossa.

EPILAMP'SIS, *s.* [from επιλαμπω, Gr. to shine.] The sparkling and shining lights which seem to appear before the eyes of epileptic persons.

EP'ILEPSY, *s.* [from επιλαμβανω, Gr. to seize upon.] A convulsion, or convulsive motion of the whole body, or some of its parts, with a loss of sense. A convulsive motion happens when the blood, or nervous fluid, runs into any part with so great violence, that the mind cannot restrain them. See the article MEDICINE.—Melancholy distempers are deduced from spirits drawn from that cachochymia, the phrenitis from cholerick spirits, and the *epilepsy* from fumes. *Floyer.*

EPILEP'TIC, *adj.* Convulsed; diseased with an epilepsy.—*Epileptick*s ought to breath a pure air, unaffected with any steams, even such as are very fragant. *Arbuthnot.*

EPILEP'TICS, *s.* [*epileptica*, Lat. from επιληψια, Gr. the epilepsy.] Medicines which cure or relieve an epilepsy.

EPILO'BIUM, *s.* [επι λοβου ιον, Gr. "a violet upon a pod;" a rare instance of the name expressing an essential character of the plant.] In botany; the WILLOW-HERB; a genus of the class octandria, order monogynia, natural order of calycanthemæ. The generic characters are—Calyx: perianthium one leafed, four-parted, superior; divisions oblong, acuminate, coloured, deciduous. Corolla: petals four, roundish, outwardly wider, emarginate, expanding, inserted into the divisions of the calyx. Stamina: filaments eight, subulate, the alternate ones shorter; anthers oval, compressed, obtuse. Pistillum: germ cylindric, extremely long, inferior; style filiform; stigma four-cleft, thick, obtuse, rolled back. Pericarium: capsule extremely long, cylindric, streaked, four-celled, four-valved. Seeds: numerous, oblong, crowned with down; receptacle extremely long, four-cornered, free, flexile, coloured.—*Essential Character.* Calyx four-cleft; petals four; capsule, oblong, inferior; seeds, downy.

Species. 1. Stamens bent down. 1. Epilobium angustifolium, or narrow-leaved or rosebay willow-herb: leaves scattered, linear-lanceolate, quite entire, veined, flowers unequal. These plants are hardy perennials, not void of beauty; they are, however, commonly considered only as weeds, and accordingly are seldom cultivated in gardens, except the present species, which has an upright stem, from three to six feet high, branched at top, round, and pubescent; branches alternate; leaves alternate, running slightly down the stem, smooth, the edge minutely and rarely indented, the midrib whitish, the lateral nerves are nearly at right angles with this, and the leaves at their first appearance are rolled in at the edge; flowers purple, showy, growing in a kind of long spike, on purple peduncles, the length of the germ, bending down before the flowers open, but afterwards erect, seldom more than four or five blown together on the same spike. There is a variety of this with white flowers. From the similitude of the leaves to those of willow, this plant obtained the name of willow-herb or French willow. It was formerly much planted in gardens; but, as it overruns all the neighbouring plants by means of its creeping roots, it has generally been cast out: however, in low moist places, or in great shade, this plant will make a good appearance when it is in flower, which will be near a month, if the season be not very hot. It is native of most parts of Europe from Lapland to Italy. In Britain it is not common; on Maizehill, beyond Greenwich, and other places near London, it has probably got out of gardens; but in other places it is undoubtedly wild, as near Alton in Hampshire; in Charlton forest, and several other woods in Sussex, where Mr. Miller found it in great plenty, far from any habitations; about Berkhampstead, in Hertfordshire; in several parts of Yorkshire; and many places in Scotland. The young shoots are said to be eatable, although an infusion of the plant stupifies: the pith, when dried, is boiled, and becoming sweet, is by a proper process made into ale, and this into vinegar by the Kamtschatdales; it is also added to the cow-parsnip, to enrich the spirit that is prepared from that plant; as fodder, goats are said to be extremely fond of it, and cows and sheep to eat it; the down of the seeds mixed with cotton or fur has been manufactured into stockings and other articles of clothing.

2. Epilobium angustissimum, or linear-leaved willow-herb: leaves scattered, linear, obscurely toothletted, veinless; petals equal, quite entire. This species has been confounded with the foregoing. Professor de Saussure says it differs in its woody stem, its very narrow leaves with salient glands on their edges, the much more lively colour of the flower, shorter siliques, and the air entirely different. Haller adds, that the stem is only a foot or eighteen inches in height with a branch from almost every axil; the flowers almost the same with the foregoing, but the leaves totally different. M. Villars says, that the flowers do not come in a spike, like those of the preceding, but terminate the stem, and are fewer in number. It is an alpine plant, but is common low down in the beds of the alpine torrents; as in the Vevaise, and the Grande Eau near Aigle; found also in Provence, Dauphiné, Savoy, &c. and flowers in July and August.

3. Epilobium latifolium, or broad-leaved willow-herb: leaves alternate, lanceolate-ovate; flowers unequal. This differs from the first species in having flowers twice the size; the leaves broader, regularly alternate, not scattered, very smoothly tomentose on both sides. The stem is round, eighteen inches to upwards of two feet in height, and erect. Both this and the first differ from the following species in having unequal corollas with entire petals; the stamens converging at the base to the style; the pistil

bent

bent down; the leaves not oppoſite, and when they firſt break forth rolled back. Native of Denmark, Sileſia, and Siberia.

11. Stamens upright, regular; petals biſid. 4. Epilobium hirſutum, or large-flowered willow-herb: leaves ovate-lanceolate, half-ſtem-claſping hirſute; ſtem branching very much; root creeping. Stem from three to ſix feet high, upright, very much branched, cylindric, ſomewhat quadrangular at bottom, hirſute and purpliſh: with ſoft ſpreading hairs, flatted at the inſertion of the branches; which are like the ſtem, nearly upright, the upper generally ſolitary alternate; flowers, large, ſhowy, purple or fleſh-coloured, ſomewhat bell-ſhaped, and hanging down a little, on peduncles, ſolitary, alternate. Native of moſt parts of Europe, by the ſides of ditches, ponds, lakes and rivers; flowering in July and Auguſt. The leaves, and particularly the top ſhoots when ſlightly bruiſed, have a delicate cool fragance, reſembling ſcalded codlings, whence its name of *codlings and cream*; this fragrance is very ſoon loſt after the plant is gathered. It is alſo called *great hairy codded looſe-ſtrife*. Horſes, ſheep, and goats, eat it; and, if it were found to be an acceptable fodder, it might be cultivated to advantage in wet ſituations. It varies with white flowers, and alſo with variegated leaves, in which ſtate it is ſometimes ſold by the gardeners; but having a creeping root, it is apt to increaſe too much.

5. Epilobium villoſum, or hoary willow-herb: leaves oblong-lanceolate, toothed, pubeſcent; ſtem columnar villoſe. This invariably differs from the foregoing in its corolla, root, and pubeſcence. The corolla is in general not more than one-third of the ſize; the root does not creep; and both ſtem and leaves are covered with numerous ſoft hairs, which give the whole plant a hoary appearance. The plant is alſo much ſmaller, and in general not ſo much branched: the leaves ſeſſile but not decurrent, the ſerratures few and diſtant: the calyx is alſo very different; and the ſegments of the ſtigma are ſcarcely rolled back. It grows in the ſame places, and flowers at the ſame time, with the foregoing.

6. Epilobium montanum, monntain or wood willow-herb: leaves oppoſite, ovate, toothed. The root has, on its upper part, little buds of a light red colour. Stem from one to three feet high, upright, red, cylindric, ſcarce perceptibly downy, ſometimes branched at top, but often ſingle. Native of Europe, in woods and hedges; ſometimes in moiſt meadows, but more frequently in dry gravelly ſoils, in courts, neglected walks, and on walls; on old trees, eſpecially willows. It flowers from June to Auguſt. Mr. Hudſon, marks it as biennial, and indeed it has not the appearance of being perennial, like moſt of the others.—This, like moſt of the reſt, varies with a white corolla, as alſo with three or four leaves at each joint.

7. Epilobium tetragonum, or ſquare-ſtalked willow-herb: leaves lanceolate, toothletted, the bottom ones oppoſite; ſtem four-cornered. One of the moſt ſtriking characters of this is the apparent ſquareneſs of the ſtalk, which ariſes from projecting lines running from the leaves down it: to this we may add the narrowneſs of its leaves; the uncommon length of its pods, and its undivided ſtigma, a character firſt noticed by Ray. The lower leaves are lanceolate, the upper ones narrower, all ſerrate and ſmooth; flowers ſmall, purple. Native of Europe, the Eaſt Indies, China and Cochinchina; with us not uncommon, generally met with in marſhes, and by the ſides of rivulets and ditches; as in the lane from Newington to Hornſey-wood; near Bungay in Suffolk; Alconbury in Huntingdonſhire, &c. flowering in July and Auguſt.

8. Epilobium paluſtre, or marſh willow-herb: leaves oppoſite, lanceolate, quite entire; petals emarginate; ſtem erect. Stem cylindric, upright, ſmooth, or pubeſcent, a foot high; but Villars deſcribes it as being lower than any of the preceding, and only half a foot high; the leaves narrow, almoſt linear, moſtly alternate, obtuſe and wider at the baſe; the flowers ſmall, pale red, emarginate. He ſays, that there are intermediate ſpecimens which ſo bring together this and E. montanum and tetragonum, that it is difficult to diſtinguiſh them; that this, however, is marked by the form of its leaves, the branches being approximating, and by its truncate root full of fibres: he adds, it is clear that this is not Chamænerion paluſtre of Scopoli, becauſe the petals are entire; and he is of opinion that Scopoli has given this name to the ſecond ſpecies. Native of Europe, on marſhes, bogs, and by the ſides of lakes.

9. Epilobium alpinum, or alpine willow-herb: leaves oppoſite, ovate-lanceolate, quite entire, ſiliques ſeſſile, ſtem creeping. This is a creeping plant, flowering early in the ſpring with ſeſſile germs: it is three or four inches, or hardly a ſpan high, decumbent at bottom, then upright, and bears one or two flowers at the top. Native of the mountains of Lapland, Denmark, Swiſſerland, Sileſia, Savoy, Dauphiné, Britain; as on Cheviott hills, near Settle, about Buckbarrow-well, and in many parts of Scotland, by the ſides of rivulets, and in ſandy places.

10. Epilobium fruticoſum, or ſhrubby willow-herb: ſtem ſhrubby very much branched, leaves quite entire, alternate, hirſute. Stem ſtraight, round, ſix feet high, with aſcending branches. This is a native of Cochinchina.

11. Epilobium glabellum, or ſmooth willow-herb: leaves oblong, toothed, obtuſe, the bottom ones oppoſite; ſtem roundiſh, erect. 12. Epilobium rotundifolium, or round-leaved willow-herb: leaves oppoſite, roundiſh, toothletted. Natives of New Zealand.

13. Epilobium parviflorum, or ſmall-flowered willow-herb: leaves oppoſite, lanceolate, ſerrate ſeſſile, both they and the ſtem villoſe. Native of Germany.

14. Epilobium alſinefolium, or chick-weed leaved willow herb: ſtem creeping; leaves ovate, acute, toothed; ſiliques the length of the ſtem. This is very nearly allied to E. alpinum in its ſize, habit, diſpoſition of the leaves, flowers, and ſiliques: their ſtems at bottom decumbent are thence aſcending; they are ſimple, and commonly two or three inches high; the leaves are oppoſite; thoſe of E. alpinum are elliptic, obtuſe, very ſeldom toothed, the upper ones are narrower and alternate; both upper and lower are of a bright green: the leaves of this are wider, oval, ſharp, always toothed, and of a duſky green inclining to black; the flowers are bright red, a little emarginate, middle-ſized; the ſiliques are few, ſmall, at an obtuſe angle in the firſt; ſquare, very long, and ſtraight in the ſecond. They both grow on the ſummits of the higheſt mountains, near the ſnow, where the ſiliques are often as long as the ſtem. It is poſſible that they may be only varieties of E. montanum and tetragonum.

Propagation and Culture. Theſe plants propagate ſpontaneouſly, both by ſeeds and runners; and require to be reſtrained rather than increaſed by the hand of art. They may, however, be admitted to advantage in remote ſhady corners, or on rock-work. They require no culture, except ſuch as is neceſſary to keep them within bounds.

EP'ILOGUE, *ſ.* [*epilogus*, Lat.] The poem or ſpeech uſually delivered at the end of a play.—If it be true that good wine needs no buſh, 'tis true that a good play needs no *epilogue*; yet to good wine they do uſe good buſhes, and good plays prove the better by the help of good *epilogues*. *Shakeſpeare.*

To EPI'LOGUIZE, *v. n.* To ſpeak ſomething by way of epilogue.—The dances ended, the ſpirit *epiloguizes*. *Stage-direction in Milton's Comus.*

EPILOI'MICA, *ſ.* [from επι, upon, and λοιμος, Gr. the plague.] Medicines good for the plague.

EPIME'DIUM, *ſ.* [ſo called by Pliny and Dioſcorides, from επι and μηδιον, Gr. being larger than another plant named *medium*: this derivation is very unſatisfactory, but we have not a better to ſubſtitute.] BARRENWORT; in botany, a genus of the claſs tetrandria, order monogynia, natural order of corydales, (berberides, *Juſſ.*) The generic characters are—Calyx: perianthium four-leaved; leaflets ovate, obtuſe, concave, expanding, ſmall, placed directly

directly (not alternately) below the petals, caducous, (with a ſingle bracte at the baſe of two of them, *J.*) Corolla: petals four, ovate, obtuſe, concave, expanding; nectaries four, cup-form, (ſlipper-form, *J.*) with obtuſe bottoms, of the ſize of the petals, and leaning on them, affixed by the edge of the mouth to the receptacle. Stamina: filaments four, ſubulate, preſſing on the ſtyle; antheræ oblong, erect, two-celled, two-valved, gaping from the baſe towards the tip, with a free diſſepiment. Piſtillum: germ oblong; ſtyle ſhorter than the germ, length of the ſtamens; ſtigma ſimple. Pericarpium: ſilique oblong, acuminate, one-celled, two-valved. Seeds: very many, oblong.—*Eſſential Character.* Nectaries four, cup-form, leaning on the petals; corolla four-petalled; calyx very caducous; fruit a ſilique.

Epimedium alpinum, or alpine barrenwort, a ſingle ſpecies. This plant has a creeping root, from which ariſe many ſtiff ſmooth ſtalks about nine inches high. It is a native of the Alps and Apennines; flowering in April and May, and longer in ſhady places; alſo in Japan. Mr. Miller affirms that he received ſome plants of it, which were found growing naturally in a wood in the north of England: but he was probably miſinformed. "This rare and ſtrange plant, (ſays Gerarde,) was ſent to me from the French king's herbariſt, Robinus, dwelling in Paris, at the ſign of the Black Head, in the ſtreet called *Du Bout du Monde.* I planted it in my garden, but it was dried away with the extreme heat of the ſun, which happened in the year 1590, ſince which time it bringeth ſeed to perfection." Johnſon (Ger. emac.) adds, that it grew in the garden of his friend, Mr. John Milion, in Old-ſtreet, and ſome other gardens about town.

Propagation and Culture. It may be increaſed by the roots, and ſucceeds beſt in the ſhade, where it muſt every year be reduced, otherwiſe it will ſpread its roots, ſo as to interfere with the neighbouring plants. It deſerves a place in gardens, though not ſhowy, for its beauty and ſingularity.

EPIME'NIA, *ſ.* A law term: gifts, expences.

EPIMEN'IDES, an epic poet of Crete, contemporary with Solon. His father's name was Agiaſarchus. He is reckoned one of the ſeven wiſe men, by thoſe who exclude Periander from the number. While he was tending his flocks, he entered into a cave, where he fell aſleep. His ſleep continued for fifty-ſeven years, according to legendary tradition, and when he awoke, he found every object ſo conſiderably altered, that he ſcarcely knew where he was. His brother apprized him of the length of his ſleep to his great aſtoniſhment. It is ſuppoſed that he lived 289 years. After death he was revered as a god, and greatly honoured by the Athenians, whom he had delivered from a plague, and to whom he had given many good and uſeful counſels. He is ſaid to be the firſt who built temples in the Grecian communities. *Strabo.*

EPIME'THEUS, in fabulous hiſtory, a ſon of Japetus and Clymene, one of the Oceanides, who inconſiderately married Pandora, by whom he had Pyrrha, the wife of Deucalion. He had the curioſity to open the box which Pandora had brought with her, and from thence iſſued a train of evils, which from that moment have never ceaſed to afflict the human race. Hope was the only one which remained at the bottom of the box, not having ſufficient time to eſcape, and it is ſhe alone which comforts men under misfortunes. Epimetheus was changed into a monkey by the gods, and ſent into the iſland of Pithecuſa. *Heſiod.*

EPIM'YLIS, *ſ.* [from επι, and μυλη, Gr. the knee.] The patella, or knee-pan.

EP'INAL, a city of France, and capital of the department of the Voſges, on the Moſelle; formerly belonging to the duchy of Lorrain, and taken by the troops of Louis XIV. under the command of mareſchal Crequi, and ſoon after diſmantled: forty-eight poſts and three quarters eaſt-ſouth-eaſt of Paris. Lat. 48. 10. N. lon. 24. 7. E. Ferro.

EP'INAY, a town of France: two leagues north of Paris.

EPINE'PHELUS, *ſ.* the Wall-eye; a new genus of fiſhes in Bloch's ſyſtem, the ſpecies of which are included under Holocentrus.

EP'INEU-LE-CHEVREUIL, a town of France, in the department of the Sarte, and chief place of a canton, in the diſtrict of Sillé: twelve miles weſt of Le Mans.

EPINEU'L, a town of France, in the department of the Yonne, and chief place of a canton, in the diſtrict of Tonnere: one mile and a half north of Tonnere.

EPINI'CION, *ſ.* [Gr.] A triumphal ſong.—A dancing maſk of ſix enters, then the *epinicion* is ſung by two bards. *Stage-direction in Fuimus Troes.*

EPINO'I, a town of France, in the department of the North: ſeven miles ſouth of Lille.

EPIPAC'TIS. See Astrantia, Ophrys, Orchis, Satyrium, and Serapias.

EPIPAS'TUM, *ſ.* [from επι, upon, and πασσω, Gr. to ſprinkle.] A medicine reduced to powder, and ſprinkled over the body of a patient, or part affected.

EPIPEDO'METRY, *ſ.* [from επι upon, πους a foot, and μετρον, Gr. a meaſure.] The menſuration of figures that ſtand on the ſame baſe.

EP'IPHAN, a town of Ruſſia, in the government of Tula: forty miles eaſt of Tula.

EPIPHA'NEA, anciently a town of Cilicia, near Iſſus, now Surpendkar.—Another town of Syria, on the Euphrates.

EPIPH'ANES, a ſurname given to the Antiochus's, kings of Syria, ſignifying *illuſtrious.*—A ſurname of one of the Ptolemies, the fifth of the houſe of the Lagidæ.

EPIPHA'NIUS, biſhop of Salamis in the iſland of Cyprus, in the fourth century, and in the catholic calendar, dignified with the title of ſaint, was born at Bezanduce, a village in Paleſtine, about the year 320. Many of the particulars which are related by different writers concerning his extraction, his education, and the other circumſtances of his early life, are involved in much obſcurity, and ſome of them are evidently fabulous. From the moſt credible accounts of him it appears, that when he was but very young he went into Egypt, where he became intimate with ſome of the Gnoſtics, by whom he was almoſt perſuaded to embrace their opinions: but he ſoon broke off his connection with them, and became a diſciple of the Egyptian Aſcetics. In the twentieth year of his age, he returned to his native country, and placed himſelf under the diſcipline of Hilarion. After remaining for ſome time under his inſtructions, Epiphanius founded a monaſtery near the village in which he was born, over which he himſelf preſided during the remainder of his life. In 368 he was choſen biſhop of Salamis, afterwards called Conſtantia, the metropolis of the iſland of Cyprus, where he acquired a high reputation for piety and ſanctity of manners, and zealouſly employed himſelf in writing defences of the orthodox doctrines againſt the attacks of contemporary heretics. His zeal, however, was more conſpicuous in his polemical productions, than the accuracy of his judgment, or the ſolidity of his reaſoning; and it was the occaſion of his being involved in many unpleaſant diſputes, which embittered a conſiderable portion of his life. He was unqueſtionably a very pious and religious character; but his mind was unfortunately tinctured by a gloomy ſuperſtition, which led him to conſider the auſtere diſcipline of the cloiſter to be the moſt acceptable ſervice in the ſight of heaven. Hence he was led to practiſe it in all its rigour, after he was advanced to the epiſcopal ſtation, and to fill the countries where his influence extended with monaſtic inſtitutions. He is ſaid to have been ſo humane and charitable, that he expended not only his own private fortune, but the greateſt part of the revenues of his church, and vaſt ſums that were entruſted to his diſpoſal, in relieving the poor and unfortunate. Epiphanius was ſkilled in the Hebrew, Syriac, Egyptian, Greek, and Latin, languages,

whence he was called by St. Jerom πεδιαγλαπτος; and his reading was very extenſive, particularly in eccleſiaſtical antiquities. He was, however, greatly deficient in judgment, and cannot be commended for his ſkill in wielding the weapons of controverſy. Beſides being inaccurate in the numerous tranſcripts from ancient authors now nowhere elſe to be found, of which a conſiderable part of his works conſiſts, he has ſhewn himſelf exceſſively credulous in admitting ſtatements and reports without any enquiry into their evidence; by which means he has betrayed himſelf into a variety of contradictions and abſurdities, which eſſentially affect the value of his labours as works of reference and authority. His ſtyle, far from having any pretenſions to Attic elegance, is mean, harſh, and unpoliſhed, without perſpicuity, and without connection. The works of Epiphanius were firſt printed in Greek at Baſil, by Oporinus, in 1544; ſince which time they have undergone various impreſſions, of which the moſt valuable is that publiſhed at Paris in 1622, in two volumes folio, by the learned Petavius. This edition was afterwards reprinted at Cologne in 1682, in two volumes folio.

EPIPHA'NIUS, ſurnamed THE SCHOLASTIC, an Italian by birth, and an able Greek and Latin ſcholar, flouriſhed about the year 510. He was the friend of the celebrated Caſſiodorus, at whoſe requeſt he tranſlated into the Latin language the eccleſiaſtical hiſtories of Socrates, Sozomen, and Theodoret; which verſion is more to be commended for its fidelity than its elegance, ſince it is marked by numerous barbariſms of the age in which the author wrote. Epiphanius was alſo the author of ſeveral other tranſlations from the Greek into Latin, which are no longer extant. To him Caſſiodorus was indebted for the improvement, at leaſt, of the verſion of the *Codex encyclicus*, or Collection of Synodal Letters of the year 458, addreſſed to the emperor Leo, in defence of the Council of Chalcedon. The beſt edition of that verſion is to be found in Baluzius's New Collection of the Councils, publiſhed at Paris in 1683, folio.

EPIPHA'NIUS, patriarch of Conſtantinople in the ſixth century. He was a ſtrenuous advocate for the orthodox doctrines in oppoſition to the tenets of the Eutychians; and, after his elevation to his high dignity in 520, he procured the condemnation of the latter in a ſynod of biſhops held at Conſtatinople. During his patriarchate, the decrees of the council of Chalcedon were confirmed, and the reconciliation was completed between the churches of Conſtantinople and Rome, after the firſt great ſchiſm which had laſted about thirty-five years. Five letters of his to pope Hormiſdas on the ſubject of the union, are extant in the fourth volume of the Collection of the Latin Councils.

EPIPH'ANY, *ſ.* [*epiphanie*, Fr. *epiphania*, Lat. επιφανεια, of επι, and φαινω, Gr. manifeſtation.] A Chriſtian feſtival, otherwiſe called the *Manifeſtation of Chriſt to the Gentiles*, obſerved on the ſixth of January, in honour of the appearance of the ſtar to the three magi or wiſe men, who came to adore the Meſſiah, and bring him preſents. It is commonly called *Twelfth-day*.

EPIPHONE'MA, *ſ.* [from επιφωνημα, Gr.] An exclamation; a concluſive ſentence not cloſely connected with the words foregoing.—If thoſe preachers who abound in *epiphonemas* would but look about them, they would find one part of their congregation out of countenance, and the other aſleep. *Swift.*

EPIPHLOGIS'MA, *ſ.* [from επι, upon, and φλογιζω, Gr. to inflame.] The medical term for the ſhingles.

EPIPH'ORA, *ſ.* [from επιφερω, Gr. to carry forcibly.] With phyſicians, an impetuous flux of humours to the ſurface of the body. It particularly means a flux of tears from the eyes, in conſequence of any diſeaſe of the part.

EPIPHYLLAN'THUS, in botany. See XYLOPHYLLA.

EPIPHYLLOSPER'MOUS, *adj.* [επι, upon, φυλλον, a leaf, σπερμα, Gr. ſeed.] In botany, it is applied to ſuch plants as have their ſeeds growing on the back of the leaves, as the ferns.

EPIPH'YSIS, *ſ.* [from επι, upon, and φυω, Gr. to grow.] A ſmall bone annexed to a larger by means of an intervening cartilage. See ANATOMY.

EPI'PLOCE, *ſ.* [from επιπλοκη, Gr.] A figure of rhetoric, by which one aggravation, or ſtriking circumſtance, is added in due gradation to another; as, *He not only ſpared his enemies, but continued them in employment; not only continued, but advanced them.*

EPI'PLOCELE, *ſ.* [from επιπλοον, the omentum, and κηλη, Gr. a tumour or rupture.] A rupture of the omentum.

EPIPLOOM'PHALON, *ſ.* [from επιπλοον, the omentum, and ομφαλος, Gr. the navel.] An umbilical hernia.

EPI'PLOON, *ſ.* [from επιπλεω, Gr. to lie upon.] The omentum or caul, which lies upon the ſurface of the bowels.

EPIPLOSCHEOCE'LE, *ſ.* [from επιπλοον, the omentum, οσχεον the ſcrotum, and κηλη, Gr. a tumour or hernia.] A rupture of the omentum into the ſcrotum.

EPIPO'GIUM, *ſ.* in botany. See SATYRIUM.

EPIP'OLÆ, a diſtrict of Syracuſe, on the north ſide, ſurrounded by a wall by Dionyſius, who, to complete the work expeditiouſly, employed 60,000 men upon it, ſo that in thirty days he finiſhed a wall four miles and three quarters long, and of great height and thickneſs.

EPIPO'LASIS, *ſ.* [from επιπολαζω, Gr. to ſwim on the top.] In medicine, a fluctuation of humours. In chemiſtry, it means the ſettlement of any matter ſublimed, and ſwimming on the top.

EPIPO'MA. *ſ.* [from επι, upon, and πωμα, Gr. a lid.] In ſurgery, an inſtrument to cover the ſhoulder in a luxation.

EPIPORO'MA, *ſ.* [from επιπωροω, Gr. to harden.] An indurated tumour in the joints.

EPIPTYX'IS, *ſ.* [from επιπτυσσω, Gr. to cloſe up.] A ſpaſmodic diſorder of the lips, ſo that they can hardly be opened.

EPI'RE, the ancient *Epirus*, now united with Albania, and included in that country, of which it forms the ſouthern part, extending from Valona to Arta.

EPI'RUS, a country of ancient Greece, bounded on the eaſt by Etolia, on the weſt by the Adriatic, on the north by Theſſaly and Macedon, and on the ſouth by the Ionian ſea. It was anciently governed by its own princes, in which ſtate it made a conſiderable figure. According to Joſephus, it was firſt peopled by Dodanim, the ſon of Javan, and grandſon of Japhet. The people were warlike, but continued in their ſavage ſtate long after their neighbours were civilized; whence the iſlanders uſed to threaten petty offenders with tranſportation to Epirus. The hiſtory of Epirus commences with the reign of Pyrrhus, ſon of Achilles by Deidamia the daughter of Lycomedes, king of Scyros. He is ſaid to have behaved with great bravery at the ſiege of Troy; but with no leſs barbarity. After the city was taken, he is ſaid to have killed old king Priam; to have thrown Aſtyanax, the ſon of Hector and Andromache, headlong from an high tower; and ſacrificed Polyxena, the daughter of Priam, on the tomb of his father. He carried Andromache with him into Epirus, where he ſettled by the advice of the famous ſoothſayer Helenus, one of Priam's ſons, who had ſerved during the Trojan war both under his father and himſelf. The moſt remarkable period of the hiſtory of Epirus is the reign of Pyrrhus II. who made war upon the Romans. He was invited into Italy by the Tarentines; and embarked about 280 years before Chriſt. After having eſcaped many dangers by ſea, he landed in that country, and with great difficulty gained a victory over the Romans; but was afterwards utterly defeated. To retrieve his credit, he undertook an expedition againſt Macedon; where he overthrew Antigonus, and made himſelf maſter of the whole kingdom. He then formed a deſign of ſubduing

during all the other Grecian ſtates; but met with ſuch an obſtinate reſiſtance at Lacedæmon, that he was obliged to drop the enterprize; and was ſoon after killed at the ſiege of Argos by a woman, who from the wall threw a tile upon his head. Deidamia, the grand-daughter of Pyrrhus, was the laſt that ſat on the throne of Epirus. She is ſaid to have been murdered after a ſhort reign; upon which the Epirots formed themſelves into a republic.

Under the new form of government Epirus never made any conſiderable figure, but became dependent on the kingdom of Macedon. The Romans, after conquering king Philip, reſtored the Epirots to their ancient liberty; but they, forgetful of this favour, took up arms in behalf of Perſeus. As a puniſhment for their ingratitude, the Romans gave orders to Paulus Emilius to plunder the cities of Epirus, and level them with the ground. Upwards of ſeventy cities were diſmantled, and the chief men of the country carried to Rome, where moſt of them were condemned to perpetual impriſonment. This terrible blow Epirus never recovered. Upon the diſſolution of the Achæan league, it was made part of the province of Macedon; but when Macedon became a dioceſe, Epirus was again ſeparated from it, and called the province of *Old Epirus*, to diſtinguiſh it from *New Epirus*, another province on the eaſt of it. On this diviſion it fell to the emperors of the eaſt, and continued under them till the taking of Conſtantinople by the Latins, when Michael Angelus, a prince nearly related to the Greek emperor, ſeized on Etolia and Epirus, of which he declared himſelf prince; and was ſucceeded by his brother Theodorus, who took ſeveral towns from the Latins, and ſo far enlarged his dominions, that he aſſumed the title of emperor, and was crowned by Demetrius archbiſhop of Bulgaria. Charles, the laſt prince of this family, dying without lawful iſſue, bequeathed Epirus and Acarnania to his natural ſons, who were driven out by Amurath II. Great part of Epirus was afterwards held by the noble family of the Caſtriots, who ſtyled themſelves princes of Epirus. Upon the death of the famous George Caſtriot, ſurnamed *Scanderbeg*, Epirus fell to the Venetians, from whom it was taken by the Turks; in whoſe hands it ſtill continues, and is now known by the name of *Albania*.

EPIS'COPACY, *ſ.* [from the Latin *epiſcopatus*, which is derived from the Greek επισκοπος.] In its primary ſenſe it means "The office of overlooking or overſeeing:" and thence, as applied by eccleſiaſtical writers, it is uſed to ſignify in a more peculiar manner "The office of a biſhop, who is to overlook and overſee the concerns of the church." The origin of this office is clearly traced back to the days of St. Paul: for that apoſtle left Timothy at Epheſus, and Titus at Crete, for the expreſs purpoſe of exerciſing it. The acts, by which theſe two perſons ſhared a degree of pre-eminence over others in the church, were the appointment of preſbyters and deacons by ordination, and the correction of miſconduct in preſbyters and deacons by reproof. However therefore the Scriptures may want a Greek word to expreſs epiſcopacy, the office, with the powers now deemed epiſcopal, did virtually exiſt in the earlieſt age of Chriſtianity. That it prevailed univerſally, wherever a church was planted, is not ſo clear. But that in the ſecond century this office became more general, with the view of preſerving peace and ſubordination among the preſbyters, is very certain. From that period for ſeveral hundred ſucceſſive years, the church government was epiſcopal; that is, under the direction of biſhops, prieſts, and deacons. Writers on the ſubject of epiſcopacy and preſbytery have been led into error, from not attending to this circumſtance; viz. that every biſhop was neceſſarily a preſbyter, but every preſbyter was not a biſhop. The qualification for epiſcopacy was the being a preſbyter: but it did not follow that becauſe a perſon was a preſbyter he ſhould therefore be a biſhop. The epiſcopacy ſoon became to be conſidered ſo ſuperior to preſbytery, that a diſtinct form of prayer and appropriate ſolemnities were appointed to be uſed, when a preſbyter was advanced to epiſcopacy.

EPIS'COPAL, *adj.* [from *epiſcopus*, Lat.] Belonging to a biſhop.—The plot of diſcipline ſought to erect a popular authority of elders, and to take away *epiſcopal* juriſdiction. *Hooker.*—Veſted in a biſhop.—The apoſtle commands Titus not only to be a pattern of good works himſelf, but to uſe his *epiſcopal* authority in exhorting every rank and order of men. *Rogers.*

EPISCOPA'LIA, *ſ.* Synodals, or other cuſtomary payments from the clergy to their biſhop or dioceſan; which were formerly collected by the rural deans, and by them tranſmitted to the biſhop. Theſe cuſtomary payments have been otherwiſe called *onus epiſcopale*; and were remitted by ſpecial privilege to free churches and chapels of the king's foundation, which were exempt from epiſcopal juriſdiction.

EPISCOPA'LIANS, *ſ.* An appellation given to thoſe who prefer the epiſcopal government and diſcipline to all others. By the teſt act, none but epiſcopalians, or members of the church of England, are qualified to enjoy any office civil or military.

EPIS'COPATE, *ſ.* [*epiſcopatus*, Lat.] A biſhopric; the office and dignity of a biſhop.

EPISCO'PIA, a town of Italy, in the kingdom of Naples, and province of Baſilicata: nineteen miles ſouth-weſt of Turſi.

EPISCO'PIUS (Simon), a learned Dutch divine of the ſeventeenth century, born at Amſterdam in 1583. After paſſing through a courſe of claſſical education in his native city, he entered upon academic ſtudies at the univerſity of Leyden, where he took his degree of M.A. in 1606. In 1612 he was choſen profeſſor of divinity at Leyden, in the room of Gomarus. To the duties of this office, and the private ſtudies neceſſary to the honourable diſcharge of them, he applied himſelf with the greateſt aſſiduity, and became one of the greateſt ornaments and ableſt defenders of the Arminian ſect. His works, conſiſting of commentaries, theological inſtitutions, controverſial treatiſes, &c. form two volumes in folio; the firſt of which contains ſuch pieces as were publiſhed during the author's life-time, and appeared in 1650, and the ſecond his poſthumous productions, which were firſt given to the public in 1665. They were edited by Stephen Curcellæus, who has prefixed to them an account of the author. A larger Life of him was publiſhed by Philip à Limborch, the ſon of his brother's daughter, written in the Dutch language, of which a Latin verſion appeared at Amſterdam in 1701, 8vo.

EPISPHÆ'RIA, *ſ.* [from επι, upon, and σφαιρα, Gr. a ſphere.] The windings of the exterior ſurface of the brain, and veſſels upon it: ſo called from the ſphærical ſhape of the brain.

EP'ISODE, *ſ.* [Gr.] An incidental narrative, or digreſſion in a poem, ſeparable from the main ſubject, yet riſing naturally from it.—The poem hath no other *epiſodes* than ſuch as naturally ariſe from the ſubject. *Addiſon.*

EPISO'DIC, or EPISODICAL, *adj.* Contained in an epiſode; pertaining to an epiſode.—*Epiſodical* ornaments, ſuch as deſcriptions and narrations, were delivered to us from the obſervations of Ariſtotle. *Dryden.*—I diſcover the difference between the *epiſodic* and principal actions, as well as the nature of epiſodes. *Notes on the Odyſſey.*

EPISPAS'TIC, *ſ.* [from επι and σπαω, Gr.] Drawing. Bliſtering; this is now the more frequent, though leſs proper ſenſe.—This matter ought to be ſolicited to the lower parts, by fomentations, bathing, *epiſpaſtics*, and bliſtering. *Arbuthnot.*

EPIS'TASIS, *ſ.* [from επι, and ιστημι, Gr. to ſtay.] A ſuppreſſion or retention of any of the excretions. Alſo the ſubſtance on the ſurface of the urine, from επιστημι, to ſtand upon.

EPISTAX'IS, *ſ.* [from επισταζω, Gr. to diſtil from.] A violent bleeding of the noſe.

EPIS'TLE, *ſ.* [from επιστολη, Gr.] A letter. This word is ſeldom uſed but in poetry, or on occaſions of dignity and ſolemnity:

When looſe *epiſtles* violate chaſte eyes,
She half conſents, who ſilently denies. *Dryden.*

EPISTLES and GOSPELS, in the liturgy of the church of England, are ſelect portions of ſcripture, taken out of the writings of the evangeliſts and apoſtles, and appointed to be read, in the communion-ſervice, on Sundays and holidays. They are thought to have been ſelected by St. Jerom, and by him put into the lectionary. It is certain, they were very anciently appropriated to the days whereon we now read them, ſince they are not only of general uſe throughout the weſtern church, but are alſo commented upon in the homilies of ſeveral ancient fathers, which are ſaid to have been preached upon thoſe very days to which theſe portions of ſcripture are now affixed. The epiſtles and goſpels are placed in an admirable order and method, and bear a ſpecial relation to the ſeveral days whereon they are read. The year is diſtinguiſhed into two parts; the firſt being deſigned to commemorate Chriſt's living among us, the other to inſtruct us to live after his example. The former takes in the whole time from Advent to Trinity-Sunday; the latter, all the Sundays from Trinity to Advent. During the firſt of theſe ſeaſons, the epiſtles and goſpels are calculated to raiſe in us a grateful ſenſe of what our Saviour ſuffered for us, and ſet before our eyes his nativity, circumciſion, and manifeſtation to the Gentiles; his doctrines and miracles; his baptiſm, faſting, and temptation; his agony and bloody ſweat; his croſs and paſſion; his death, burial, reſurrection, and aſcenſion; and the miſſion of the Holy Ghoſt. During the ſecond ſeaſon of the year, the epiſtles and goſpels tend to inſtruct us in the true paths of Chriſtianity.

EPIST'LER, *ſ.* A ſcribbler of letters.

EPIS'TOLARY, *adj.* Relating to letters; ſuitable to letters. Tranſacted by letters.—I ſhall carry on an *epiſtolary* correſpondence between the two heads. *Addiſon.*

EPISTOLOGRA'PHIC, *adj.* [from επιστολη, an epiſtle, and γραφω, Gr. to write.] Belonging to the writing of letters; writing letters.

EPISTO'MIA, *ſ.* [from επι, upon, and στομα, Gr. a mouth.] In anatomy, the opening of one veſſel into another; the junction or meeting of the veſſels.

EPISTO'MIUM, *ſ.* in hydraulics, a plug or inſtrument by which an aperture may be opened and ſhut at pleaſure.

EP'ISTYLE, *ſ.* in the ancient architecture, a term uſed by the Greeks for what we call *architrave*, viz. a maſſive ſtone, or a piece of wood, laid immediately over the capital of a column.

EP'ITAPH, *ſ.* [from *epitaphium*, Lat. επιταφιον, of επι τω ταφω, Gr. upon a tomb.] A monumental inſcription, in honour or memory of a perſon deceaſed:

Some thy lov'd duſt in Parian ſtones enſhrine,
Others immortal *epitaphs* deſign;
With wit and ſtrength, that only yields to thine. *Smith.*

The origin of epitaphs and monumental inſcriptions, ſeems to have proceeded from that ſtrong preſage or ſenſe of immortality, naturally implanted in the minds of men. Their invention is attributed to the fate of Lynus the Theban poet, who flouriſhed about the 2700th year of the world, and who being unhappily ſlain, his ſcholars lamented the loſs of their maſter in a particular kind of mournful verſes, called from him *Ælinium*, and afterwards *epitaphia*; becauſe they were ſung at burials, and engraved upon monuments *a memoria*, to put men in mind of the inſtability of human nature, as well as to reſpect and imitate the virtues of their departed friends.

EPIT'ASIS, *ſ.* [from επι and τεινω, Gr. to extend.] A term with phyſicians for the beginning and increaſe of a paroxyſm or diſeaſe.—In dramatic poetry, it is the ſecond and buſieſt part of a comedy, wherein the plot thickens, and is, as it were, brought to its height.

EPITHALA'MIUM, *ſ.* [Lat. *epithalame*, Fr. *epitolamio*, Ital. επιθαλαμιον, of επι, and θαλαμος, Gr. a bed.] A nuptial ſong; a compliment upon marriage.—Epithalamia were ſung amongſt the Jews, at the door of the bride, by her friends and companions, the evening before the marriage. Pſalm xlv. is an epithalamium. Among the Greeks, the epithalamium was ſung as ſoon as the married couple were gone to bed, and attended with ſhouts, and ſtamping of the feet; a practice as coarſe as that of "throwing the ſtocking," amongſt the vulgar in England, Scotland, and Ireland; to which it probably gave riſe.

EP'ITHEM, *ſ.* [from επιθεμα, Gr.] A liquid medicament externally applied.—Cordials and *epithems* are neceſſary, to reſiſt the putrefaction and ſtrengthen the vitals. *Wiſeman.*

EPI'THESIS, *ſ.* [from επι, and τιθημι, Gr. to cover or lay upon.] In ſurgery, the rectification of crooked limbs by means of inſtruments.

EP'ITHET, *ſ.* [*epitheton*, Lat. επιθετον, Gr. a thing added to.] An adjective denoting any quality good or bad: as, the *verdant* grove, the *craggy* mountain's *lofty* head.—I affirm with phlegm, leaving the *epithets* of falſe, ſcandalous, and villainous, to the author. *Swift.*—It is uſed by ſome writers improperly for title, name.—The *epithet* of ſhades belonged more properly to the darkneſs than the refreſhment. *Decay of Piety.*—It is uſed improperly for phraſe, expreſſion.—For which of my good parts did you firſt ſuffer love for me.——Suffer love! a good *epithet*: I do ſuffer love indeed: for I love thee againſt my will. *Shakeſpeare.*

EPI'THETON, *ſ.* The Greek original of epithet, put by *Shakeſpeare* into the mouth of Armado.—I ſpoke it, tender Juvenal, as a congruent *epitheton*. *Love's Labour loſt.*

EPI'THYMUM, *ſ.* in botany. See CUSCUTA.

EPITO'GIUM, *ſ.* [*not much uſed.*] A tabard, a looſe upper garment, a kind of hood worn by ſtudents after taking a degree in the univerſity. *Phillips.*

EPI'TOME, *ſ.* [from επιτεμνω, Gr. to retrench.] Abridgement; abbreviature; compendious abſtract; compendium.—*Epitomes* are helpful to the memory, and of good private uſe. *Wotton.*

To EPI'TOMISE, *v. a.* To abſtract; To contract into a narrow ſpace.—If the ladies take a liking to ſuch a diminutive race, we ſhall ſee mankind *epitomized*, and the whole ſpecies in miniature. *Addiſon.*—Leſs properly, to diminiſh by amputation; to curtail.—We have *epitomized* many particular words, to the detriment of our tongue. *Spectator.*

EPI'TOMISER or EPITOMIST, *ſ.* An abridger; an abſtracter; a writer of epitomes.

EPITO'NIUM, *ſ.* [from επι upon, and τεινω, Gr. to ſtretch.] An inſtrument to ſtretch cords, a peg in a muſical inſtrument, a device to force water up out of a well. *Phillips.*

EPI'TRITUS, *ſ.* [in poetry.] A foot conſiſting of four ſyllables, the firſt ſhort and the three following long.

EPITROCHAS'MUS, *ſ.* [from επι upon, and τροχαζω, Gr. to run.] A figure in rhetoric in which ſeveral things are run over in a hurry.

EPIT'ROPE, *ſ.* [from επι upon, and τρεπω, Gr. to turn.] A figure in rhetoric in which the orator advances what he might deny in order to obtain what he demands.

EPIT'ROPUS, *ſ.* [from επι upon, and τρεπω, Gr. to turn.] An arbitrator; one choſen by the Chriſtians in Turkey to decide their differences, and prevent the inconveniences of applying to the civil magiſtracy.

EPIT'YRUM, *ſ.* [with the ancients.] A kind of ſallad.

EPIZEUGME'NON, *ſ.* [in rhetoric.] The diezugmenon, a figure in which ſeveral ſubjects have reference to one verb.

EPIZEU'XIS, *ſ.* [from επι upon, and ζευγνυμι, Gr. to join.]

join.] The act of joining together; the ſtate of being joined together. In rhetoric, it is a repetition of the ſame word in the ſame ſentence or verſe, no other word coming between.

EPNEUMA'TOSIS, *ſ.* [from επι upon, and πνευμα, Gr. the breath.] The act or power of breathing out.

E'POCH, or EPOCHA, *ſ.* [*epocha*, Lat. εποχη, of επι, upon, and εχω, Gr. to hold.] In chronology, the time at which a new computation is begun; the time from which dates are numbered.—Moſes diſtinctly computes by certain intervals, memorable æras and *epochas*, or terms of time. *Brown.*—Time is always reckoned from ſome known parts of this ſenſible world, and from ſome certain *epochs* marked out to us by the motions obſervable in it. *Locke.*

Time by neceſſity compell'd, ſhall go
Through ſcenes of war, and *epochas* of woe. *Prior.*

Different nations make uſe of different epochs. The Chriſtians chiefly uſe the epoch of the nativity or incarnation of Jeſus Chriſt; the Mahometans, that of the Hegira; the Jews, that of the creation of the world, or that of the Deluge; the ancient Greeks, that of the Olympiads; the Romans, that of the building of their city; the ancient Perſians and Aſſyrians, that of Nabonaſſar; &c. The doctrine and uſe of epochs is of very great extent in chronology. To reduce the years of one epoch to thoſe of another, is to find what year of one correſponds to a given year of another; a period of years has been invented, which, commencing before all the known epochs, is, as it were, a common receptacle of them all, called the Julian Period. To this period all the epochs are reduced; *i. e.* the year of this period when each epoch commences is determined. So that, adding the given year of one epoch to the year of the period correſponding with its riſe, and from the ſum ſubtracting the year of the ſame period correſponding to the other epoch, the remainder is the year of that other epoch.—See CHRONOLOGY, vol. iv. p. 537.

EP'ODE, *ſ.* [*epodus*, Lat. of επι, after, and ωδαι, Gr. ſongs.] One of the numbers of that ſort of lyric poetry, of which the odes of Pindar conſiſt.

EPOISS'E, a town of France, in the department of the Cote-d'Or, and chief place of a canton, in the diſtrict of Semur-en-Auxois: ſeven miles weſt Semur.

EP'OMIS, *ſ.* [of επι, and ωμος, Gr. a ſhoulder.] An hood, ſuch as univerſity ſtudents wear. It was alſo a part of the Jewiſh high-prieſt's veſture. See EPHOD.

EP'ONA, a beautiful girl, ſaid to have been the fruit of a man's union with a mare.

EPOPE'E, *ſ.* [Gr.] An epic or heroic poem.—Tragedy borrows from the *epopee*, and that which borrows is of leſs dignity, becauſe it has not of its own. *Dryden.*

EPO'PEUS, a ſon of Neptune and Canace, who came from Theſſaly to Sicyon, and carried away Antiope, daughter of Nycteus king of Thebes. This rape was followed by a war, in which Nycteus and Epopeus were both killed. *Apollodorus.*

EPOS'CHEUM, *ſ.* [from επι, upon, and οσχεον, Gr. a branch.] In botany, a tendril, or little ſpiral ramification, growing from the branches.

EP'PING, a neat and pleaſant town, in the county of Eſſex, with a market on Thurſdays for cattle, and another on Fridays for proviſions. The fairs are Whit-Tueſday, and October 13. The butter made in this part, known in London by the name of Epping-butter, is in particular eſteem, and ſells, in courſe, at a higher price than any other.

EPPING-FOREST, is a royal chaſe, extending from the town of Epping almoſt to London; it was anciently a very extenſive diſtrict, and, under the name of the Foreſt of Eſſex, included a great part of the county. It had afterwards the name of Waltham-foreſt, which has long yielded to its preſent appellation. To this foreſt, that of Hainault, which lies to the ſouth-eaſt, was once an appendage. In Hainault-foreſt, about a mile from Barking Side, ſtands the celebrated oak, known through many centuries by the name of Fairlop. "The tradition of the country," ſays Mr. Gilpin, in his Remarks on Foreſt Scenery, "traces this oak way up the Chriſtian æra. It is ſtill a noble tree, though it has ſuffered greatly from the depredations of time. About a yard from the ground, where its rough fluted ſtem is thirty-ſix feet in circumference, it divides into eleven vaſt arms; yet not in the horizontal manner of an oak, but rather in that of a beech. Beneath its ſhade, which overſpreads an area of 300 feet in circuit, an annual fair has long been held on the ſecond of July; and no booth is ſuffered to be erected beyond the extent of its boughs." This venerable oak is now fenced round with a cloſe paling, about five feet high. Almoſt all the extremities of its branches have been ſawed off, and Mr. Forſyth's compoſition applied to them, to preſerve them from decay; and the injuries which the trunk of the tree had ſuſtained, have been repaired, as much as poſſible, by the ſame compoſition.

Wanſted village, and Wanſted Houſe, the magnificent ſeat and extenſive park and gardens of ſir James Tylney Long, bart. hereditary warden of Epping-foreſt, are very contiguous to Epping town. The ancient manor was granted, by Edward VI. to Robert lord Rich. He ſold it to Robert Dudley, earl of Leiceſter, who, in 1658, entertained queen Elizabeth here, for five or ſix days. Reverting to the crown, king James gave it to ſir Henry Mildmay, who having been one of the judges of Charles I. it was forfeited. Charles II. gave it to the duke of York, who ſold it to ſir Robert Brooks. Of the repreſentatives of this gentleman (who had retired inſolvent to France) it was purchaſed by ſir Joſiah Child, bart. a conſiderable merchant, author of ſome valuable commercial tracts, and great grandfather to the late earl Tylney, from whom it deſcended to the preſent proprietor. Sir Joſiah Child planted a great number of trees in avenues and viſtas leading to the ſcite of the old manſion. His ſon, before he was created viſcount Caſtlemain, laid out ſome extenſive grounds in gardens; and, after theſe were finiſhed, he employed the celebrated Colin Campbell to build the preſent ſtructure, which is caſed with Portland ſtone, and is upwards of 260 feet in length and 70 in depth. It is one of the nobleſt houſes, not only in England, but in Europe; and its grand front is thought to be as fine a piece of architecture as any in Italy. Wanſted Houſe is now celebrious, as affording a ſafe and elegant aſylum to the unfortunate royal Bourbon family, exiled from their patrimonial ſovereignty in France, but protected, comforted, and cheriſhed, by the illuſtrious ſovereign of Great-Britain.

EP'PING, a townſhip of the American ſtates, in Rockingham county, New-Hampſhire, taken from the north-weſt part of Exeter, and incorporated in 1741. It contained by the cenſus of 1796, 1740 inhabitants: ſix miles north-weſt of Exeter, and eighteen weſt of Portſmouth.

EP'PING, a town of Germany, in the archduchy of Auſtria: four miles ſouth Aigen.

EPPIN'GEN, a town of Germany, in the circle of the Lower Rhine, and palatinate of the Rhine, on the Elſatz: ten miles weſt Heilbron, and eighteen ſouth-ſouth-eaſt Heidelberg.

EP'SOM, a neat and pleaſant town in the county of Surrey, nine miles from Dorking, and ſixteen from London, long famous for its mineral waters, its charming opening to Banſtead Downs, and its many handſome contiguous ſeats. Its purging waters were firſt diſcovered in 1618, and, though not in ſuch repute as formerly, yet they are not impaired in virtue, and the ſalt made from them is famous all over Europe, for gently cleanſing, cooling, and purifying the body. Epſom has a market on Friday; and a fair July 25. Near Epſom is Durdans, originally built by George firſt earl of Berkeley, with the materials brought from Nonſuch, when that celebrated royal reſidence, the

once magnificent ſeat of Henry VIII. was demoliſhed. Durdans was formerly inhabited by the father of his preſent majeſty George III.

EP'SOM, a townſhip of the American States, in Rockingham county, New Hampſhire; ten miles eaſt of Concord, and thirty-ſix miles north-weſt of Portſmouth. It was incorporated in 1727; in 1775 it contained 387, and in 1790, 799 inhabitants.

EP'SOM-SALT, a ſalt firſt obtained from the mineral water at Epſom: it came afterwards to be ſeparated from the brine which remains after the cryſtallization of common ſalt, and this is the ſort now in general uſe. It is with this cathartic ſalt, or ſulphat of magneſia, that the purging mineral waters are impregnated, and to which they owe their virtue. This ſalt has a naufeous bitter taſte; is a gentle purgative, operating in general with eaſe and ſafety, yet with ſufficient efficacy, and quickly finiſhing its operation. Two or three drams, diſſolved in a pint of water, or a larger quantity, operates more powerfully and eaſily than twice the quantity in three or four ounces. Its paſſing off haſtily, and not extending its action ſo far as moſt other purgatives, ſeem to be its principal imperfections; though if given in ſmall doſes, it paſſes farther into the conſtitution, promotes the ſecretions in general, and proves an excellent aperient in many chronical diſorders. If the patient keeps warm, ſmall doſes will ſweat him; if cool, they paſs off by urine. As a purge, from an ounce to an ounce and a half is a full doſe, which, when diſſolved in a quart of water that hath a dram of mace or of cardamon-ſeeds previouſly infuſed in it, ſits very eaſy on the ſtomach. For its chemical analyſis and habitudes, ſee the article CHEMISTRY, vol. iv. p. 231.

EP'SOM-WATER, *ſ.* the valuable production of a ſpring at Aſhted, near Epſom, in Surrey. This water has been long in repute, and was the firſt from whence a bitter purging ſalt was acquired. It is one of the moſt noted purging waters in Europe; and its medicinal powers are contained in the ſulphat of magneſia, or ſalt which bears its name. There are different accounts of the products of this water, reſpecting the quantity of its ſolid contents.

From one gallon was procured by Dr. Liſter, 1½ ounce. Dr. Rutty, 1 ounce, and in ſome ſeaſons only half the quantity. Dr. Lucas, only 5 drams and 1 ſcruple.

EP'STEIN, a town of Germany, in the circle of the Upper Rhine, and county of Konigſtein: nine miles north-north-eaſt of Mentz.

EP'TE, a river of France, which runs into the Seine, near Vernon.

EP'WORTH, a town of Lincolnſhire, diſtant from Kinnald Ferry, on the Trent, about four miles; Gainſborough, eleven; Crowle, ſix; Burton, eight; and 166 from London. It has a market on Thurſdays, and two fairs in a year for cattle; one on the firſt Thurſday after new May-day, the other the firſt Thurſday after new Michaelmas. Here is alſo a charity-ſchool. The trade of the place is chiefly the manufacture of ſacking and bagging. A great quantity of hemp and flax is grown in this part of the county, and the poor are moſtly employed in ſpinning.

EP'ULARY, *adj.* [from *epulum*, Lat. a feaſt.] Belonging to a feaſt, pertaining to a banquet. *Scott.*

EPULA'TION, *ſ.* [*epulatio*, Lat.] Banquet; feaſt.—Contented with bread and water, when he would dine with Jove, and pretending to *epulation*, he deſired no other addition than a piece of cheeſe. *Brown.*

EPULO'TIC, *adj.* [from επι, upon, and ελη, Gr. a cicatrix.] Tending to a cicatrix, cicatriſing.

EPULO'TICS, *ſ.* Medicines which dry up the moiſture of wounds, and diſpoſe them to be covered with a ſkin.

EQUABI'LITY, *ſ.* Equality to itſelf; evenneſs; uniformity.—The *equability* of the temperature of the air rendered the Aſiatics lazy. *Arbuthnot.*

E'QUABLE, *adj.* [*æquabilis*, Lat.] Equal to itſelf; even; uniform in reſpect to form, motion, or temperature.—Nothing abates acrimony of the blood more than an *equable* motion of it, neither too ſwift nor too ſlow; for too quick a motion produceth an alkaline, and too ſlow an acid, acrimony. *Arbuthnot.*

E'QUABLY, *adj.* Uniformly; in the ſame tenour; evenly; equally to itſelf.—If bodies move *equably* in concentrick circles, and the ſquares of their periodical times be as the cubes of their diſtances from the common centre, their centripetal forces will be reciprocally as the ſquares of the diſtances. *Cheyne.*

E'QUAL, *adj.* [*æqualis*, Lat.] Like another in bulk, excellence, or any other quality that admits compariſon; neither greater nor leſs; neither worſe nor better.—If thou be among great men, make not thyſelf *equal* with them. *Eccleſ.*

Equal lot
May join us; *equal* joy, as *equal* love. *Milton.*

Adequate to any purpoſe.—The Scots truſted not their own numbers as *equal* to fight with the Engliſh. *Clarendon.*—Even; uniform:

Think not of me: perhaps my *equal* mind
May learn to bear the fate the gods allot me. *Smith.*

In juſt proportion.—It is not permitted me to make my commendation *equal* to your merit. *Dryden.*—Impartial; neutral.

Each to his proper fortune ſtand or fall;
Equal and unconcern'd I look on all:
Rutilians, Trojans, are the ſame to me,
And both ſhall draw the lots their fates decree. *Dryden.*

Indifferent.—They who are not diſpoſed to receive them, may let them alone, or reject them; it is *equal* to me. *Cheyne.*—Equitable; advantageous alike to both parties.—He ſubmitted himſelf, and ſware to all *equal* conditions. *Mac.*—Being upon the ſame terms.—They made the married, orphans, widows, yea and the aged alſo, *equal* in ſpoils with themſelves. *Mac.*

E'QUAL, *ſ.* One not inferior or ſuperior to another.—He would make them all *equals* to the citizens of Rome. 2 *Mac.* ix. 15.

To my dear *equal* in my native land,
My plighted vow I gave: I his received:
Each ſwore with truth, with pleaſure each believ'd:
The mutual contract was to heav'n convey'd. *Prior.*

One of the ſame age.—I profited in the Jews religion above many my *equals* in mine own nation. *Gal.* i. 14.

To E'QUAL, *v. a.* To make one thing or perſon equal to another. To riſe to the ſame ſtate with another perſon.—I know no body ſo like to *equal* him, even at the age he wrote, as yourſelf. *Trumbull.*—To be equal to.—One whoſe all not *equals* Edward's moiety. *Shakeſpeare.*—To recompenſe fully; to anſwer in full proportion:

She ſought Sichæus through the ſhady grove,
Who anſwer'd all her cares, and *equal'd* all her love. *Dryd.*

To E'QUALISE, *v. a.* To make even.—To *equaliſe* accounts we will allow three hundred years, and ſo long a time as we can manifeſt from the Scripture. *Brown.*—To be equal to; *a ſenſe not uſed:*

Ye lofty beeches, tell this matchleſs dame,
That if together ye fed all one flame,
It could not *equaliſe* the hundredth part
Of what her eyes have kindled in my heart. *Waller.*

EQUA'LITY, *ſ.* Likeneſs with regard to any quantities compared.—The ſame degree of dignity.—According to this *equality* wherein God hath placed all mankind, with relation to himſelf, in all the relations between man and man there is a mutual dependance. *Swift.*

One

One ſhall riſe,
Of proud ambition; who, not content
With fair *equality*, fraternal ſtate,
Will arrogate dominion undeſerv'd,
Over his brethren. *Milton.*

Evenneſs; uniformity; conſtant tenour; equability.—Meaſure out the lives of men, and periodically define the alterations of their tempers, conceive a regularity in mutations, with an *equality* in conſtitutions, and forget that variety which phyſicians therein diſcover. *Brown.*

On the very delicate yet intereſting ſubject of *equality*, much has been written, much miſtaken, and much perverted. Neither in England, nor even in France, can the rights of men be underſtood to conſiſt in every perſon's doing what he pleaſes; nor can equality be conſidered as implying the levelling of all property. Yet theſe notions have been artfully diſſeminated, to bring into diſcredit that true principle of *equal rights*, which is the baſis of Engliſh freedom, by thoſe perhaps who have perſonal reaſons for wiſhing to perpetuate political abuſe and corruption. That ſuch have been the deſigns of ſome individuals, is clearly evinced, from the great number of pamphlets written avowedly to eſtabliſh this deceptive idea; but the cool and diſpaſſionate reaſonings of Dr. Paulus of Haarlem, profeſſor Cras of Amſterdam, profeſſor Brown of Utrecht, M. Turgot, Dr. Rennell, and other eminent authors, have contributed to diſpel the alluſion, and to place the *fact* in an obvious and ſatisfactory point of view: and from theſe writers our preſent remarks are ſelected. It is in vain, however, to attempt the diſcuſſion of ſo complicated a queſtion, unleſs the terms be accurately underſtood: it is therefore neceſſary to premiſe, that the word *equality*, in its preſent application, ſuppoſes compariſon, and indicates a certain agreement or reſemblance in the things compared; ſo that ſome properties or circumſtances, belonging to the one, muſt alſo be found to belong to another, which, in this reſpect, is ſaid to be *equal* to the former; and by the nature and number of theſe common circumſtances, the mode and degree of *equality* muſt be eſtimated. Hence equality, as it reſpects mankind, may be reſolved into *phyſical* and *moral*; the former relates to circumſtances which are independent of the will, and which therefore cannot be ſubject to any law; the latter conſiſts in a parity of rights, which law confers, and a parity of duties, which it preſcribes. Moral equality may be termed either natural, or civil, according to the kind of law on which it is founded; and it may be conſidered either as abſolute or relative: in abſolute equality, the parity muſt extend to all rights and duties whatever; whereas, in relative, it is liable only to particular exceptions.

We may now advert to the grand propoſition, *Wherein does the equality of mankind conſiſt?* In order to anſwer this queſtion, it is neceſſary to take into our view thoſe particulars which are common to all; ſuch as the viciſſitudes of health and ſickneſs, of pleaſure and pain, of proſperity and adverſity, to which all men are alike expoſed. Who, that contemplates individuals in theſe points of view, does not diſcern their equality? This may properly be termed *moral* equality, to diſtinguiſh it from that ſimilitude in other reſpects, which may be referred to *phyſical* equality: but theſe two kinds are intimately connected; and, as the common rights and duties of men ariſe from the whole of human nature, ſo moral equality muſt, in ſome reſpect, reſult from phyſical. That equality of rights and duties, ariſing from the common nature and condition of mankind, is not a mere fiction of imagination, but actually takes place in many caſes, not only between nations independent of each other's authority, but alſo between individuals, who happen to be connected by no other ties than thoſe of humanity. It is remarkable that the celebrated M. Necker, greatly miſrepreſents the propoſition, and confounds phyſical with moral equality; though the latter is clearly and correctly indicated by the expreſſion, That all men are born equal with reſpect to rights. This maxim is by no means new; for Monteſquieu has affirmed the very ſame in his Spirit of Laws, book viii. M. Necker ſays, "that men are no otherwiſe equal with reſpect to rights, than in conſequence of their deſire and ſenſe of happineſs;" and then, obſerving that brutes have alſo this deſire and ſenſe, he attempts to ridicule the propoſition, by concluding that brutes are equal to men in rights. This is a groſs miſtake: for the equality of men reſults, not from any particular properties which they may have in common with brutes, but from the aggregate of thoſe which are common to mankind, and which conſtitute human nature. In the animated as well as inanimated nature, in man as well as the inferior creatures, we diſcern not only uniformity but alſo variety; and he muſt be a poor philoſopher indeed, who does not perceive how much this variety, in the moral not leſs than in the phyſical world, contributes to preſerve the order and harmony of the whole. Did mankind come into life like the fabled Theban colony, which ſprang from the ſerpent's teeth, their *abſolute* equality might be poſſible: but we fear the event would be what the poet deſcribes, when he adds,

——*ſuoque*
Marte cadunt fubiti per mutua vulnera fratres.

This, however, is not the caſe; for the moſt ſtriking inequality reſults from the circumſtances in which we are born, and muſt inevitably attend mankind even in a ſtate of nature, were it only in thoſe reſpects which reſult from the various degrees of bodily and mental powers, by which individuals are diſtinguiſhed. Civil ſociety muſt therefore have been the obvious conſequence of the firſt ſocial union, which muſt have ſubſiſted in a ſtate of nature; in which, as mankind increaſed in number, and as individuals became more independent on each other, common laws were found neceſſary, in order to protect the weak againſt the ſtrong, and to preſerve the peace of the community. Theſe firſt rudiments of civil ſociety were probably as ſimple and rude as were the men for whom they were deſigned, till experience taught them to improve theſe regulations, and at length to form regular ſyſtems of legiſlation. Beſide theſe circumſtances of inequality in a ſtate of nature, a very ſtriking one reſults in civil ſociety from the abſolute neceſſity of government. The lower claſſes of citizens, who conſtitute the majority in every ſtate, are too cloſely employed in procuring their ſubſiſtence, to have either time, or inclination, to attain ſufficient knowledge for the diſtribution of juſtice and the adminiſtration of public affairs. Hence it becomes neceſſary to ſelect thoſe for the offices of government, on whom wealth has conferred leiſure; whoſe education has called forth and improved their abilities; and whoſe moral character, as well as talents and knowledge, entitle them to the confidence of the community. From theſe premiſes, we may legitimately conclude, that mankind are equal, inaſmuch as the rights and duties reſulting from human nature are common to all; that hence men ought to be deemed equal in all caſes, except thoſe in which, either from the ties of blood, or from mutual compact, or elſe from the very nature of civil ſociety and government, peculiar rights and duties neceſſarily induce ſubordination, and hence inequality.

It may here be juſtly obſerved, that, as all moral law (and it is by this that man, in whatever ſtate we ſuppoſe him to be, muſt be directed) is founded in the common nature of mankind, all the rights which it confers, all the duties which it preſcribes, muſt be referred equally to every individual. Hence the force of that moral maxim, to act towards others as we would wiſh them to act toward us; which, in fact, preſuppoſes the moral equality of mankind as the principle on which its authority depends; and hence we immediately feel the grand right and correſpondent obligation reſulting from equality; which, however extenſive, may be generally expreſſed in theſe words: "Whatever others, who are our equals, can juſtly require of us, we have an abſolute right to require of them; and they are under the ſame obligation to comply

comply with our requiſition in the latter caſe, as we are to comply with theirs in the former." This right of equality, together with its correſpondent obligation, not only extends to mankind in general, but is applicable to every individual, and to all particular circumſtances and relations; ſo that whoever enters into theſe, is immediately inveſted with all the rights, and bound to all the duties, which nature has connected with them. It is obvious that this right and obligation muſt ſubſiſt equally among different nations collectively conſidered, and that no pretences of precede cy can be valid, unleſs founded on ſome compact, either tacit or expreſs. Arioviſtus felt this equality, when he ſaid to the Roman ambaſſadors, If I wanted any thing of Cæſar I would have gone to him; if he wants any thing of me, let him come to me. And hence Dr. Paulus maintains, that as a dwarf is as much a man as a giant, ſo the ſmalleſt independent republic is equal, with reſpect to its *rights*, to the moſt powerful monarchy. Hence he deprecates all pretences to precedence among ſovereign ſtates; and inſiſts that no ſovereign ſtate can juſtly forbid the commercial intercourſe of its ſubjects with thoſe of other ſtates, except in thoſe caſes alone in which its abſolute ſafety is immediately concerned. He expoſes the abſurdity of every excluſive claim laid to newly-diſcovered countries, except ſuch as is founded on peopling and cultivating thoſe which were uninhabited; and even then the claim can extend no farther than the part occupied by the coloniſts. On all theſe ſubjects it muſt be acknowledged that he is juſt and impartial in his reaſoning: and it is greatly to be lamented that politicians are ſo much more attentive to expedience than to juſtice in their tranſactions:—but as long as an appeal to the ſword is the only mean by which nations can decide their claims, we can ſcarcely hope that impartial juſtice will be the rule of their dealings with one another. The miniſter of each ſtate looks on thoſe of other countries as men who are endeavouring to take all poſſible advantage of any inadvertence into which he may be betrayed, in order to extort all that they can; he therefore thinks himſelf juſtified in adopting a ſimilar conduct, and tries to advance the immediate intereſts of his principals, by practiſing the like diſingenuous arts.

With the equality of mankind, their *liberty* is immediately and inſeparably connected: for, among thoſe who are entirely equal, (that is, who are connected by no relation except the common tie of humanity,) none can have any right to command, nor can any be under an obligation to obey: but as this right of freedom belongs to all alike, it impoſes on every individual the moſt indiſpenſable obligation to refrain from every thing that violates the liberty of any other perſon, and to grant to all around him the peaceable enjoyment of that which he juſtly claims as his own. This right and obligation extends to religious ſentiments and modes of worſhip, to the acquiſition and improvement of property, and to whatever may be ſuppoſed to increaſe the comfort and happineſs of human life. Many writers have maintained that property is not a *natural* but a *civil* right, and that the laws, by which it is regulated, neceſſarily produce inequality; but profeſſor Cras has juſtly ſhewn that property, or excluſive poſſeſſion, is a right of nature, and that the law, by which it is guarded, by aſſigning rights and duties to every individual, tends to eſtabliſh and preſerve moral equality.—It may therefore be proper to contemplate the original tranſition of men, from a ſtate of nature into one of civil ſociety. If ſuch an aſſociation be formed by a number of perſons who are equal, no individual can claim a right to govern the reſt; all have an equal ſhare in the original ſovereignty, which muſt therefore reſide in the citizens collectively, that is, in the people; and they have a right either to exerciſe it themſelves, or to delegate it to one or more of their number, as they may think moſt conducive to their welfare. Hence neither an individual, nor any number of perſons, can poſſibly have an original right to govern without the conſent of the governed; but when, by mutual compact, the people have delegated their authority, the compact ought to be held ſacred and inviolable both by the governor and governed. Thus, in civil ſociety, the equality of men is in ſome reſpects neceſſarily diminiſhed, but this diminution does not affect the eſſential rights and duties of humanity. They lie beyond the reach of civil authority, which ought always to conſider them as principles previouſly eſtabliſhed, that cannot juſtly be violated by any human laws. And, though the governors and the governed, from the authority committed to the one of theſe claſſes, and the obedience required from the other, are unequal in rank and ſtation; yet, if we conſider them as members of the ſame community, as ſubject to the ſame general laws, they are equal, as they all enjoy the ſame general rights, and are bound by the ſame general obligations. Hence the obſervations made by Grotius, that a magiſtrate muſt be conſidered in a double capacity; it is only in his official character that he can have a right to exert authority and to require obedience: in every thing in which his intereſt, as an individual, is concerned, he is equally with others amenable to the laws: he cannot, in a conteſt with the meaneſt citizen, be judge in his own caſe, but muſt ſubmit it to the deciſion of thoſe whom the law appoints, and who muſt proceed impartially as the law directs. This kind of equality, which is eſſential to every free government, may and ought to be ſo modified as to preſerve that decent reſpect for the magiſtrate, which is neceſſary to the preſervation of public order; and this, we may obſerve, is admirably done in our own conſtitution, by rendering the miniſters and adviſers even of the king reſponſible for the wrongs committed in his name.

On entering into civil ſociety, men loſe their natural equality no farther than is abſolutely neceſſary for the welfare of the community, and become ſubject, not to arbitrary power, but to juſt and lawful authority; the nature and limits of which muſt be known from what are commonly called the conſtitutional laws of a ſtate. In all caſes which do not manifeſtly affect the public order and happineſs, every ſubject, when arrived at years of maturity, has a full right to regulate his own conduct according to his own will, without being neceſſarily dependent on that of his fellow-ſubjects, or of the magiſtrate. This limitation of civil authority is evidently juſt and reaſonable; and therefore, in civil ſociety, much of the natural equality of mankind remains; and of liberty, though it be more reſtrained than in a ſtate of nature, enough may be left to render life perfectly ſecure and happy; for every individual retains a full right to act conformably with the dictates of his own will, provided he neither injures the welfare of the community, nor violates the rights of others, who have the ſame claim with himſelf to this freedom. This is all that a good man can deſire.

That men were firſt prompted to enter into civil ſociety in order to ſecure their natural rights, is a principle laid down by every eminent writer on government; and that the firſt or primary object, the right of holding a ſhare in the legiſlature, either perſonally, or by a repreſentative, is a ſtrong feature of equality in every ſuch government. Yet ſome have aſſerted that no civil ſociety founded on ſuch equality could flouriſh; and that, where all the members of the community had equal rights, there would not be proper ſubordination, but that the ſtate would be torn by diſſenſions, of which anarchy and civil war would be the deplorable conſequences. But Dr. Paulus ſhews, that the principle of equality, when properly underſtood, is ſo far from tending to produce ſedition and anarchy, that it neceſſarily ſuppoſes a ſtrict obedience to the laws, and to that authority which is founded on them. Equality of rights is inſeparably connected with equality of moral obligation; and the former cannot be maintained without the obſervance of the latter. In every conſtitution, they who are inveſted with the executive part of government muſt be armed with a power ſufficient to compel every individual to obey the laws, which conſti-

tute

tute the will of the community; and men will more cheerfully and readily obey laws which they, by their repreſentatives, have concurred in making, than thoſe which are impoſed by arbitrary controul, and in the eſtabliſhment of which they had no concern. Arbitrary meaſures at once deſtroy the fundamental principles of civil ſociety, and militate completely againſt the propoſition, "that men are equal in point of natural rights." That this ſpecies of equality ought to be maintained and admitted in all governments, there can be no doubt, becauſe all men are left at liberty by their Creator to exert the faculties and talents which he has given them, in purſuing their own proper happineſs, according to thoſe modes which appear beſt to their own calm and ſober reaſon, aſſiſted by the reaſon of others, and by the revelation which he has made known to them. In the ſight of God, every man, without exception, is juſtified, if he defends this liberty in himſelf; and every man is condemned, if he attack it in another. In this reſpect, all men are equal and on a level: whence it follows, that no man is bound to obey any mere human laws, but thoſe to which he has previouſly aſſented; or in other words, every man has a right to govern himſelf, or to be governed by his own conſent; and which conſent is either expreſsly or tacitly acknowledged in the formation of every free conſtitution.

Equality in right, as thus explained, is, indeed, ſo far from being a novelty, that it is the baſis of that excellent conſtitution under which we have the happineſs to live; and ſo obvious is this principle of right, that profeſſor Brown maintains, though it may appear paradoxical, "that an *equality* the moſt exact and perfect, in reſpect of every moral and ſocial obligation, ſprings from *inequality* itſelf." In this light, the profeſſor ſeems to conſider theſe rights, when he obſerves that there are certain principles ſo ſtrongly interwoven with the human frame, ſo intimately blended with its eſſence, ſo efficient of all that is human, that the violation of them cannot be regarded in any other reſpect than in that of a degradation, nay, an entire extinction, of the diſtinctive attributes of the human character. Of conſequence, (he adds,) every man ſtipulates, by entering into ſociety with his ſpecies, that the enjoyments grounded on theſe principles, or, in other words, the rights which attach to them as the gifts of God to his rational creatures, ſhall be maintained to him inviolate, and reſerves to himſelf the privilege of defending them at all hazards, whenever it is attempted to wreſt them from him. For, as every human being is a conſtituent member of the ſocial body, he is, while he diſcharges the duties incident to his peculiar capacity, entitled, equally with every other, to the grand prerogatives of human nature, which civil ſociety is intended to maintain and improve. Theſe rights are the neceſſary appendages of that equality, which ſubſiſts among all men, amidſt the diverſities which ſociety and civilization have introduced. Civil ſociety, therefore, does not neceſſarily make any one member of the community either the maſter or the ſlave of his fellow-citizens, but only confirms the relations which already exiſted. Inſtead of thus elevating ſome above others, it places all on an equal footing, by making all equally ſubject to the common authority of the laws, which conſtitute the will of the community. This, ſays Dr. Paulus, is the only object of ſociety which concnrs with the precepts and deſign of our Saviour and his apoſtles. Chriſtianity is founded on univerſal brotherly love, and commands men to love their fellow mortals as themſelves; that is, to live as in a fraternal ſociety of equals. Our own Engliſh laws delight in *equality*: for whatever offence be committed againſt them, whether of murder, of fraud, or of miſdemeanour, either by the peer or the peaſant, the puniſhment of the crime admits of no diſtinction, ſo preciſely *equal* do the culprits ſtand. In affairs at common law, equality of rights is ſcrupulouſly maintained; ſo that when a charge is made againſt any one perſon, and divers ought to bear it, he ſhall have relief againſt the reſt. 2 *Rep.* 25. And where a man leaves a power to his wife to give an eſtate among three daughters, in ſuch proportions as ſhe ſhall think fit: it has been held that ſhe muſt divide it *equally*; unleſs good reaſon be given for doing otherwiſe. *Preced. Canc.* 256. And in our courts of equity it is a *maxim*, that "EQUALITY IS EQUITY." *Francis's Maxims, fol.* 9. With reſpect to that perverted doctrine of *univerſal equality among men*, which would level all diſtinctions, and divide *equally* the goods of fortune, the principles of it are ſo abſurd, ſo incompatible with reaſon, and ſo utterly impoſſible to every ſtate and condition of ſociety, that we might well be ſurpriſed how the public mind could for one moment be deluded by it. On this ſubject M. Turgot has ſatisfactorily ſhewn, that inequality in the diviſion of property inevitably flows from natural cauſes. His principles are clear, and his arguments convincing. They are well worth the conſideration of thoſe who think that an equal diſtribution of a man's eſtate between his children would baniſh from the world that inequality of fortune, which has always exiſted in ſociety. This may indeed be combated on a moral principle: phyſical principles are however too ſtubborn to give way to what may be called moral propriety. M. Turgot's argument is as follows:—"The primeval or original proprietors would occupy as much land as their ſtrength would permit them with their families to cultivate. A man of greater ſtrength, more laborious, more attentive about the future, would occupy more than a man of a contrary character. He, whoſe family is the moſt numerous, having greater wants and more hands, extends his poſſeſſions farther; this is a firſt cauſe of inequality. Every piece of ground is not equally fertile; two men with the ſame extent of land, may reap a very different harveſt; this is a ſecond ſource of inequality. Property in deſcending from fathers to their children, divides into greater or leſs portions, according as the deſcendants are more or leſs numerous, and as one generation ſucceeds another, ſometimes the inheritances again ſubdivide, and ſometimes re-unite again by the extinction of ſome of the branches; this a third ſource of inequality. The difference of knowledge, of activity, and, above all, the œconomy of ſome, contraſted with the indolence, inaction, and diſſipation, of others, is a fourth principle of inequality, and the moſt powerful of all: the negligent and inattentive proprietor, who cultivates badly, who in a fruitful year, conſumes in frivolous things the whole of his ſuperfluity, finds himſelf reduced on the leaſt accident to requeſt aſſiſtance from his more provident neighbour, and to live by borrowing. If by any new accident, or by a continuation of his negligence, he finds himſelf not in a condition to repay, he is obliged to have recourſe to new loans, and at laſt has no other reſource but to abandon a part, or even the whole, of his property to his creditor, who receives it as an equivalent; or to aſſign it to another, in exchange for other valuables with which he diſcharges his obligation to his creditor."—Hence it follows moſt clearly, that if all the individuals now on the face of the earth were to be made equal in the preſent hour, they could not poſſibly be found ſo in the next.

Yet an apparently ingenious writer, Mr. Pilkington, inſiſts, that by following the benevolent precepts of our bleſſed Saviour, in diſtributing our property among thoſe who are deſtitute, it would ſoon annihilate all difference of rank and condition, and quickly eſtabliſh univerſal equality amongſt men. If this writer could but enforce his opinion, many perſons would think him, inſtead of an advocate for an *equality* of *rights*, a much more formidable opponent than even Thomas Paine. A propoſition ſo chimerical may ſuit the poor; but it will never operate upon the rich, particularly while a man may be as good a Chriſtian with *twenty thouſand* pounds, as with *twenty* pounds a-year. But that this doctrine of *univerſal equality* is not only miſchievous in its operation, but completely falſe in fact, is ſhewn in very ſtriking colours by the Rev. Dr. Rennell, maſter of the Temple, in his diſcourſes, lately publiſhed. We ſhall give the paſſage in his own words:

"At no time were men BORN equal; at no time did they BECOME, or if they were, could they CONTINUE, equal. Even previous to the exiſtence of civil government, this inequality exiſted. It is aſſerted, and with the utmoſt truth, by the profoundeſt reaſoner and matureſt thinker in Pagan antiquity, that man BROUGHT not EQUALITY, but SUBORDINATION, to political ſociety. The family diſtinctions of FATHER and CHILD, HUSBAND and WIFE, MASTER and SERVANT, exiſted BEFORE, and prepared the way for the civil relation of SUBJECT and MAGISTRATE. The ſame inequality which ſubſiſted in the *origin*, is eſſentially neceſſary to the *continuance* of the political machine. The inequality of property is the foundation of all honeſt induſtry and exertion; the protection of property once acquired is the only preventive of never-ceaſing bloodſhed, violence, and confuſion. The commoneſt ſenſe muſt inform us, that the contrary doctrine is equally deſtructive of *poor* as well as rich. Deprive the merchant of his opulence, and where can the numerous manufacturers and their families find that plentiful and comfortable maintenance, which lies open to honeſt induſtry in every commercial town in theſe kingdoms? Take from the landholder his eſtates, and where will the farmer, and much more his labourer, fly for refuge? Where will be thoſe improvements and operations of agriculture, which ſuppoſe, and neceſſarily infer, a much larger portion of landed property than can come to any man's ſhare upon an equal diviſion?" See theſe ſeveral works, and the volumes of Monthly Review, New Series.

EQUA'LITY, in painting and ſculpture, is repreſented by a middle-aged woman, holding in her right hand a pair of ſcales, and in her left a ſwallow's neſt, in which the parent bird is equally dividing the food to her young.

E'QUALL, *ſ.* Equality:

Thou, that preſum'ſt to weigh the world anew,
And all things to an *equall* to reſtore,
Inſtead of right, me ſeemes, great wrong doſt ſhew,
And far above thy force's pitch to ſore. *Spenſer.*

E'QUALLY, *adv.* In the ſame degree with another perſon or thing; alike.—To reconcile men's vices to their fears is the aim of all the various ſchemes and projects of ſin, and is *equally* intended by atheiſm and immorality. *Rogers.*—Evenly; equably; uniformly.—If the motion of the ſun were as unequal as of a ſhip, ſometimes ſlow, and at others ſwift; or, if being conſtantly *equally* ſwift, it yet was not circular, and produced not the ſame appearances, it would not help us to meaſure time more than the motion of a comet does. *Locke.*—Impartially:

We ſhall uſe them,
As we ſhall find their merits and our ſafety
May *equally* determine. *Shakeſpeare.*

E'QUALNESS, *ſ.* Equality:

Let me lament
That our ſtars unreconcileable ſhould have divided
Our *equalneſs* to this. *Shakeſpeare.*

EQUAN'GULAR, *adj.* [from *equus* and *angulus*, Lat.] Conſiſting of equal angles.

EQUANI'MITY, *ſ.* [*æquanimitas*, Lat.] Evenneſs of mind, neither elated nor depreſſed.

EQUA'NIMOUS, *adj.* [*æquanimis*, Lat.] Even; not dejected; not elated.

E'QUANT, *ſ.* an imaginary circle conceived by aſtronomers, for correcting the Ptolemaic ſyſtem, and called the *equalizing circle*. See ASTRONOMY, vol. ii. p. 330.

EQUA'TION, *ſ.* [*æquare*, Lat.] The inveſtigation of a mean proportion collected from the extremities of exceſs and defect, to be applied to the whole.—We are to find out the extremities on both ſides, and from and between them the middle daily motions of the ſun along the ecliptic; and to frame tables of *equation* of natural days, to be applied to the mean motion by addition or ſubtraction, as the caſe ſhall require. *Holder.*—By an argument taken from the *equations* of the times of the eclipſes of Jupiter's ſatellites, it ſeems that light is propagated in time, ſpending in its paſſage from the ſun to us about ſeven minutes of time. *Newton.*

EQUA'TION, *ſ.* in algebra, an expreſſion of the ſame quantity in two diſſimilar terms, but of equal value; as, 3s.=36*d*. See ALGEBRA, vol. i. p. 288—290.

EQUA'TION, *ſ.* in aſtronomy, the difference between the time marked out by the ſun's apparent motion, and the time that is meaſured by its real or middle motion; according to which clocks and watches ought to be adjuſted. See ASTRONOMY.

EQUA'TOR, *ſ.* [*æquator*, Lat.] The equator on the earth, or equinoctial in the heavens, is a great circle, whoſe poles are the poles of the world. It divides the globe into two equal parts, the northern and ſouthern hemiſpheres. It paſſes through the eaſt and weſt points of the horizon; and at the meridian is raiſed as much above the horizon as is the complement of the latitude of the place. Whenever the ſun comes to this circle, it makes equal days and nights all round the globe, becauſe he then riſes due eaſt and ſets due weſt, which he doth at no other time of the year. See the articles ASTRONOMY and GEOGRAPHY.—By reaſon of the convexity of the earth, the eye of man, under the *equator*, cannot diſcover both the poles: neither would the eye, under the poles, diſcover the ſun in the *equator*. *Brown.*

Rocks rich in gems, and mountains big with mines,
That on the high *equator* ridgy riſe,
Whence many a burſting ſtream auriferous plays. *Thomſon.*

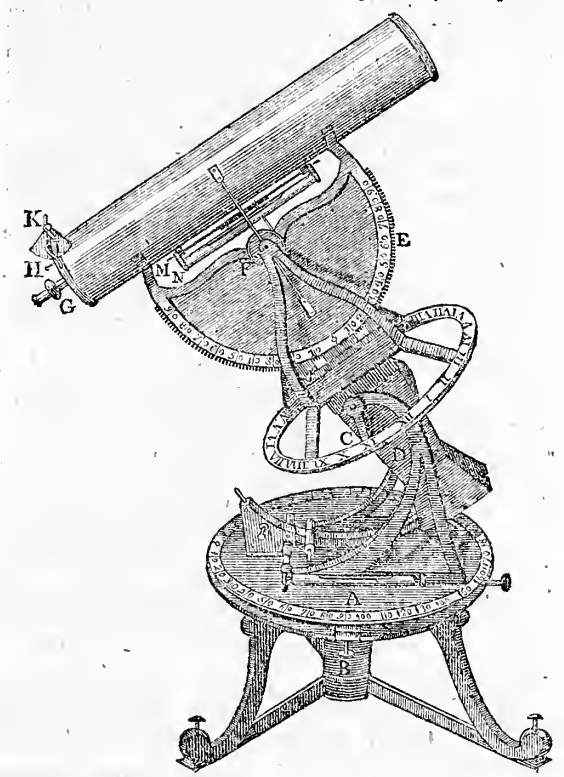
EQUATO'RIAL, *adj.* Pertaining to the equator; taken at the equator.—The planets have ſpheroidical figures, and obliquities of their *equatorial* to their ecliptic planes. *Cheyne.*

EQUATO'RIAL, *ſ.* An inſtrument calculated to anſwer a number of uſeful purpoſes in practical aſtronomy. It may be employed in any ſteady room or place, and it performs moſt of the uſeful problems with the greateſt accuracy. It is the invention of the ingenious Mr. Ramſden; and conſiſts of the following parts, as ſhewn in the annexed figure. A, the azimuth or horizontal circle, which repreſents the horizon of the place, and moves on a long axis B, called the vertical axis. C, the equatorial or hour-circle, repreſenting the equator, placed at right angles to the polar axis D, or the axis of the earth, upon which it moves. E, the ſemicircle of declination, on which the teleſcope is placed, and moving on the axis of declination, or the axis of motion of the line of collimation F; all which circles are meaſured and divided as in the following Table:

Meaſures of the ſeveral Circles, and diviſions on them.	Radius Inches	Limb divided to	Non. of 30 gives ſeconds	Divid. on limb into pts. of Inc.	Divid. by Non. into pts. of Inc.
Azimuth or horizontal circle	5·1	15′	30″	45th	1350th
Equatorial or hour circle	5·1	15′, or 1 m. in time	30″ 2″	45th	1350th
Vertical ſemicircle for declination or latitude	5·	15′	30″	42d	1260th

The teleſcope placed on the ſemicircle of declination, is an achromatic refractor with a triple object-glaſs, whoſe focal diſtance is 17 inches, and its aperture 2·45 inches, and it is furniſhed with ſix different eye-tubes; ſo that its magnifying powers extend from 44 to 168. The teleſcope in this equatorial may be brought parallel to the polar axis, as in the figure, ſo as to point to the pole-ſtar in any part of its diurnal revolution; and thus it has been obſerved near noon, when the ſun has ſhone very bright.

bright. The apparatus for correcting the error in altitude occaſioned by refraction, which is applied to the eye-end of the teleſcope, conſiſts of a ſlide G, moving in a groove or dove-tail, and carrying the ſeveral eye-tubes of the teleſcope, on which ſlide there is an index corresponding to five ſmall diviſions engraved on the dove-tail; it has a very ſmall circle, called the refraction circle H, moveable by a finger-ſcrew at the extremity of the eye-end of the teleſcope; which circle is divided into half minutes, one whole revolution of it being equal to 3′ 18″, and by its motion it raiſes the centre of the croſs-hairs on a circle of altitude; and alſo a quadrant I, of $1\frac{1}{2}$ inch radius, with diviſions on each ſide, one expreſſing the degree of altitude of the object viewed, and the other expreſſing the minutes and ſeconds of error occaſioned by refraction, correſponding to that degree of altitude. To this quadrant is joined a ſmall round level, K, which is adjuſted partly by the pinion that turns the whole of this apparatus, and partly by the index of the quadrant; for which purpoſe the refraction circle is ſet to the ſame minute, &c. which the index points to on the limb of the quadrant; and if the minute, &c. given by the quadrant,



exceed the 3′ 18″ contained in one entire revolution of the refraction circle, this muſt be ſet to the exceſs above one or more of its entire revolutions; then the centre of the croſs-hairs will appear to be raiſed on a circle of altitude to the additional height which the error of refraction will occaſion at that altitude.

The principal adjuſtment in this inſtrument, is that of making the line of collimation to deſcribe a portion of an hour circle in the heavens: in order to which, the azimuth circle muſt be truly level; the line of collimation, or ſome correſponding line repreſented by the ſmall braſs rod M parallel to it, muſt be perpendicular to the axis of its own proper motion; and this laſt axis muſt be perpendicular to the polar axis. On the braſs rod M there is occaſionally placed a hanging level N, the uſe of which will appear in the following adjuſtment: The azimuth circle may be made level by turning the inſtrument till one of the levels be parallel to an imaginary line joining two of the feet ſcrews; then adjuſt that level with theſe two feet ſcrews; turn the circle 180°, or half round; and if the bubble be not then right, correct half the error by the ſcrew belonging to the level, and the other half error by the two foot ſcrews, repeating this operation till the bubble come right; then turn the circle 90° from the two former poſitions, and ſet the bubble right, if it be wrong, by the foot ſcrew at the end of the level; when this is done, adjuſt the other level by its own ſcrew, and the azimuth circle will be truly level. The hanging level muſt then be fixed to the braſs rod by two hooks of equal length, and made truly parallel to it: for this purpoſe, make the polar axis perpendicular or nearly perpendicular to the horizon; then adjuſt the level by the pinion of the declination ſemicircle: reverſe the level, and if it be wrong, correct half the error by a ſmall ſteel ſcrew that lies under one end of the level, and the other half error by the pinion of the declination ſemicircle, repeating the operation till the bubble be right in both poſitions. To make the braſs rod, on which the level is ſuſpended, at right angles to the axis of motion of the teleſcope, or line of collimation, make the polar axis horizontal, or nearly ſo; ſet the declination ſemicircle to 0°, and turn the hour circle till the bubble come right; then turn the declination circle to 90°; adjuſt the bubble by raiſing or depreſſing the polar axis (firſt by hand till it be nearly right, afterwards tighten with an ivory key the ſocket which runs on the arch with the polar axis, and then apply the ſame ivory key to the adjuſting ſcrew at the end of the ſaid arch till the bubble come quite right); then turn the declination circle to the oppoſite 90°; if the level be not then right, correct half the error by the aforeſaid adjuſting ſcrew at the end of the arch, and the other half error by the two ſcrews that raiſe or depreſs the end of the braſs rod. The polar axis remaining nearly horizontal as before, and the declination ſemicircle as 0°, adjuſt the bubble by the hour circle; then turn the declination ſemicircle to 90°, and adjuſt the bubble by raiſing or depreſſing the polar axis; then turn the hour circle 12 hours; and if the bubble be wrong, correct half the error by the polar axis, and the other half error by the two pair of capſtan ſcrews at the feet of the two ſupports on one ſide of the axis of motion of the teleſcope; and thus this axis will be at right angles to the polar axis. The next adjuſtment, is to make the centre of the croſs-hairs remain on the ſame object, while the eye-tube is turned quite round by the pinion of the refraction apparatus: for this adjuſtment, ſet the index on the ſlide to the firſt diviſion on the dove-tail; and ſet the diviſion marked 18″ on the refraction circle to its index; then look through the teleſcope, and with the pinion turn the eye-tube quite round; then if the centre of the hairs does not remain on the ſame ſpot during that revolution, it muſt be corrected by the four ſmall ſcrews, two and two at a time, which will be found upon unſcrewing the neareſt end of the eye-tube that contains the firſt eye-glaſs; repeating this correction till the centre of the hairs remain on the ſpot looked at during a whole revolution. To make the line of collimation parallel to the braſs rod on which the level hangs, ſet the polar axis horizontal, and the declination circle to 90°, adjuſt the level by the polar axis; look through the teleſcope on ſome diſtant horizontal object, covered by the centre of the croſs hairs: then invert the teleſcope, which is done by turning the hour circle half round; and if the centre of the croſs-hairs does not cover the ſame object as before, correct half the error by the uppermoſt and lowermoſt of the four ſmall ſcrews at the eye-end of the large tube of the teleſcope; this correction will give a ſecond object now covered by the centre of the hairs, which muſt be adopted inſtead of the firſt object; then invert the teleſcope as before; and if the ſecond object be not covered by the centre of the hairs, correct half the error by the ſame two ſcrews as were uſed before: this correction will give a third object, now covered by the centre of the hairs, which muſt be adopted inſtead of the

ſecond

ſecond object; repeat this operation till no error remain; then ſet the hour circle exactly to 12 hours, the declination circle remaining at 90° as before; and if the centre of the croſs-hairs do not cover the laſt object fixed on, ſet it to that object by the two remaining ſmall ſcrews at the eye-end of the large tube, and then the line of collimation will be parallel to the braſs rod. For rectifying the nonius of the declination and equatorial circles, lower the teleſcope as many degrees, &c. below 0° on the declination ſemicircle as are equal to the complement of the latitude; then elevate the polar axis till the bubble be horizontal; and thus the equatorial circle will be elevated to the co-latitude of the place: ſet this circle to 6 hours; adjuſt the level by the pinion of the declination circle; then turn the equatorial circle exactly 12 hours from the laſt poſition; and if the level be not right, correct one half of the error by the equatorial circle, and the other half by the declination circle: then turn the equatorial circle back again exactly 12 hours from the laſt poſition; and if the level be ſtill wrong, repeat the correction as before, till it be right, when turned to either poſition: that being done, ſet the nonius of the equatorial circle exactly to 6 hours, and the nonius of the declination circle exactly to 0°.

The chief uſes of this equatorial are, Firſt, To find the meridian by one obſervation only: for this purpoſe, elevate the equatorial circle to the co-latitude of the place, and ſet the declination ſemicircle to the ſun's declination for the day and hour of the day required; then move the azimuth and hour circles both at the ſame time, either in the ſame or contrary direction, till you bring the centre of the croſs-hairs in the teleſcope exactly to cover the centre of the ſun; when that is done, the index of the hour circle will give the apparent or ſolar time at the inſtant of obſervation; and thus the time is gained, though the ſun be at a diſtance from the meridian; then turn the hour circle till the index points preciſely at 12 o'clock, and lower the teleſcope to the horizon, in order to obſerve ſome point there in the centre of the glaſs; and that point is the meridian mark, found by one obſervation only. The beſt time for this operation is three hours before, or three hours after, twelve at noon.—Secondly, To point the teleſcope on a ſtar, though not on the meridian, in full day-light. Having elevated the equatorial circle to the co-latitude of the place, and ſet the declination ſemicircle to the ſtar's declination, move the index of the hour circle till it ſhall point to the preciſe time at which the ſtar is then diſtant from the meridian, found in the tables of the right aſcenſion of the ſtars, and the ſtar will then appear in the glaſs.—Beſides theſe uſes, peculiar to this inſtrument, it may alſo be applied to all the purpoſes to which the principal aſtronomical inſtruments are applied; ſuch as a tranſit inſtrument, a quadrant, and an equal-altitude inſtrument.

EQUE'A, a town of Africa, on the Gold Coaſt.

E'QUERY, or EQUERRY, *ſ.* [*ecuyer*, Fr.] An officer who has the care and management of the horſes of a king or prince. Stables for horſes, furniſhed with all conveniences. The lodging places or apartments of the equerries or grooms.

E'QUES, *ſ.* the KNIGHT; a new genus of fiſhes in Block's ſyſtem; for the ſpecies of which ſee CHÆTODON.

EQUE'STRIAN, *adj.* [*equeſtris*, Lat.] Being on horſeback.—An *equeſtrian* lady appeared upon the plains. *Spectator.*—Skilled in horſemanſhip. Belonging to the ſecond rank in Rome.

EQUESTRIAN GAMES, among the Romans, horſe-races, of which there were five kinds: the *prodromus* or plain horſe-race, the *chariot-race*, the *decurſory-race* about funeral piles, the *ludi ſevirales*, and the *ludi neptunales*.

EQUESTRIAN ORDER, the knights or equites of ancient Rome.

EQUE'STRIAN STATUE, in ſculpture, the figure of a perſon on horſeback.—See the article SCULPTURE.

EQUIAN'GULAR, *adj.* in mathematics, a figure that has all its angles equal among themſelves; as the ſquare, and all the regular figures. An equilateral figure inſcribed in a circle, is always equiangular. But an equiangular figure inſcribed in a circle, is not always equilateral, except when it has an odd number of ſides: If the ſides be of an even number, then they may either be all equal, or elſe half of them will always be equal to each other, and the other half to each other, the equals being placed alternately. *Equiangular*, is alſo ſaid of any two figures of the ſame kind, when each angle of the one is equal to a correſponding angle in the other, whether each figure, ſeparately conſidered in itſelf, be an equiangular figure or not; that is, having all its angles equal to each other. Thus, two triangles are equiangular to each other, if, ex. gr. one angle in each be of 30°, a ſecond angle in each of 50°, and the third angle of each equal to 100 degrees. *Equiangular triangles* have not their like ſides neceſſarily equal, but only proportional to each other; and ſuch triangles are always ſimilar to each other.

EQUICU'LUS or EQUUS MINOR, a conſtellation of the northern hemiſphere. See EQUULEUS.

EQUICRU'RAL, or EQUICRURE, *adj.* [*æquus* and *crus*, Lat.] Having legs of an equal length, and longer than the baſe; iſoſceles.—An *equicrure* triangle goes upon a certain proportion of length, and breadth. *Digby.*—We ſucceſſively draw lines from angle to angle, until ſeven *equicrural* triangles be deſcribed. *Brown.*

EQUIDIF'FERENT, *adj.* in arithmetic, belonging to a ſeries of four quantities in which there is the ſame difference between the firſt and ſecond as between the third and fourth.

EQUIDIS'TANCE, *ſ.* [from *equidiſtant.*] The ſtate of being equally diſtant.

EQUIDIS'TANT, *adj.* [*equus* and *diſtans*, Lat.] At the ſame diſtance.—The fix ſtars are not all placed in the ſame concave ſuperficies, and *equidiſtant* from us, as they ſeem to be. *Ray.*

EQUIDIS'TANTLY, *adv.* At the ſame diſtance.—The liver, ſeated on the right ſide, by the ſubclavian diviſion *equidiſtantly* communicates unto either arm. *Brown.*

EQUIFO'RMITY, *ſ.* [*æquus* and *forma*, Lat.] Uniform equality.—No diverſity or difference, but a ſimplicity of parts and *equiformity* of motion. *Brown.*

EQUILA'TERAL, *adj.* [*equus* and *latus*, Lat.] Having all ſides equal.—Circles or ſquares, or triangles *equilateral*, which are all figures of equal lines, can differ but in greater or leſſer. *Bacon.*

To EQUILI'BRATE, *v. a.* To balance equally; to keep even with equal weight on each ſide.—The bodies of fiſhes are *equilibrated* with the water in which they ſwim. *Arbuthnot.*

EQUILIBRA'TION, *ſ.* Equipoiſe; the act of keeping the balance even.—In ſo great a variety of motions, as running, leaping, and dancing, nature's laws of *equilibration* are obſerved. *Derham.*

EQUILI'BRIUM, *ſ.* [Lat.] Equipoiſe; equality of weight.—Equality of evidence, motives, or powers of any kind.—Health conſiſts in the *equilibrium* between thoſe two powers, when the fluids move ſo equally that they don't preſs upon the ſolids with a greater force than they can bear. *Arbuthnot.*—*Equilibrium* in ſolid bodies forms a conſiderable part of the ſcience of ſtatics; and equilibrium of fluids a conſiderable part of the doctrine of hydroſtatics. *Hutton.*

It is in *equilibrio*
If deities deſcend or no;
Then let th' affirmative prevail,
As requiſites to form my tale. *Prior.*

EQUIMUL'TIPLES, *ſ.* in arithmetic and geometry, numbers or quantities multiplied by one and the ſame number or quantity. Hence, equimultiples are always in

the ſame ratio to each other as the ſimple quantities before multiplication: thus, if 6 and 8 are multiplied by 4, the equimultiples 24 and 32 will be to each other as 6 to 8.

EQUINE'CESSARY, *adj.* [*æquus* and *neceſſarius*, Lat.] Needful in the ſame degree:

For both to give blows and to carry,
In fights, are *equineceſſary*. *Hudibras.*

EQUINOC'TIAL, *ſ.* [*æquus* and *nox*, Lat.] A great circle conceived in the heavens, under which the terreſtrial equator moves in its diurnal motion. The poles of this circle are the poles of the world. It divides the ſphere into two equal parts, the northern and ſouthern. See ASTRONOMY, vol. i. p. 325, &c. The *equinoctial points*, are the two oppoſite points where the ecliptic and equinoctial croſs each other; the one point being in the beginning of Aries, and called the vernal point, or vernal equinox; and the other in the beginning of Libra, and called the autumnal point, or autumnal equinox. It is found by obſervation, that the equinoctial points, and all the other points of the ecliptic, are continually moving backwards, or in antecedentia, i. e. weſtwards. This retrograde motion of the equinoctial points, is that phenomenon called the Preceſſion of the Equinoxes. See ASTRONOMY, p. 372.

EQUINOC'TIAL, *adj.* Pertaining to the equinox:

Thrice th' *equinoctial* line
He circled; four times croſs'd the car of night
From pole to pole, traverſing each colure. *Milton.*

Happening about the time of the equinoxes.—Being near the equinoctial line; having the properties of things near the equator:

In vain they covet ſhades and Thracia's gales,
Pining with *equinoctial* heat. *Philips.*

EQUINOC'TIALLY, *adv.* In the direction of the equinoctial.—They may be refrigerated inclinately, or ſomewhat *equinoctially*; that is, towards the eaſtern and weſtern points. *Brown.*

E'QUINOX, *ſ.* [*æquus* and *nox*, Lat.] Equinoxes are the preciſe times in which the ſun enters into the firſt point of Aries and Libra; for then, moving exactly under the equinoctial, he makes our days and nights equal. This he doth twice a year, about the 21ſt of March and 23d of September, which therefore are called the vernal and autumnal equinoxes. See ASTRONOMY.

'Twas now the month in which the world began,
If March beheld the firſt created man;
And ſince the vernal *equinox*, the ſun
In Aries twelve degrees or more had run. *Dryden.*

Equality; even meaſure. *Improper:*

Do but ſee his vice;
'Tis to his virtue a juſt *equinox*;
The one as long as th' other. *Shakeſpeare.*

Equinoctial wind; a poetical uſe:

The paſſage yet was good; the wind, 'tis true,
Was ſomewhat high, but that was nothing new,
No more than uſual *equinoxes* blew. *Dryden.*

EQUINU'MERANT, *adj.* [*æquus* and *numerus*, Lat.] Having the ſame number; conſiſting of the ſame number.—This talent of gold, though not *equinumerant*, nor yet equiponderant, as to any other; yet was equivalent to ſome correſpondent talent in braſs. *Arbuthnot.*

To EQUIP', *v. a.* [*equipper*, Fr.] To furniſh for a horſeman or cavalier. To furniſh; to accoutre; to dreſs out.—The country are led aſtray in following the town; and *equipped* in a ridiculous habit, when they fancy themſelves in the height of the mode. *Addiſon.*

E'QUIPAGE, *ſ.* [*equipage*, Fr.] Furniture for a horſeman. Carriage of ſtate; vehicle:

Myriads, between two brazen mountains lodg'd
Againſt a ſolemn day, harneſs'd at hand,
Celeſtial *equipage!* *Milton.*

Attendance; retinue. Accoutrements; furniture:

Soon as thy dreadful trump begins to ſound,
The god of war, with his fierce *equipage*,
Thou do'ſt awake, ſleep never-he ſo ſound. *Spenſer.*

E'QUIPAGED, *adj.* Accoutered; attended; having fine habits; having ſplendid retinue:

She forth iſſued with a goodly train
Of ſquires and ladies, *equipaged* well,
And entertained them right fairly, as befell. *Spenſer.*

EQUIPARA'TES, *ſ.* [*æquiparata*, Lat.] In logic, things compared and made equal.

EQUIPEN'DENCY, *ſ.* [*æquus* and *pendeo*, Lat.] The act of hanging in equipoiſe; not determined either way.—The will of man, in the ſtate of innocence, had an entire freedom, a perfect *equipendency* and indifference to either part of the contradiction, to ſtand or not to ſtand. *South.*

EQUIP'MENT, *ſ.* The act of equipping or accoutring.—Accoutrement; equipage.

E'QUIPOISE, *ſ.* [*æquus*, Lat. and *poids*, Fr.] Equality of weight; equilibration; equality of force.—In the temperate zone of our life there are few bodies at ſuch an *equipoiſe* of humours, but that the prevalency of ſome one indiſpoſeth the ſpirits. *Glanville.*

EQUIPOL'LENCE, *ſ.* [*æquus* and *pollentia*, Lat.] Equality of force or power.

EQUIPOL'LENT, *adj.* [*æquipollens*, Lat.] Having equal power or force; equivalent.—Votary reſolution is made *equipollent* to cuſtom, even in matter of blood. *Bacon.*

EQUIPON'DERANCE, or EQUIPON'DERANCY, *ſ.* [*æquus* and *pondus*, Lat.] Equality of weight; equipoiſe.

EQUIPON'DERANT, *adj.* [*æquus* and *ponderans*, Lat.] Being of the ſame weight.—A column of air, of any given diameter, is *equiponderant* to a column of quickſilver of between twenty-nine and thirty inches height. *Locke.*

To EQUIPON'DERATE, *v. n.* [*æquus* and *pondero*, Lat.] To weigh equal to any thing.—The heavineſs of any weight doth increaſe proportionably to its diſtance from the centre: thus one pound A at D, will *equiponderate* unto two pounds at B, if the diſtance A D is double unto A B. *Wilkins.*

EQUIPON'DEROUS, or EQUIPONDIOUS, *adj.* [*æquus* and *pondus*, Lat.] Equilibrated; equal on either part. *Not in uſe.*—The ſceptics affected an indifferent *equipondious* neutrality, as the only means to their ataraxia. *Glanville.*

EQUI'RIA, *ſ.* Feſtivals eſtabliſhed at Rome, by Romulus, in honour of Mars, when horſe-races and games were exhibited in the Campus Martius. *Varro.*

EQUISE'TUM, *ſ.* [of Pliny; from *equi ſeta*, Lat. horſe-hair.] HORSE-TAIL; in botany, a genus of the claſs cryptogamia, order filices, natural order of filices or ferns. The generic characters are—Fructifications diſpoſed into a long ovate-oblong ſpike; each orbiculate, gaping at the baſe with ſeveral valves, connected by a flat ſhield-ſhaped top.

Deſcription. Roots perennial, creeping. They are leafleſs herbs, with a hollow ſtreaked ſtem, either ſimple or branched, the branchlets uſually diſpoſed in whorls; it is jointed, and the joints are ſurrounded with a toothed ſheath. The vernal ſtems uſually bear a ſort of cone, and ſoon periſh; theſe are ſucceeded by others without cones, and laſting much longer. Perhaps the former are males, the latter females, in which the ſex has not been diſcovered. Hedwig takes the little balls for the ſtigma, and the briſtles covered with duſt, converging in wet, and ſpreading in a dry ſituation, for ſtamens. Linnæus, Scopoli, Curtis, and others, conſider the powder in the ſpikes as the ſeed. Adanſon has removed the horſe-tails from the cryptogamous plants, and placed them in the family of pines, from which they differ in every reſpect.

Species. 1. Equiſetum ſylvaticum, or wood horſe-tail: ſtem ſpiked, fronds compound. This grows to the height of a foot or eighteen inches, and even of three or four feet. There are twelve or more (ſixteen to twenty-four, *Leers*; twenty-four to thirty, *Scop.*) branchlets, or leaves

as ſome call them, in a whorl; theſe are very ſlender, about five inches long, quadrangular, and beſet with ſeveral other ſecondary whorls, having five to ſeven branchlets on each; ſo that the whole reſembles a pine-tree in miniature. The flowering ſpike is at the end of the frond. Native of moſt parts of Europe, in woods and ſhady places; flowering in April and May. According to Linnæus, it is a principal food of horſes in ſome parts of Sweden. Scopoli affirms that it is noxious to kine, making them ſhed their teeth, and bringing on a diarrhœa. This is alſo ſaid of the two next ſpecies.

2. Equiſetum arvenſe, or corn horſe-tail: fruit-bearing ſcape naked, barren leafy. The naked flowering ſtems appear early in the ſpring, and ſoon decay: they are the thickneſs of a large wheat ſtraw, a hand's breadth or more in height, upright, yelloviſh, with from two to five joints, covered with membranous ribbed ſheaths, divided at the top into numerous ſegments or teeth. Native of moſt parts of Europe, the Levant, Japan, and North America, in corn-fields and wet meadows, flowering in March, April, and May. It is a troubleſome weed, and difficult to extirpate. The country people call it *horſe-pipe* and *ſnake-pipe*. It is ſuppoſed to indicate ſubterraneous flowing waters or ſprings.

3. Equiſetum paluſtre, or marſh horſe-tail: ſtem angular, fronds ſimple. The ſtem is a foot or eighteen inches high, nearly ſmooth, channelled with five or ſix deep furrows. Grows in marſhes and ditches; flowering in June.

E. pal. minus polyſtachion, the variety, has ſmaller fronds, almoſt all the branchlets having a ſpike at the end, but that at the end of the ſtem twice as large as the reſt.

4. Equiſetum fluviatile, or river horſe-tail: ſtem ſtreaked, fronds almoſt ſimple. This is the largeſt of all the European ſpecies. The ſtem is three or four feet high, the thickneſs of a finger, and ſometimes near an inch in diameter, ſtreaked, not furrowed, ſmooth, ſoft, of a pale or whitiſh colour at firſt, but blackiſh in decay; joints numerous, ſheaths ſtreaked, and divided into as many long linear dents as there are branchlets in the whorl, that is, from twenty-four to thirty, thirty-ſix, and even forty; the branchlets or leaves are quadrangular, and generally ſimple. The ſpikes grow diſtinct from the fronds on ſcapes, but from the ſame root; theſe come out earlier, are a foot or eighteen inches in height, and the ſpikes are replete with a blueiſh powder. Haller tells us that this ſpecies was eaten by the common people among the Romans; and Linnæus affirms, that rein-deer, who refuſe hay, will however eat this; that it is cut as fodder for kine, with a view to increaſe their milk; but that it is not ſo acceptable to horſes. Native of Europe, on the banks of rivers, lakes, ponds, and ditches; flowering in May and June.

5. Equiſetum limoſum, or ſmooth horſe-tail: ſtem almoſt naked, ſmooth, and even. This grows three or four feet high, and is often quite deſtitute of leaves, but ſometimes produces a few ſtraggling ones. Haller is of opinion that this is only a variety of the paluſtre. Linnæus and Leers ſuſpect it to be a variety of the foregoing. Found in watery places, lakes, ponds, and ditches; flowering in May and June.

6. Equiſetum hyemale, or rough horſe-tail: ſtem naked, ſcabrous, ſubracemed at the baſe. Stems evergreen, about eighteen inches high, naked and unbranched for the moſt part, but ſometimes emitting two or three lateral branches near the baſe; they are furrowed with eighteen or twenty rough obtuſe angles, and many of the joints are three inches aſunder. This is the beſt ſpecies for poliſhing wood and metal, as being the hardeſt and rougheſt. Hence our old writers called it *ſhave-graſs*. It is much uſed by the whiteſmiths and cabinet-makers, under the name of Dutch ruſhes. In Northumberland, the dairy-maids ſcour their milk-pails with it. Gerarde ſays, that the women ſcower their pewter and wooden things of the kitchen therewith, and thence call it *pewterwort*; and that the fletchers and comb-makers do rub and poliſh their work with it. Native of Europe, by river ſides, in bogs and watery places, and in wet marſhy places in woods: flowering in July and Auguſt; alſo of Japan.

7. Equiſetum giganteum, or giant horſe-tail: ſtem ſtreaked, arboreſcent; fronds ſimple, ſtrict, ſpike-bearing. We have no deſcription of this ſpecies. It is a native of South America.

Propagation and Culture. Though the horſe-tails be inhabitants of the water, or at leaſt flouriſh beſt where they can lodge their perennial creeping roots in a wet ſoil or ſtrong clay which holds the wet, yet they will grow without difficulty in a garden, eſpecially near water, or under a north wall, or in the ſhade: they require only to be kept within bounds, as they run much at the root; it is better, therefore, to plant them in pots, plunged in the earth, than in the open ground. It is not ſo eaſy to extirpate them from cultivated lands. Haller ſays that he tried in vain to accompliſh it by ploughing, dunging, and other methods; and that any one who publiſhed the ſecret of deſtroying this unpropitious weed, ſo injurious to kine, would merit a conſiderable reward. Draining lands infeſted with it, would have the beſt chance of removing the evil. See CERATOPHYLLUM, CHARA, HIPPURIS, and ELATINE.

E'QUITABLE, [*equitable*, Fr.] Juſt; due to juſtice.—It ſeems but *equitable* to give the artiſts leave to name them as they pleaſe. *Boyle.*—Loving juſtice; candid; impartial; as, an *equitable* judge.

E'QUITABLENESS, *ſ.* Juſtneſs.—Demonſtrating both the *equitableneſs* and practicableneſs of the thing. *Locke.*

E'QUITABLY, *adv.* Juſtly; impartially.

E'QUITY, *ſ.* [*equité*, Fr. *æquitas*, Lat.] Juſtice; right; honeſty.—Chriſtianity ſecures both the private intereſt of men and the public peace, enforcing all juſtice and *equity*. *Tillotſon.*

Foul ſubordination is predominant,
And *equity* exil'd your highneſs' land. *Shakeſpeare.*

Impartiality.—Liking their own ſomewhat better than other mens, even becauſe they are their own, they muſt in *equity* allow us to be like unto them in this affection. *Hooker.*

E'QUITY, in law, is defined to be a correction, or qualification of the common law, generally made in that part wherein it faileth, or is too ſevere. It likewiſe ſignifies the extenſion of the words of the ſtatute law to caſes unexpreſſed, yet having the ſame reaſon: ſo that where one thing is enacted by ſtatute, all other things are enacted that are of the like degree: for example; the ſtatute of Glouceſter gives action of waſte againſt him that holds lands for life or years; and by the equity thereof, a man ſhall have action of waſte againſt a tenant that holds but for one year, or half-year, which is without the words of the act, but within the meaning of it; and the words that enact the one, by equity enact the other. *Terms de Ley.* So that equity is of two kinds; the one doth abridge and take from the letter of the law; and the other enlarge and add thereto. And ſtatutes may be conſtrued according to equity; eſpecially where they give remedy for wrong, or are for expedition of juſtice, &c. *Co. Lit.* 24. 2 *Inſt.* 106. A court of equity cannot now be created by the king, but the ſame muſt be done by act of parliament. 4 *Inſt.* 84.

The diſtinction between law and equity, as adminiſtered in different courts, is not at preſent known, nor ſeems to have ever been known, in any other country than England. With us the *Aula regia* which was anciently the ſupreme court of judicature, undoubtedly adminiſtered equal juſtice according to the rules of both or either, as the caſe might chance to require: and, when that was broken to pieces, the idea of a court of equity, as diſtinguiſhed from a court of law, did not ſubſiſt in the original plan of partition. For though equity is mentioned by *Bracton l.* 2. *c.* 7. *pl.* 23, as a thing contraſted to ſtrict law, yet neither in that writer, nor in Glanvill or Fleta, nor yet in Britton, (compoſed under the auſpices and in the name

name of Edward I. and treating particularly of courts and their ſeveral juriſdictions,) is there a ſyllable to be found relating to the equitable juriſdiction of the court of chancery. It ſeems therefore probable, that when the courts of law, proceeding merely upon the ground of the king's original writs, and confining themſelves ſtrictly to that bottom, gave a harſh or imperfect judgment, the application for redreſs uſed to be to the king in perſon aſſiſted by his privy council; (from whence alſo aroſe the juriſdiction of the court of requeſts, which was virtually aboliſhed by 16 Car. I. c. 10;) and they were wont to refer the matter either to the chancellor and a ſelect committee, or by degrees to the chancellor only, who mitigated the ſeverity, or ſupplied the defects, of the judgments pronounced in the courts of law, upon weighing the circumſtances of the caſe. This was the cuſtom not only among our Saxon anceſtors, before the inſtitution of the *Aula regia*, but alſo after its diſſolution, in the reign of Edward I. and perhaps during its continuance, in that of Henry II. *Ll. Ed. c. 2. Lamb. Arch.* 59.

When, about the end of the reign of Edward III. uſes of land were introduced, and though totally diſcountenanced by the courts of common law, were conſidered as fiduciary depoſits and binding in conſcience by the clergy, the ſeparate juriſdiction of the chancery as a court of equity began to be eſtabliſhed. John Waltham, biſhop of Saliſbury, and chancellor to Richard II. (by a ſtrained interpretation of the ſtatute of Weſtminſter 2. (13 *Edw* I. *c.* 24,) enabling the clerks in chancery to form new writs according to the ſpecial circumſtances of each caſe,) deviſed the writ of ſubpœna, returnable in the court of chancery only, to make the feoffee to uſes accountable to his *ceſtui que uſe*: which proceſs was afterwards extended to other matters wholly determinable at the common law, upon fictitious ſuggeſtions; for which therefore the chancellor himſelf is b 17 Rich. II. c. 6, directed to give damages to the party unjuſtly aggrieved. But as the clergy, had long attempted to turn their eccleſiaſtical courts into courts of equity, by entertaining ſuits *pro læſione fidei*, as a ſpiritual offence againſt conſcience, in caſe of non-payment of debts or any breach of civil contracts; till checked by the Conſtitutions of Clarendon (10 Hen. II. c. 15); therefore probably the eccleſiaſtical chancellors, who then held the ſeal, were remiſs in abridging their own new acquired juriſdiction; eſpecially as the ſpiritual courts continued to graſp at the ſame authority as before, till finally prohibited by the unanimous concurrence of all the judges.

In the time of lord chancellor Elleſmere, A. D. 1616, aroſe that famous diſpute between the courts of law and equity, ſet on foot by ſir Edward Coke, then chief juſtice of the court of king's bench; whether a court of equity could give relief after or againſt a judgment at the common law. This conteſt was ſo warmly carried on, that indictments were preferred againſt the ſuitors, the ſolicitors, the counſel, and even a maſter in chancery, for having incurred a præmunire by queſtioning in a court of equity a judgment in the court of king's bench, obtained by groſs fraud and impoſition. This matter being brought before the king, was by him referred to his learned counſel for their advice and opinion; who reported ſo ſtrongly in favour of the courts of equity, that his majeſty gave judgment on their behalf. *Whitelock* of *Parl.* 2, 390. Lord Bacon, who ſucceeded lord Elleſmere, reduced the practice of the court into a more regular ſyſtem; his ſucceſſors in the reign of Charles I. did little to improve upon his plan; till the appointment of ſir Heneage Finch in 1673, who became afterwards earl of Nottingham. He was a perſon of the greateſt abilities and moſt uncorrupted integrity; a thorough maſter and zealous defender of the laws and conſtitution of his country; and endued with a pervading genius that enabled him to diſcover and to purſue the true ſpirit of juſtice, notwithſtanding the embarraſſments raiſed by the narrow and technical notions which then prevailed in the courts of law, and the imperfect ideas of redreſs which had poſſeſſed the courts of equity. The reaſon and neceſſities of mankind, ariſing from the great change in property by the extenſion of trade and the abolition of military tenures, co-operated in eſtabliſhing his plan, and enabling him in the courſe of nine years to build a ſyſtem of juriſprudence and juriſdiction, upon wide and national foundations, which have alſo been extended and improved by many great men, who have ſince preſided in chancery.

Upon the abolition of the court of wards, the care, which the crown was bound to take as guardian of its infant tenants, was totally extinguiſhed in every feodal view; but reſulted to the king in his court of chancery, together with the general protection of all other *infants* in the kingdom. When therefore a fatherleſs child has no other guardian, the court of chancery has a right to appoint one, and from all proceedings relative thereto, an appeal lies to the houſe of lords. The court of exchequer can only appoint a guardian *ad litem*, to manage the defence of the infant if a ſuit be commenced againſt him; a power which is incident to the juriſdiction of every court of juſtice. *Cro. Jac.* 641. But when the intereſt of a minor comes before the court judicially, in the progreſs of a cauſe, or upon a bill for that purpoſe filed, either tribunal indiſcriminately will take care of the property of the infant. As to ideots and lunatics, the king himſelf uſed formerly to commit the cuſtody of them to proper committees, in every particular caſe; but now to avoid ſolicitations and the very ſhadow of undue partiality, a warrant is iſſued by the king under his royal ſign manual to the chancellor, to perform this office for him: and if he acts improperly in granting ſuch cuſtodies, the complaint muſt be made to the king himſelf in council. 3 *P. Wms.* 108. But the previous proceedings on the commiſſion, to enquire whether or no the party be an ideot or a lunatic, are on the law-ſide of the court of chancery, and can only be redreſſed, if erroneous, by writ of error in the regular courſe of law.

The king, as *parens patriæ*, has the general ſuperintendence of all charities; which he exerciſes by the chancellor. And, therefore, when neceſſary, the attorney-general, at the relation of ſome informant, (who is uſually called the relator) files *ex officio* an information in the court of chancery to have the charity properly eſtabliſhed. By ſtat. 43 Eliz. c. 4, authority is given to the lord chancellor, and to the chancellor of the duchy of Lancaſter, reſpectively, to grant commiſſions under their ſeveral ſeals, to enquire into any abuſes of charitable donations, and rectify the ſame by decree; which may be reviewed in the reſpective courts of the ſeveral chancellors, upon exceptions taken thereto. But, though this is done in the petty-bag office in the court of chancery becauſe the commiſſion is there returned, it is not a proceeding at common law, but treated as an original cauſe in the court of equity. The evidence below is not taken down in writing, and the reſpondent in his anſwer to the exceptions may allege what new matter he pleaſes; upon which they go to proof, and examine witneſſes in writing upon all the matters in iſſue: and the court may decree the reſpondent to pay all the coſts, though no ſuch authority is given by the ſtatute. And as it is thus conſidered as an original cauſe throughout, an appeal lies of courſe from the chancellor's decree to the houſe of peers, notwithſtanding any looſe opinions to the contrary. *Duke's Char. Uſes*, 62, 128.

By the ſeveral ſtatutes relating to bankrupts, a ſummary juriſdiction is given to the chancellor, in many matters conſequential or previous to the commiſſions thereby directed to be iſſued; from which the ſtatutes give no appeal. The juriſdiction of the court of chancery doth not however extend to ſome cauſes, wherein relief may be had in the exchequer. No information can be brought, in chancery, for ſuch miſtaken charities as are given to the king by the ſtatutes for ſuppreſſing ſuperſtitious uſes. Nor can chancery give any relief againſt the king, or direct any act to be done by him, or make any decree diſpoſing

poſing of or affecting his property; not even in caſes where he is a royal truſtee. Such cauſes muſt be determined in the court of exchequer, as a court of revenue; which alone has power over the king's treaſure, and the officers employed in its management, unleſs where it properly belongs to the duchy court of Lancaſter.

Equity is to be conſidered as aſſiſtant to the juriſdiction of the courts of law; 1ſt. By removing legal impediments to the fair deciſion of a queſtion depending in courts of law. 2dly. By compelling a diſcovery which may enable them to decide. 3dly. By perpetuating teſtimony, when in danger of being loſt, before the matter to which it relates can be made the ſubject of judicial inveſtigation. It may alſo be ſaid to be aſſiſtant, by rendering the judgments of courts of law effective, as by providing for the ſafety of property in diſpute pending a litigation; by counteracting fraudulent judgments; and by putting a bound to vexatious and oppreſſive litigation. It exerciſes a concurrent juriſdiction with courts of law, in moſt caſes of fraud, accident, miſtake, account, partition, and dower. It claims an excluſive juriſdiction in all matters of truſt and confidence; and wherever, upon the principles of univerſal juſtice, the interference of a court of judicature is neceſſary to prevent a wrong, and the poſitive law is ſilent. See Mitford's Treatiſe on the Pleadings in Chancery. This juriſdiction may, in the greater number of caſes in which it is exerciſed, be juſtified by the propriety of preventing a multiplicity of ſuits; for, as the mode of proceeding in courts of law requires the plaintiff to eſtabliſh his caſe, without enabling him to draw the neceſſary evidence from the examination of the defendant, juſtice could never be attained at law in thoſe caſes where the principal facts to be proved by one party are confined to the knowledge of the other party. In ſuch caſes, therefore, it becomes neceſſary for the party, in want of ſuch evidence, to reſort to the extraordinary powers of a court of equity, which will compel the neceſſary diſcovery; and the court, having acquired cognizance of the ſuit for the purpoſe of diſcovery, will entertain it for the purpoſe of relief, in moſt caſes of fraud, account, accident, and miſtake; and for other reaſons will entertain ſuits for partition and dower, though diſcovery be not neceſſary to the plaintiff's caſe.

The caſe (and, it ſeems, the only caſe) in which fraud cannot be relieved againſt in equity, concurrently with courts of law, though diſcovery be ſought, is the caſe of fraud, in obtaining a will; which, ſince the caſe of Kerrick *v.* Bransby, 3 *Brown's Parl. Caſ.* 358, is conſtantly referred to a court of law in the ſhape of an iſſue, *deviſavit vel non*. That courts of equity have a concurrence of juriſdiction with courts of law, in all other matters of fraud; ſee White *v.* Huſſey, *Pre. Ch.* 14. Hungerford *v.* Earle, 2 *Vern.* 261. Colt *v.* Woollaſton, 2 *Pr. Wms.* 156. Stent *v.* Baillis, 2 *P. Wms.* 220. 2 *Comyns's Digeſt*, titles *Chancery* and *Fraud*.

The juriſdiction exerciſed by our courts of equity, in moſt caſes of *accident*, preſents a very ſtriking inſtance of their anxiety to prevent innovation on the juriſdiction of courts of law: their interference being generally founded on ſome circumſtance, which prevents the party being relievable at law; as where a bond or other inſtrument or ſecurity, is loſt, equity will interfere, by compelling a diſcovery from the defendant, and will relieve upon ſuch diſcovery; but the plaintiff is not entitled to any relief, upon a mere ſuggeſtion that the bond, inſtrument, or ſecurity, is loſt; but is required, for the purpoſe of relief, to annex to his bill, an affidavit to ſuch effect. *Mitford's Treatiſe* 112. And, as a further ſecurity againſt innovation, it muſt appear that the loſs of the deed or inſtrument obſtructs the plaintiff in ſeeking relief at law: for the loſs of a deed is not always a ground to come into a court of equity for relief; if there was no more in the caſe, although he is entitled to have a diſcovery of that, whether loſt or not, courts of law admit evidence of the loſs of a deed, proving the exiſtence of it and its contents, juſt as a court of equity does. There are two grounds to come into equity for relief, annexing an affidavit to the bill. Firſt, where the deed is deſtroyed or concealed by the defendant; and whenever that is the caſe, the plaintiff is intitled to have relief in this court, upon the reaſon in lord Hunſdon's caſe. *Hob.* 109. Another is, where the plaintiff cannot recover at law, without making profert of the deed in pleading at law. Whitfield *v.* Fauſſet, 1 *Vez.* 392. But where the relief ſought in equity is upon the loſs of a bill of exchange, or promiſſory note, the plaintiff muſt, by his bill, offer to give ſecurity, as an indemnity to the defendant, againſt any demand being made upon him in reſpect of ſuch loſt bill or note. Walmſley *v.* Child, 1 *Vez.* 341.

The juriſdiction of our courts of equity, in matters of dower, for the purpoſe of aſſiſting the widow with a diſcovery of the lands or title deeds, or of removing impediments to her rendering her legal title available at law, has never been doubted. But it has been queſtioned, whether equity could give relief in thoſe caſes, in which there appeared to be no obſtacle to her legal remedy. Wallis *v.* Everard, 3 *Ch. R.* 87. It ſeems now, however, to be ſettled, that the widow labours under ſo many diſadvantages at law, from the embarraſſments of truſt terms, &c. that ſhe is fully entitled to every aſſiſtance that a court of equity can give her, not only in paving the way for her to eſtabliſh her right at law, but alſo by giving complete relief when the right is aſcertained. Curtis *v.* Curtis, 2 *Bro. C. R.* 634. And in the exerciſe of this juriſdiction, courts of equity will even enforce a diſcovery againſt a purchaſer for valuable conſideration without notice. Williams *v.* Lambe. 3 *Bro. Ch. Rep.* 264. And though the widow ſhould die before ſhe had eſtabliſhed her right to dower, equity will, in favour of her perſonal repreſentatives, decree an account of the rents and profits of the lands, of which ſhe afterwards appeared dowable.

The eſſential difference (ſays Blackſtone) between law and equity principally conſiſts in the different modes of adminiſtering juſtice in each, in the mode of *proof*, the mode of *trial*, and the mode of *relief*. Upon theſe, and upon two other accidental grounds of juriſdiction, viz. the true conſtruction of ſecurities for money lent and the form and effect of a truſt or ſecond uſe, hath been principally erected that ſtructure of juriſprudence, which prevails in our courts of equity, and is inwardly bottomed upon the ſame ſubſtantial foundations as the ſyſtem of the courts of common-law. As to the mode of *proof*. When facts, or their leading circumſtances, reſt only in the knowledge of the party, a court of equity applies itſelf to his conſcience, and purges him upon oath with regard to the truth of the tranſaction; and, that being once diſcovered, the judgment is the ſame in equity as it would have been at law. But, for want of this diſcovery at law, the courts of equity have acquired a concurrent juriſdiction with every other court in all matters of account. 1 *Chan. C.* 57. As incident to accounts, they take a concurrent cognizance of the adminiſtration of perſonal aſſets. 2 *P. Wms.* 145; conſequently of debts, legacies, the diſtribution of the reſidue, and the conduct of executors and adminiſtrators. As incident to accounts, they alſo take the concurrent juriſdiction of tithes, and all queſtions relating thereto; of all dealings in partnerſhip; and other mercantile tranſactions; and ſo of bailiffs, receivers, factors, agents, &c.

The mode of *trial*, is by interrogatories adminiſtered to the witneſſes, upon which their depoſitions are taken in writing, wherever they happen to reſide. If therefore the cauſe ariſes in a foreign country, and the witneſſes reſide upon the ſpot; if in cauſes ariſing in England, the witneſſes are abroad, or ſhortly to leave the kingdom; or if the witneſſes reſiding at home are aged or infirm; any of theſe caſes lays a ground for a court of equity to grant a commiſſion to examine them, and (in conſe-

quence) to exercise the same jurisdiction which might have been exercised at law, if the witnesses could probably attend.

E'QUITY OF REDEMPTION, on *mortgages*. If where money is due on a mortgage, the mortgagee is desirous to bar the equity of redemption, he may oblige the mortgager either to pay the money or to be foreclosed of his equity; which is done by proceedings in the court of chancery. But the chancery cannot shorten the time of payment of the mortgage money, where it is limited by express covenant; though it may lengthen it: and then upon non-payment, the practice is to foreclose the equity of redemption of the mortgagor. 2 *Vent.* 364. To foreclose the equity, a bill in chancery is exhibited; to which an answer is put in, and a decree being obtained, a master in chancery is to certify what is due for principal, interest, and costs, which is to be paid at a time prefixed by the decree, whereupon the premises are to be reconveyed to the mortgagor; or, in default of payment, the mortgagor is ordered to be foreclosed from all equity of redemption, and to convey the premises absolutely to the mortgagee.

A fine or non-claim will bar equity of redemption: but in a common mortgage, a covenant to restrain it shall not be regarded in chancery. 2 *Vent.* 365. If the condition of a mortgage is, that the mortgagor only should redeem during life, or that he and the heirs of his body shall do it; yet the general heir shall have the equity of redemption, for if the principal and interest be offered, the land is free. 1 *Vern.* 30, 190. And it is held, though a bond be conditioned, that if the money be not paid at such a time, then for a further sum the mortgagee shall have the land absolutely, as a purchasor, &c. in such case a man may also redeem. See the article MORTGAGE.

EQUI'VALENCE, or EQUIVALENCY, *s.* [*æquus* and *valeo*, Lat.] Equality of power or worth.—Civil causes are equivalent unto criminal causes, but this *equivalency* only respects the careful and diligent admission of proofs. *Ayliffe.*

To EQUI'VALENCE, *v. a.* To equiponderate; to be equal to.—Whether the trangression of Eve seducing did not exceed Adam seduced, or whether the resistibility of his reason did not *equivalence* the facility of her seduction, we shall refer to schoolmen. *Brown.*

EQUI'VALENT, *adj.* [*æquus* and *valens*, Lat.] Equal in value. Equal in any excellence:

No fair to thine
Equivalent, or second! which compell'd
Me thus, though importune perhaps, to come
And gaze, and worship thee. *Milton.*

Equal in force or power:

The dread of Israel's foes, who, with a strength
Equivalent to angels, walk'd their streets,
None offering fight. *Agonistes.*

Of the same cogency or weight.—The consideration of public utility is, by very good advice, judged at the least the *equivalent* to the easier kind of necessity. *Hooker.*—Of the same import or meaning.—The use of the word minister is brought down to the literal signification of it, a servant; for now to serve and to minister, servile and ministerial, are terms *equivalent*. *South.*

EQUI'VALENT, *s.* A thing of the same weight, dignity, or value.—Fancy a regular obedience to one law will be a full *equivalent* for their breach of another. *Rogers.*

The slave without a ransom shall be sent;
It rests for you to make th' *equivalent*. *Dryden.*

EQUI'VOCAL, *adj.* [*æquivocus*, Lat.] Of doubtful signification; meaning different things, standing for different notions.—Words of different significations, taken in general, are of an *equivocal* sense; but being considered with all their particular circumstances, they have their sense restrained. *Stilling fleet.*—Uncertain; doubtful; happening different ways.—There is no such thing as *equivocal* or spontaneous generation; but all animals are generated by animal parents of the same species with themselves. *Ray.*

Those half-learn'd witlings, num'rous in our isle,
As half-form'd insects on the banks of Nile;
Unfinish'd things, one knows not what to call,
Their generation's so *equivocal*. *Pope.*

EQUI'VOCAL, *s.* Ambiguity; word of doubtful meaning.—Shall two or three wretched *equivocals* have the force to corrupt us? *Dennis.*

EQUI'VOCALLY, *adv.* Ambiguously; in a doubtful or double sense.—Words abstracted from their proper sense and signification, lose the nature of words, and are only *equivocally* so called. *South.*—By uncertain or irregular birth; by equivocal generation; by generation out of the stated order.—No insect or animal did ever proceed *equivocally* from putrefaction, unless in miraculous cases; as in Egypt by the divine judgments. *Bentley.*

EQUI'VOCALNESS, *s.* Ambiguity; double meaning.—Distinguish the *equivocalness* or latitude of the word, and then point out that determinate part which is the ground of my demonstration. *Norris.*

To EQUI'VOCATE, *v. n.* [*æquivocatio*, Lat.] To use words of double meaning; to use ambiguous expressions; to mean one thing and express another.—Not only Jesuits can *equivocate*. *Dryden.*

My soul disdain'd a promise;—
—But yet your false *equivocating* tongue,
Your looks, your eyes, your ev'ry motion promis'd:
But you are ripe in frauds, and learn'd in falsehoods. *Smith.*

EQUIVOCA'TION, *s.* [*æquivocatio*, Lat.] Ambiguity of speech; double meaning.—Reproof is easily misapplied, and through *equivocation* wrested. *Hooker.*

I pull in resolution, and begin
To doubt the *equivocation* of the fiend
That lies like truth. *Shakespeare.*

EQUIVOCA'TOR, *s.* One who uses ambiguous language; one who uses mental reservation.—Here's an *equivocator*, that could swear in both the scales against either scale; yet could not *equivocate* to heaven. *Shakespeare.*

EQUO'REAN, *adj.* [from the Lat. *æquor*, the sea.] Belonging to the sea. *Scott.*

EQUULE'US, EQUICULUS, and EQUUS MINOR, EQUI SECTIO, *the horse's head*, one of the forty-eight old constellations in the northern hemisphere. Its stars, in Ptolomy's catalogue, are four, in Tycho's four, in Hevelius's six, and in Flamsteed's ten.

EQUULE'US, *s.* a kind of rack for extorting confessions, at first chiefly practised on criminals, but afterwards made use of against the Christians. It was made of wood, having holes at certain distances, with a screw, by which the criminal was stretched to the third, sometimes to the fourth or fifth, holes, his arms and legs being fastened on the equuleus with cords; and thus was hoisted aloft, and extended in such a manner, that all his bones were dislocated. In this state red-hot plates were applied to his body, and he was goaded in the sides with an instrument called *ungula*.

EQ'UUS, *s.* [from *equus*, Lat. equal, *quod equi pares solent quadrigis jungi*, because they are used to be yoked together.] The HORSE: in zoology, a genus of quadrupeds belonging to the order of belluæ. This genus comprehends six species, viz. the horse, the dshiggetai or wild mule, the ass, the zebra, the quagga, and the bisulcus, or cloven-footed horse of Chili. The generic characters are: six erect and parallel fore-teeth in the upper jaw, and six somewhat more prominent ones in the under jaw; tusks or dog-teeth solitary, or remote from the rest; feet, in the first five species, consist of an undivided hoof. In the males, the teats are situated on the glans penis; and this genus has the singular properties of *voluntary* erection, and of breathing only through the nostrils, and not through the mouth.

1. *Equus Cabullus*, the wild, and domeſtic, HORSE; diſtinguiſhed by a long flowing mane, and the tail wholly covered with long hairs.—The horſe is known among moſt nations of the world, in a domeſtic ſtate. In gracefulneſs of form and dignity of carriage, he appears ſuperior to every other quadruped. Among all the inferior animals, man has found no other equally manageable and uſeful with the horſe. He is lively and high-ſpirited, yet gentle and tractable; vigorous and active; keen and ardent in his exertions, yet firm and perſevering. He ſeems equally qualified for all the different purpoſes for which man can wiſh to employ him: he ſubmits peaceably to the draught; exults in the race; diſdains every obſtacle in hunting; and on the road advances cheerfully with his maſter, for whom he conceives the attachments of a companion. In war, he performs every evolution with the utmoſt dexterity, and diſplays a degree of ardour for battle, which the courage even of the braveſt ſoldier cannot excel. The voice of this animal is peculiar; we call it *neighing*. The male becomes capable of propagating his ſpecies at the age of two or three years; and the female admits his embraces even at an earlier period. But the foals produced from ſuch young parents are of little value; ſo neceſſary is it that all animals ſhould be ſufficiently mature, before the ſexual contact takes place. In a ſtate of nature, this premature intercourſe is chiefly prevented by the jealous vigilance of thoſe that have arrived at their full vigour and ſtrength. The period of geſtation is 290 days. Horſes are known to live, when their days are not ſhortened by ill uſage, commonly to the age of five-and-twenty or thirty years.

The horſe, like the other domeſtic animals, has, no doubt, been originally tamed by human art. Wild horſes are ſtill found in various parts of the world. But this ſpecies of animals have been ſo long known in a domeſtic ſtate, and their uſeful qualities have cauſed them to be diffuſed ſo generally over the globe, that it is impoſſible to diſcover, with any degree of certainty, of what country they were originally natives. Wild horſes are found in the country lying round the lake Aral; on the river Tom, in the ſouthern part of Siberia; in the great Mongalian deſerts; and among the Kalkas, north-weſt of China. Theſe horſes are ſmaller than the domeſtic; their hair, particularly in winter, is very thick, and generally of a mouſe colour. Their heads are larger, in proportion to their bodies, than thoſe of the tame horſes; and their foreheads remarkably arched. They herd together in large companies, and often gather round the horſes of the Mongols and Kalkas, while grazing in the fields, and carry them off among them. They are obſerved to be very watchful of their common ſafety. While the herd is feeding, the native ſagacity of the horſe is manifeſted in a very extraordinary manner: a leader is ſtationed before, with its ears thrown forwards, and a centinel placed behind, with its ears hent back, to guard againſt ſurpriſe both ways; and when danger of any kind approaches, they warn their fellows by neighing, on which they all betake themſelves to flight with the utmoſt ſpeed. Yet the Kalmuks frequently ride in among the herds on very fleet tame horſes, and kill them with broad lances. Hawks are alſo uſed in taking the wild horſes; thoſe birds are taught to fix on its forehead, where they teaſe and diſtreſs it in ſuch a manner as to prevent it from eſcaping its purſuer. In the wilds of Africa too, particularly in the country adjoining to the Cape of Good Hope, numbers of wild horſes are found. Their ſize is ſmall; their diſpoſition vicious; and no art, we are told, can ſucceed in taming them. The Hottentots and Caffrees kill them for food.

In the deſerts, on each ſide of the river Don, particularly towards the Palus Mæotis and the town of Backmut, there is a race of wild horſes, which are known to be the progeny of the Ruſſian horſes that were turned looſe from the ſiege of Aſoph in 1697, for want of forage. The Coſſacks chaſe and kill theſe for their ſkins. When they happen to take a young one, it is domeſticated by coupling it for a few months with a tame horſe. Theſe are in general much ſtronger than the tame horſes of the country. The horſes of the Tartars copulate and breed with the wild horſes which carry them off: and the offſpring produced by this intermixture are diſtinguiſhable by their colours. In Spaniſh America, there are vaſt herds of wild horſes. But they are known to have been originally introduced by the Spaniards, when they firſt conquered that country. Being ſuffered to run about in thoſe extenſive and unappropriated fields and foreſts, without reſtraint or culture, they have become ſtrangers to man, and have multiplied ſo amazingly, that they are now ſpread over all the ſouth of the American continent, nearly to the Straits of Magellan. The inhabitants of thoſe regions are not without arts for taking them. When taken, they are eaſily tamed; and though ſuffered to return to their former ſtate of freedom, they are ſaid never afterwards to forget their maſters:—a moſt amazing proof of retentive memory. Ancient authors mention wild horſes as inhabitants of many other countries. Herodotus ſpeaks of a race of wild white horſes, that were found on the banks of the river Hypanis in Scythia; and mentions another tribe in the north of Thrace, whoſe hair was five inches long all over the body. Strabo ſpeaks of wild horſes on the Alps, and in Spain. Cardan, who viſited Scotland in the minority of queen Mary, relates that wild horſes then abounded in that country, and in the Orkney iſles. And, indeed, we are told, that in the highlands of Scotland, many of that ſmall breed of horſes, known in the low countries by the name of *ſhelties*, ſtill run about, almoſt wild, among the hills, in a ſtate very little different from that of the wild horſes in South America. It is worthy of notice, that the fabulous records in which the earlier hiſtory of ancient Greece is preſerved, repreſent horſes as having been firſt domeſticated by the inhabitants of Theſſaly, a country bordering on Thrace. The fable of the Centaurs is well known. From every fact that ancient authors have preſerved, or modern travellers relate, concerning the horſe in a wild ſtate, this ſpecies of animals appear to have been deſtined by nature for inhabitants, not merely of one or two different tracts of country, but of a conſiderable part of the globe. An animal ſo uſeful and ſo friendly to man, is happily qualified to be his ſervant and companion in many varieties of climate, and through a great diverſity of local circumſtances.

The wild horſes of Arabia are indiſputably to be preferred for ſwiftneſs and elegance of ſhape. They are found in the deſerts; but are not now ſo numerous as formerly. The natives uſe various arts, and diſplay the greateſt activity and addreſs, in taking them. The ſwiftneſs of the animal, after he is taken, is tried in chacing the oſtrich: if ſucceſsful in this chace, he is valued at a very high price. Horſes are with the Arabians a principal article of commerce. Arabian horſes are, among every nation, eagerly ſought after. They cannot, however, be called *wild*, in any other reſpect than the horſes in South America, or thoſe on the mountains in the north of Scotland. The Arabians ſuffer them to breed and multiply in the deſerts, with a deſign to take and ſell them at proper ſeaſons, or train them for their own uſe. Every Arabian, however humble his ſituation, is poſſeſſed at leaſt of one horſe. They prefer the mare for labour, as being more capable of bearing hunger, thirſt, and fatigue. They generally diſpoſe of their horſes to the Turks; excepting ſuch as they ſelect for ſtallions, which are always the moſt active, beautiful, and vigorous. In Arabia the breed is never croſſed as in other countries, but preſerved unmixed, with the utmoſt ſolicitude. It has been inferred from this, that Arabia may probably have been the original country of horſes.

The next choiceſt race of horſes occurs in Barbary; and among theſe, the mountain barbs are ſaid to be the beſt. In Gambia and Senegal, the chiefs or governors

have very beautiful horſes, of a ſmall ſize: in ſwiftneſs and beauty they nearly approach to thoſe of Arabia. The Arabian breed has ſpread into Egypt, Turkey, and Perſia, where they are of great value. The celebrated Venetian traveller, Marco Paulo, relates, that he ſaw in Perſia a ſtud conſiſting of ten thouſand white mares; and, in one province of that empire, a great number of very large and fleet horſes, whoſe hoofs were ſo hard that they needed not to be ſhod. The Turks alſo procure horſes from Hungary and Tartary, as well as from Arabia. The Tartars aſſociate with their horſes with almoſt as much familiarity as the Arabians; and make them an article of traffic. The Tartarian horſes are ſo eaſily ſubſiſted, that thoſe wandering people are enabled to take out vaſt numbers with them in their predatory excurſions. In the army of the cham, when De Tott accompanied him, there were no fewer than three hundred thouſand of theſe animals. Browne deſcribes the horſes of Soudan in the kingdom of Fur, as numerous and tractable. The beſt are bred in the country of Dongola, and by the Arabs to the eaſt of the Nile. Theſe are perfectly well formed, and full of fire. Their action is grand; yet Browne ſays they are not remarkable for bearing fatigue. The breeders of them are in the habit of feeding them with milk; and rarely, if ever, caſtrate them; nor are they ever ſhod.

The horſes of Arabia and Barbary are often brought into Europe; and through all the countries of the eaſt they are highly prized. The horſes of India are of an inferior kind, being ſmall and ſpiritleſs; the Arabian horſes are therefore much ſought after in Hindooſtan. The barbs have been moſtly introduced into Italy and Spain. The Spaniſh genette is much eſteemed. This variety of the horſe is ſmall, but beautifully ſhaped, ſpirited, and ſwift. The Italian horſes are not in the ſame eſtimation in which they once were; yet they are of a large ſize, high ſpirited, and move gracefully. The Daniſh horſes are excellent for the draught. They are ſtout, but ſeldom elegant, or finely proportioned. They move well; and accordingly make good war horſes. They are often party-coloured; ſometimes ſtreaked like the tyger, or ſpotted like the leopard. The German horſes are originally of the Arabian and the Barbary breed; but they are much degenerated. The Hungarian horſes are excellent both for the draught and the ſaddle; but the Dutch horſes are moſtly preferred on the continent for draught.

The Engliſh horſes are at preſent eſteemed through Europe, more perhaps than thoſe of any other country. The attention paid, in our iſland, to the breed and culture of this noble animal, and the vaſt ſums expended on ſtuds and horſe-races, have naturally produced this effect. The inſtances of ſwiftneſs which the horſes of this iſland have diſplayed at Newmarket, are almoſt incredible. Nor are the horſes of this iſland leſs remarkable for ſtrength, than for ſwiftneſs. Thoſe of Yorkſhire, employed in conveying the manufactures of that county, uſually carry a burden of 420 pounds. Our Britiſh mill horſes often carry, at one load, the weight of 910 pounds. The improvements made by the late Mr. Bakewell, of Diſhley, in Leiceſterſhire, in the ſtrength and ſymmetry of draught horſes, has rendered them at this time the beſt in the world. The horſes alſo on which our cavalry are mounted, are well known to be ſuperior in ſtrength and activity to thoſe in the armies of every other nation in Europe. Under the Anglo-Saxon monarchy, it even appears that the Engliſh horſes muſt have been much eſteemed by foreigners; for there is a law of Athelſtan, prohibiting their exportation, except when intended for preſents. Wales and the Highlands of Scotland ſtill furniſh a breed of ſmall horſes, which are very hardy and patient of fatigue.

It is remarkable that no horſe was found in America when firſt diſcovered; and that even their preſent wild breed ſprung from the ſtock carried there by Europeans. Why this excellent animal was denied to the new continent, almoſt all regions of which are ſo well adapted to his production and maintenance, is a difficulty not eaſily ſolved. Whether they were, *ab origine*, indigenous to one particular country, whence all parts elſe were ſupplied; or whether common to many, and of different races, befitting the nature and circumſtances of each country, is a queſtion that will probably for ever remain undecided. Thus much conſtant obſervation and experience have determined, that the genus varies with ſoil and climate; that the horſes of warm climes and dry ſoils, are of the trueſt proportion, the fineſt ſkin, and the moſt generous ſpirit: of courſe the fleeteſt and fitteſt for the ſaddle: as we approach the north, we find them more robuſt, and formed with very little ſymmetry of ſhape; coarſe-haired, hardy, and ſlow, fitted for draught, and the more laborious purpoſes of life; that the ſpecies will thrive, with proper care, in all habitable countries; but ſucceed beſt under the temperate zones, and upon fruitful and grameniferous ſoils. For the qualifications and beſt forms of this noble animal; age, breeding, ſhoeing, anatomy, and external and internal blemiſhes, diſeaſes, and beſt means of cure, ſee the article FARRIERY, vol. vii. with the numerous and elegant correſponding engravings of a complete diſſection of the horſe, throughout all its parts.

2. *Equus Hemionus*, the DSHIGGETAI, or WILD MULE. This animal, deſcribed by Dr. Pallas and Dr. Zimmerman, and after them by Mr. Pennant, has received the Latin name of *equus hemionus*. By the Mongols it is called *dſhiggetai*, which is ſaid to ſignify the eared; and by the Chineſe *yo to tſe*, the mule; not becauſe it is a mule, but becauſe it reſembles one. It ſeems to have been known to the ancient naturaliſts, Ariſtotle, Theophraſtus, and Pliny. In ſize and general appearance it nearly reſembles the hybrid mule, the progeny of the horſe and the aſs. Its head is rather large in proportion to the body; its forehead is flat, and becomes narrow towards the extremity of the noſe. Its ears are conſiderably longer than thoſe of the horſe; they ſtand erect, and are lined with a thick coat of whitiſh curling hair. Its neck is ſlender and firm, not looſe and ſoft. The breaſt ſwells forward, and is ſharp. The limbs are long and finely ſhaped; the thighs thin, like thoſe of the common mule. There is an oval callus within the fore legs, but none on the hinder legs. The hoofs are oblong, ſmooth, and black. The tail reſembles that of a cow: it is ſlender, one half of it bare, but covered on the other half with long aſh-coloured hairs.

This animal changes its coat with the ſeaſon. In winter, its hair is about two inches long, ſoft, like that of a camel, waved on the back; and, on the ſuperficies, of a grey colour, but under that, of a browniſh aſh-colour. In ſummer, the hair is much ſhorter, beautifully ſmooth, and marked here and there with hairy vortices. The extremity of the noſe is, at this time, white; and from that part, up the front, the colour is nearly tawny. The buttock, the inſide of the limbs, and the under part of the belly, are white. A blackiſh teſtaceous line extends from the mane, along the ridge of the back, to the tail: this line becomes broader upon the loins, and narrower again as it approaches the tail. The upper part of the body is now of a light yellowiſh grey colour, paler towards the ſides. The body of this animal, between the tip of the noſe and the baſe of the tail, is ſix feet ſeven inches long; the trunk of the tail meaſures one foot four inches; the hairs depend about eight inches beyond the extremity of the trunk. The height of the animal is about three feet nine inches.

The hemionus, or dſhiggetai, is mentioned by Ariſtotle to have been found, in ancient times, in Syria. Pliny informs us, on the authority of Theophraſtus, that it was then found likewiſe in Cappadocia. This animal is no longer found in thoſe countries; but it is now known for an inhabitant of Dauuria, and the deſerts between the rivers Onow and Argun, in the moſt ſouthern part of Siberia, of the extenſive plains and deſerts of weſtern Tartary,

Tartary, and of the celebrated ſandy deſerts of Gobi, which reaches to India. They ſhun tracts of wood, and lofty ſnowy mountains. They are not numerous in Siberia; thoſe which are there met with ſeem to be only ſtragglers, that have originally wandered from the large herds which are found to the ſouth of the Ruſſian dominions. In Tartary, they frequent chiefly the country lying round the lake Taricnoor; a ſalt lake which becomes ſometimes dry. They live in ſeparate parties; each of which, conſiſting of mares and colts, with an old male at their head, is ſeldom above twenty, and frequently under that number. Their time of copulation is about the middle or end of Auguſt. They produce only one foal at a time; at leaſt, the inſtances in which a female has more, are very rare. In its third year, the young animal attains its full growth, with the due proportions of form, and the colours which diſtinguiſh it during the reſt of life. When the young have reached this age, the elder mules expel them from their ſociety, and they aſſociate with new parties of their own age. Attempts have in vain been made to tame them, being impatient of all reſtraint or controul. European arts might poſſibly be more ſucceſsful; but, were it taught to be peaceful and domeſtic, like the horſe, it would perhaps degenerate in ſpirit and ſwiftneſs. Hitherto the dſhiggetai has been only an animal of the chace for the Moguls and Tunguſians, who conſider its fleſh as their greateſt dainty, and employ the ſkin to make boots. It is, however, difficult to kill it; for, on account of the keenneſs of its ſight and the acuteneſs of its ſmell, it ſeldom lets the hunters get within ſhot. When running, it outſtrips even the antelope: it is impoſſible for the fleeteſt horſe to overtake it; and therefore it is ſeldom caught during the hunting excurſions of the Moguls, which they call *oblaw*, but muſt be ſhot, by lying in wait for it; which can be beſt done in the neighbourhood of the ſtreams or pools to which it repairs to drink, or of the ſpots where it comes to lick ſalt. The Moguls, however, are ſaid to have remarked, that during rainy and ſtormy weather the dſhiggetai becomes, as it were, ſtupid, and neither ſees nor ſmells the hunters ſo well as at other times. The ſtallions, which conduct herds more or leſs numerous of females, and young ones of from one to two years old, are exceedingly vigilant; keep their females together with the moſt jealous care; drive from the herd the young ſtallions which begin to ſhow a deſire for the females; and are always on the watch to guard againſt being ſurpriſed. When they obſerve any thing uncommon at a diſtance, the male immediately ſprings forwards; endeavours, by making a circuit, to approach ſo near the object as to diſcover the danger, and for that purpoſe advances two or three times towards the hunters, who lie cloſe to the ground on their bellies. On ſuch occaſions they are ſometimes ſhot. If the male, however, obſerves the danger, he makes the herd which he left behind him betake themſelves to flight with incredible velocity. The Moguls ſpeak of this velocity with aſtoniſhment; and, in general, the dſhiggetai is conſidered as the ſwifteſt of all the wild animals of their country; for this reaſon the people of Thibet aſſign it, inſtead of a riding horſe, to *Chammo*, their god of fire and of war.

The dſhiggetai always carries its head erect, and when running, throws it entirely back, in order that it may ſee better behind it; and bears its tail erect. It has a particular kind of neighing, which is louder and ſhriller than that of a horſe. Dr. Pallas diſſected one of them, and found its conformation in every reſpect as perfect as that of the horſe: the dſhiggetai cannot, therefore, be conſidered among the hybrid mules. "This animal, (ſays Dr. Pallas,) ſtands high on its limbs, which are delicate, though its muſcles are ſtrong; but the ſhoulders, thighs, and legs, are ſomewhat lean. I found the winter hair to be two inches long, tolerably thick, as ſoft as camel hair, and of an iſabella-grey colour outwardly, but of a pale iron-grey towards the roots. The ſummer hair was ſcarcely three quarters of a line in length, here and there diſpoſed into circular vortices and ſhadings. A ſhading of the hair runs lengthwiſe along the face, and two others above the eyes. The vortices I obſerved firſt on each ſide of the mane immediately behind the ears. There were two alſo above each other under the neck; two on the ſides of the neck oppoſite the ſhoulders; a larger one on each joint of the ſhoulder; another large one on each ſide of the breaſt behind the ſhoulders, and alſo a cruciform ſhading of the hair. Several more of theſe hair vortices were formed on different parts of the body. The dſhiggetai is diſtinguiſhed particularly by the head, which has a mean proportion between that of the horſe and the aſs; and, in that reſpect, as well as by the ears and the tail, it approaches very near to the zebra. In the reſt of the body and the thighs it is more like the aſs; and in the limbs it has a greater ſimilarity to the mule and the horſe. Its colour and hair vortices are peculiar to itſelf. The ſtripe on the back, however, is like that of the female aſs, and of many horſes, without any croſs ſtripe. The tail excepted, it has, in general, the greateſt likeneſs to the mule. But, from the above circumſtances, it clearly appears that the dſhiggetai is an animal of a diſtinct genus, and as much peculiar to Aſia as the zebra and quagga are to Africa; whereas the aſs, and perhaps the horſe, in a wild ſtate, belong to both theſe quarters of the world in common."

3. *Equus Aſinus*, the Ass.—This animal, in the wild ſtate, has received from ancient and modern naturaliſts the name of *onager*. It is diſtinguiſhed by long flouching ears, a ſhort mane, and long hairs covering only the end of the tail. It is commonly aſh-coloured, with two black ſtreaks croſſing each other upon its ſhoulders. In youth, this animal is rather handſome in its ſhape, alert, and playful; but, as it advances in life, the tame aſs, either from the natural effects of age, or from ill treatment, loſes its ſprightlineſs, and becomes ſluggiſh, ſtubborn, and awkward. It attains its full growth in the fourth or fifth year, and lives, like the horſe, to the age of five-and-twenty or thirty years. The male is capable of procreation at the age of two years and an half, and the female ſtill earlier. Both ſexes are remarkably ſalacious: the male has been known to die immediately after covering; and the female is not eaſily brought to ſubdue the eagerneſs of her deſires: like the mare, ſhe is gravid 290 days. Her parental tenderneſs is not inferior to the ardour of her amorous diſpoſition: ſhe will accompany her young, or haſte to their relief, through the moſt formidable dangers; even flames and burning coals, are, on ſuch an occaſion, no obſtacle. She brings forth in a ſtanding poſture; and, ſeven days after delivery, again courts the embraces of the male. She produces but one colt; the inſtances of twins are very rare. The aſs ſleeps leſs than the horſe, and never lies down to repoſe, but after having ſuffered much fatigue. He is leſs ſubject to diſeaſes than the horſe. A ſmall quantity of food, and that of the coarſeſt kind, ſatisfies this animal. He does not deſpiſe even the thiſtle; but his favourite herb is the plantane. Like the horſe, he is capable of affection and attachment to his maſter. He diſtinguiſhes him among others; and ſeems even to diſcern him by the ſcent, when at ſome diſtance. His viſion is ſufficiently acute. His hearing is ſo remarkably delicate, that he is alarmed and frightened by the impulſe even of muſical ſounds. In the more ſouthern countries of Europe, and in the eaſt, where the aſs is ſtronger, more elegantly ſhaped, and more generous in his diſpoſitions, he is employed in more honourable ſervices, and kept for riding even by the rich and luxurious. The milk of the ſhe-aſs is eſteemed medicinal. It is chiefly for its milk that the aſs is valued in Britain. The ſkin being dry, hard, and elaſtic, is made into ſieves, drums, ſhoes, and parchment, which is laid over with a thin coat of fine plaſter, and uſed in pocket-books. By the nations of the eaſt, the leather called *ſagri* or *chagrin* is prepared from the ſkin of the aſs. The ancients made their

their beſt flutes of aſſes' bones. The Perſians uſe the bile of the aſs as a remedy againſt dimneſs of ſight.

The aſs appears to have been originally an eaſtern animal. In thoſe warm climates he appears to much greater advantage than in Europe, and other northern regions. In Senegal, it is actually conſpicuous for beauty: its hair is there of a gliſtering mouſe-colour; and the ſtreaks which croſs on its back and ſhoulders have a very agreeable effect. In Arabia, Egypt, Barbary, India, and Guinea, the aſs is remarkable for its ſize and ſtrength. The Indians of Madura believe that the ſouls of their nobility after death animate the bodies of aſſes; and, for that reaſon, treat the animal with peculiar reſpect. We learn from the *Chronicon Pretioſum*, that aſſes were known in England in the days of king Ethelred; and the animal is again noticed in the ſame record, under the reign of Henry III. Holingſhed relates, however, that, in the days of queen Elizabeth, there were no aſſes in the iſland: perhaps he may have been miſinformed; or the extinction of the race may have been owing to ſome accident. In Sweden, this ſpecies is extremely rare; and we know not if it has yet made its way into Norway.

The *onager*, or wild aſs of the ancients, which is called *koulan* by thoſe modern nations who have the beſt opportunities of being acquainted with it, is the ſame ſpecies, in a wild ſtate. The forehead of the koulan is very much arched: its ears ſtand always erect; they are lined with whitiſh curling hairs, and ſharp-pointed: its lips are thick; its noſtrils large and oval; and the end of the noſe ſlopes abruptly to the upper lip. It is taller than the domeſtic aſs; its legs are much more elegantly ſhaped; and it bears its head higher. Its ſkull is remarkably thin. Its mane is about three or four inches long, of a dun colour, ſoft, and woolly; and extending to the ſhoulders. The hairs at the end of its tail are coarſe, and about a ſpan long. The colour of its hair, in general, is a ſilver-white. The upper part of the face, the ſides of the neck, and the body, and the under part of the thighs, are flaxen. The fore-part of the body is divided from the flank by a white line, extending round the rump, to the tail. The legs and the belly are white. A ſtripe of waved, coffee-coloured, buſhy hairs, runs along the top of the back, from the mane to the tail. Another ſtripe of the ſame colour, croſſes the former at the ſhoulders. Two beautiful white lines, one on each ſide, bound the dorſal band, and the mane. In winter, the hair of this animal is ſoft, ſilky, and waving: it bears, in this ſtate, a conſiderable reſemblance to the hair of the camel; it feels greaſy; and the flaxen colour is, now, moſt exquiſitely bright. In ſummer, the hair is very ſmooth, ſilky, and even; but certain ſhaded rays, pointing downwards, mark the ſides of the neck.

The koulan inhabits the mountainous parts of the deſerts of Tartary; but is not found farther north than the forty-eighth degree of latitude. In ſummer, theſe animals appear in vaſt herds, in the neighbourhood of the lake Aral; but in winter, they retire to the warmer climate of India. Barboga, quoted by Dr. Pallas, relates, that they penetrate to the mountains of Malabar and Golconda. Perſia, however, is their favourite winter retreat; and they are found, through the whole year, on the mountains of Caſbin. The deſerts in the north of Africa are ſaid to afford wild aſſes of an aſh-colour. Anciently theſe animals were likewiſe found in Lycaonia, Phrygia, Meſopotamia, Sileſia, and Arabia Deſerta. They are remarkably wild. The Perſians, however, deceive theſe animals into pits, and by that means take them alive. They afterwards break them for the draught and the ſaddle; and value them highly for both theſe purpoſes. The breed of tame aſſes is improved by intermixture with theſe. The Romans eſteemed the progeny of the onager copulating with the tame aſs, by far the beſt. This animal is mentioned in the book of Job, as remarkable for its wild, impetuous, untameable, ſpirit. Like the wild horſe, and the dſhiggetai, this ſpecies aſſociate in herds, under a leader, and are very ſhy. They ſometimes, however, ſtop when running, in the midſt of their career, and ſuffer a perſon to approach them; but, before they can be caught, ſuddenly ſtart away, with great velocity.

The Tartars, and even the Perſians, eſteem the fleſh of the wild aſs a great delicacy. The former watch, and ſhoot it, when it goes to drink in the ponds of brackiſh water, in the deſerts; for it prefers ſaltiſh to freſh water, and is even fondeſt of ſaline and bitter milky plants. The Romans, among their other delicate diſhes, were very fond of the fleſh of the young of this animal, which they called *taliſio*; not leſs ſo, it would appear, than the Perſians and the Tartars.

The hybrid MULE is produced from the copulation of an horſe with a ſhe aſs; which ſort is diſtinguiſhed by the term *hinny*: and that produced from the contact of the male aſs with a mare is properly the mule, and theſe are conſidered as the beſt, being larger than thoſe whoſe male parent is the horſe. Their form bears a conſiderable reſemblance to that of the aſs; and in their diſpoſitions they are rather vicious and intractable. The Spaniſh mules are ſuperior to thoſe of other countries: very large ones are bred in Savoy. In Britain, a larger and ſtronger breed of mules has been obtained, by the importation of Spaniſh male aſſes for the purpoſe. In Spain, the mule is a favourite animal. It is well known to tread more firmly and ſecurely than the horſe. Perſons of quality in Spain prefer it, on this account, for drawing in their carriages. Pliny relates, as a fact authenticated by the public records of the Athenians, that a mule had been known to live to the age of eighty years. On the controverted ſubject of the impoſſibility of mules being able to *procreate*, and of the nature of hybrids in general, ſee the article MULE.

4. *Equus* ZEBRA, the ſtriped Horſe. The French hiſtorians, Briſſon and Buffon, call it *le zebre*, or *l'ane rayé*; from Linnæus it has received the name of *equus zebra*; by Kolben, in his account of its native country, it is called the *wild aſs*; and by the coloniſts at the Cape of Good Hope, they are called *wilde paarden*, or wild horſes. This beautiful animal is nearly of the ſame ſhape and ſize with the Spaniſh mule. Its tail, like that of the aſs, has long hairs at the extremity. The ſkin under the jaw is ſaid to hang looſe on the neck, in a manner which rather injures the general elegance of its appearance. Its mane is ſhort, and ſtands erect. The head, the neck, the mane, and the body, are ſtriped downwards, with lines of dark brown, on a light ground, or with alternate black and white lines. Its legs and thighs are ſtriped acroſs, with the ſame colours. This arrangement of its colours is univerſally admired. The males and females, excepting ſome trifling variations, are coloured alike.

This animal is remarkably ſwift. Kolben aſſerts, that he is ſwifter than the horſe; but Sparrman aſſures us, that, with good horſes, zebras are eaſily hunted down. Their feet are ſmall, and their hoofs hard; ſo that they may be regarded as ſurer-footed than horſes. Mankind have hitherto made but few attempts to tame this animal; and ſuch as they have made have proved unſucceſsful. The individuals of this ſpecies which have been brought into Europe, are remarkably wild and vicious. Buffon informs us, that the zebra which he examined was extremely wild; and though great pains had been uſed to tame him, yet ſtill he continued ſo unmanageable, that two men always held the bridle, while a third ſat on the animal's back. His ears were ſo exquiſitely ſenſible, that he kicked whenever they were touched. Pyrard, quoted by Buffon, relates, that, in Brazil, a zebra had been known to break looſe, and kill its keeper; yet zebras may hereafter, perhaps, be rendered as tame as horſes. Theſe animals are gregarious, and are ſeen in large troops. Their ſkins are procured by the European furriers, and ſold at a high price. Attempts have been repeatedly made to bring the zebra to copulate with the

aſs. In France, the experiment did not ſucceed: but in London, as Mr. Pennant informs us, the female zebra was covered by the male aſs. At firſt, ſhe refuſed with continued obſtinacy; but when the aſs was painted ſo as to reſemble herſelf, ſhe became complacent and paſſive. A hybrid zebra was accordingly produced; but which of the parents it chiefly reſembled, we have not been informed.

The zebra appears to be a native only of the African continent. The ſpecies abounds near the Cape. They are found, likewiſe, all along the country between the Cape and Ethiopia; and are alſo to be met with in Congo. They have been obſerved by travellers in Brazil, and in Perſia and Turkey; but thoſe muſt have been tranſported thither from the countries of which they are natives.

5. *Equus* QUAGGA. This ſpecies is called by Pennant, in his Hiſtory of Quaprupeds, *Quacha*; by Maſſon, in the Philoſophical Tranſactions, *Opeagha*; and by Sparrman, *Quagga*; which name has been adopted by Linnæus. This animal very nearly reſembles the zebra. It is of a ſmaller ſize, and its ears are ſhorter: it has no ſtripes on its fore legs, loins, or hinder parts. The flanks are ſpotted; the rump uniformly coloured; and the belly, legs, and thighs, are of a pure white. A tame quagga, which Dr. Sparrman ſaw at the Cape, was ſo pleaſed with the familiarity of mankind, that, inſtead of ſhunning thoſe who approached it, it came up to receive their careſſes. The quagga is much more tractable than the zebra, and is even yoked by the coloniſts at the Cape, in teams, with horſes. It is remarkable of the quagga, likewiſe, that notwithſtanding its being of a mild character, it is an overmatch for the hyæna; purſues that ferocious animal whenever it makes its appearance; and protects the horſes with whom it aſſociates from the hyæna's violence, from which they would otherwiſe ſuffer. The quagga, like the zebra, aſſociates in herds; and the ſpecies ſeems confined alſo to the regions of Africa. Edwards has miſtaken this animal for the female of the zebra; and, till very lately, the two genera were confounded by moſt African travellers.

6. *Equus Biſulcus*, the CLOVEN-FOOTED HORSE; an animal lately diſcovered by Molina, in his travels through Chili and Peru, in South America. This obſcure quadruped, frequents the precipitous and rocky mountains of the Andes or Cordelleras; in ſize, number and arrangement of teeth, and in general appearance, it reſembles the horſe, for which reaſon it is placed by Dr. Gmelin in this genus, though its cloven hoofs are ſimilar to thoſe of the ruminant claſs. It is a vicious, wild, and exceedingly ſwift, animal, having the ſize, hair, colour, noſe, eyes, neck, back, tail, legs, and genitals, reſembling the aſs, with which it likewiſe agrees in its internal ſtructure, but wants the duſky croſs or tranſverſe band over the ſhoulders, and reſembles the horſe in the figure of its ears, and the neighing ſound of its voice. It is ſingular that this curious ſpecies, which ſeems, as it were, to form a kind of link between the cloven-hoofed and whole-hoofed animals, ſhould have ſo long remained unknown to the naturaliſts of Europe.

ER, [ɐɹ and ɔɹ, Sax. *er*, Dut. and Ger. ερος, Gr. *er*, *ir*, *or*, and *ur*, Teut. or Lat.] the comparative termination of adjectives. Being added to verbs, it ſignifies the actor or doer, as *commander*, *fighter*, *walker*, &c. he who commands, fights, walks, &c.

ER, a ſyllable in the middle of names or places, comes by contraction from the Saxon ƿaɲa, dwellers. *Gibſon.*

E'RA, *ſ.* [*æra*, Lat.] The account of time from any particular date or epoch. See ÆRA, vol. i. p. 140.

E'RA, a river of Tuſcany, which runs into the Arno, fourteen miles above Piſa.

ERADIA'TION, *ſ.* [*e* and *radius*, Lat.] Emiſſion of radiance.—God gives me a heart humbly to converſe with him, from whom alone are all the *eradiations* of true majeſty. *King Charles.*

To ERA'DICATE, *v. a.* [*eradico*, Lat.] To pull up by the root.—He ſuffereth the poiſon of Nubia to be gathered, and aconite to be *eradicated*, yet this is not to be moved. *Brown.*—To completely deſtroy; to end; to cut off.—If vice cannot wholly be *eradicated*, it ought at leaſt to be confined to particular objects. *Swift.*

ERADICA'TION, *ſ.* The act of tearing up by the root; deſtruction; exciſion. The ſtate of being torn up by the roots.—They affirm the roots of mandrakes give a ſhriek upon *eradication*, which is falſe below confutation. *Brown.*

ERA'DICATIVE, *adj.* That which cures radically; that which drives quite away.

ERACLIS'SA HEXAGYNA of Forſkahl. The ſame with ANDRACHNE telephoides.

ERAGROS'TIS, *ſ.* in botany. See BRIZA.

E'RAN, [Heb. their enemy.] A man's name. The ſon of Shuthelah, head of the Eranites. *Numb.* xxvi. 36.

ERANAR'CHA, *ſ.* a public officer among the ancient Greeks, whoſe buſineſs was to preſide over and direct the alms and proviſions made for the poor. Cornelius Nepos, in his life of Epaminondas, deſcribes his office thus: When any perſon was reduced to poverty, taken captive, or had a daughter to marry, which he could not effect for want of money, &c. the eranarcha called an aſſembly of friends and neighbours, and taxed each according to his means and eſtate, to contribute towards his relief.

E'RANG, a town of the iſland of Ceram.

ERANGE'LIA, *ſ.* in botany. See GALANTHUS.

ER'ANITE, *ſ.* A deſcendant of Eran.

ERAN'THEMUM, *ſ.* [from ερα, the earth, and ανθος, Gr. a flower.] In botany, a genus of the claſs diandria, order monogynia, natural order aggregatæ, (vitices, *Juſſ.*) The generic characters are—Calyx: perianthium five-cleft, tubular, very narrow, upright, ſhort, acuminate, permanent. Corolla: one-petalled, funnel-form; tube filiform, extremely long; border five-parted (four-parted ſometimes,) flat; diviſions obovate. Stamina: filaments two, very ſhort, in the mouth of the corolla; antheræ ſubovate, compreſſed, beyond the tube. Piſtillum: germ ovate, very ſmall; ſtyle filiform, length of the ſtamens; ſtigma ſimple.—*Eſſential Character.* Corolla five-cleft, with a filiform tube; antheræ beyond the tube; ſtigma ſimple.

Species. 1. Eranthemum Capenſe, or Cape earth-flower: leaves lanceolate-ovate petioled. 2. Eranthemum anguſtifolium, or rough-leaved earth-flower: leaves linear, remote, patulous. 3. Eranthemum parvifolium, or ſmall-leaved earth-flower: leaves ovate linear, imbricate. 4. Eranthemum ſalſoloides, or ſalſola earth-flower: leaves fleſhy, nearly columnar, linear, very ſmooth; racemes axillary, they and the calyxes pubeſcent; tube bent back. 5. Eranthemum ſpinoſum, or prickly earth-flower: leaves ovate, oppoſite; ſtipules ſpiny; flower ſolitary, lateral. They are all underſhrubs or herbs, natives of the Cape of Good Hope. Leaves oppoſite or alternate; flowers in terminating ſpikes.

To ERA'SE, *v. a.* [*raſer*, Fr.] To deſtroy; to exſcind.—The heads of birds, for the moſt part, are given *eraſed*; that is, plucked off. *Peacham on Blazoning.*—To expunge; to rub out.

ERA'SEMENT, *ſ.* Deſtruction, devaſtation; extinction, abolition.

ERASE'NUS, a river of Peloponneſus, flowing for a little ſpace under the ground in Argolis. *Ovid.*

ERASIS'TRATUS, an ancient Greek phyſician, a native of Sicyon, and grandſon of Ariſtotle. He was in high profeſſional reputation in the reign of Seleucus Nicanor, who conſulted him concerning the illneſs of his ſon Antiochus, which Eraſiſtratus by his ſagacity diſcovered to be occaſioned by love for his mother-in-law, Stratonice. He was rewarded with one hundred talents on this occaſion. He is called by Galen the reviver of anatomy; and he, as well as Herophilus, is charged with the cruelty of diſſecting criminals alive, ſupplied to him by Antiochus.

He

He made a number of anatomical diſcoveries, which have been confirmed by modern obſervations. He was an enemy to blood-letting; and in medical practice he preferred ſimples of the milder kind, and taken from the vegetable kingdom. He was an enemy to empiriciſm, and held, that a diſorder could not be cured without a knowledge of its cauſe. Eraſiſtratus wrote a number of books, all which have periſhed; but many of his opinions are recorded by Galen and Cælius. He founded a ſect which was ſubſiſting in the time of Galen.

ERAS'MUS, [from ερασμος, Gr. amiable; lovely.] A proper name of men.

ERAS'MUS (Deſiderius), a perſon eminent for learning, born at Rotterdam in 1467. He was ſent to ſchool at Deventer when nine years of age, and ſoon exhibited quick parts, and particularly that ſtrength of memory which is ſo eſſential to a ſcholar. He was left an orphan in the care of three guardians, who agreed to bring him up to a religious life, in order the more eaſily to embezzle his ſmall patrimony. In conformity with the pedantic taſte then prevailing among men of letters, of aſſuming names of Greek or Latin etymology, he tranſlated his family name of *Gerard*, ſignifying *amiable*, into the equivalent ones of *Deſiderius* in Latin, and *Eraſmus* in Greek. He uſed both of theſe; but the latter became his perpetual appellation. His conſtitution was delicate, and ill ſuited to monaſtic auſterities, nor were his taſtes and ſentiments better accommodated to the monkiſh profeſſion; he therefore, with permiſſion of his ſuperiors, accepted, in his twenty-third year, an invitation to reſide with the archbiſhop of Cambray. Thence he went to Paris, and became a ſtudent in the college of Montaigue. For his ſupport he gave private lectures; but he paſſed ſome years of his life in that penury which ſtimulated him to great exertions, and gave him thoſe habits of induſtry which raiſed him to eminence. Among his pupils at Paris were ſome Engliſhmen, whoſe liberality induced him to viſit their country. He was in England in 1497, where he contracted many valuable friendſhips. The works by which he was firſt known were of the philological kind, calculated to aſſiſt ſtudents in the learned languages. Of theſe were his *De Copia Verborum & Rerum*, *De Ratione Conſcribendi Epiſtolas*, and many others. In 1503, he printed at Louvain ſome works of the theological kind, particularly his *Enchiridon Militis Chriſtiani*, a kind of manual of practical religion, written with a manly and rational ſpirit, much ſuperior to the punctilious devotion of the cloiſter. It underwent ſome cenſure from the monks, but was much read, and was tranſlated into ſeveral modern languages. About this time too, he prefixed to a tranſlation of ſeveral dialogues of Lucian, a dedication, in which he freely expoſed the legendary fables of the early Chriſtians. In his fortieth year he viſited Italy, took his doctor's degree at Turin, and ſtaid about a year at Bologna; thence he went to Venice, and printed an improved edition of his *Adagies*; he ſpent the winter of 1508 at Padua, and went to Rome the year following. He received a preſſing invitation to England from Henry VIII. who had contracted a friendſhip for him while prince. He accepted the invitation, and came over at the beginning of 1510, and was in great favour with the king and Wolſey. He firſt lodged with ſir Thomas More, and amuſed himſelf with writing his *Moriæ Encomium*; or, Praiſe of Folly: a facetious and ſatirical compoſition, which became popular. At the requeſt of Fiſher biſhop of Rocheſter, chancellor of Cambridge, Eraſmus went to that univerſity, and read lectures in Greek and divinity. A living was conferred upon him, and he received preſents from many of his patrons; but, upon the whole, his expectations in this kingdom were not gratified. He returned to the Low Countries in 1514, and viſiting the court of the archduke Charles (afterwards Charles V.), was created nominal counſellor to that prince, with a ſtipend. He paid a viſit to the town of Baſil, where he formed that intimacy with the learned family of Amberbach, and with the printer Froben, which induced him to ſpend his latter days in that place. In 1516, his New Teſtament, in Greek and Latin, with notes, was publiſhed at Baſil, and was received with great avidity by all who were deſirous of ſtudying theology in its original and genuine ſources. It was dedicated to pope Leo X. His edition of St. Jerom alſo appeared this year, dedicated to his excellent and generous patron archbiſhop Warham. An offer was made to him on the part of Francis I. to ſettle in France; but his connections with Charles V. induced him to decline it. Among the meritorious ſentiments of Eraſmus may be reckoned his perpetual oppoſition to war, which he thought ſcarcely lawful to a Chriſtian. He has dwelt upon this topic in many of his works, eſpecially in his eloquent *Querela Pacis*, printed in 1517.

The commencement of the reformation under Luther was the moſt trying circumſtance in the life of Eraſmus. No man had done ſo much as he to diſcredit the frauds and ſuperſtitions of popery, and to place Chriſtianity upon its proper foundation. The monks were ſo ſenſible of this, that they were uſed to ſay, "Eraſmus laid the egg, and Luther hatched it." Yet there were ſeveral reaſons which prevented him from joining the reformers. He was likewiſe offended with the rudeneſs, vulgarity, and contempt of polite literature, which characteriſed ſome of the claſs. Yet he did enough to merit the eternal gratitude of all candid friends to light and liberty, by the example he never ceaſed to give of free enquiry, and the perpetual war he waged againſt perſecution, ignorance, and bigotry. For ſome years Eraſmus treated Luther with great deference, and in his letters to various perſons defended his character and applauded his intentions. In proceſs of time, however, Eraſmus, irritated at ſome attacks upon him by the zealous reformers, took his part among the defenders of the church of Rome.

In 1522, he publiſhed the moſt popular of his works, his *Colloquies*, which, though apparently intended for the inſtruction of youth in the Latin language, and commencing with dialogues of great ſimplicity, abound in ſolid and liberal ſentiments on the moſt important topics, and attack the prevalent ſuperſtitions with ſerious argument and humorous ſarcaſm. After having been long urged by his catholic friends and patrons to write againſt Luther, he at length, with manifeſt unwillingneſs, undertook the taſk, and in 1524 publiſhed his treatiſe *De Libero Arbitrio*. As in this work he profeſſedly attacked only Luther's opinion concerning predeſtination, it might be ſuppoſed that he did not mean to condemn his diſſent from the church of Rome in other points. In 1528, he publiſhed his dialogue, entitled *Ciceronianus*, one of the moſt lively and ingenious of his compoſitions. In the ſame year he alſo publiſhed his learned treatiſe *De Recta Latini Græcique Sermonis Pronuntiatione*; and thus ſeems to have been deſirous of diverting his mind from the dangerous diſputes of theology. He continued his learned labours without intermiſſion, though under the preſſure of many infirmities; and cloſely attended the printing of his treatiſe, *Eccleſiaſtes*; or, On the Manner of Preaching. At this time there was an intention at Rome to add Eraſmus to the college of cardinals; but it was now too late to burthen him with ſo ſplendid a promotion. His health had rapidly declined; a dyſentery exhauſted his remaining ſtrength; and he calmly expired on July 12, 1536, at the age of ſixty-nine, in the arms of his deareſt friends, who were proteſtants, and after having preferred pious addreſſes to God and Chriſt, to all the dying ceremonials enjoined by the Romiſh ritual. His body was interred with great funeral ſolemnity in the cathedral church of Baſil, where his tomb is ſtill to be ſeen. His works were collected and publiſhed by Froben, in nine volumes folio.

ERAS'MUS, a mountain of the iſland Ceylon: thirty miles north-weſt of Trincomalee.

ERAS'TIANS, *ſ.* a religious faction, which aroſe in England during the time of the civil wars in 1647, thus called from their leader Thomas Eraſtus, whoſe diſtin-

guiſhing doctrine was, "that the church had no right to diſcipline, no regular power to excommunicate, exclude, cenſure, abſolve, decree, or proſecute," all ſuch power being in the civil magiſtrate.

ER'ATO, one of the muſes, who preſided over lyric, tender, and amorous, poetry. She is repreſented as crowned with roſes and myrtle, holding a lyre in her hand. She appears with a thoughtful and ſometimes with a gay and animated look. She was invoked by lovers, eſpecially in the month of April, which, among the Romans, was more particularly devoted to love. *Apollodorus.*

ERATOS'THENES, an eminent Greek philoſopher, mathematician, and chronologiſt, born at Cyrene, in the ſecond year of the 126th olympiad, or 275 before Chriſt. So diſtinguiſhed was he for his proficiency in different branches of erudition, that he acquired the ſurname of πεντάθλος, or victorious in five conteſts, which, under an alluſion to the five prizes of the Olympic games, was meant to deſignate his ſucceſs and ſuperiority in all kinds of literary purſuits. On the invitation of Ptolemy Euergetes, he quitted Athens, and went to Egypt, in order to undertake the office of librarian to the celebrated library at Alexandria. In that ſituation he continued under the reigns of three ſucceſſive princes, diſcharging the truſt committed to him with great applauſe, and acquiring a high reputation for ſcience and learning by the many books which he wrote, and the diſcoveries which he announced. He was the firſt who found out a method of meaſuring the periphery of the earth; and he alſo obſerved the obliquity of the ecliptic. He wrote an epiſtle to king Ptolemy, in which he ſolved the problem of the duplication of the cube; and he invented a convenient method of diſcovering the primary numbers, that is, ſuch as have no common meaſure of diviſion *inter ſe*, excepting unity, which has been called the ſieve of Eratoſthenes. He wrote numerous treatiſes in grammar, aſtronomy, hiſtory, and geography, together with dialogues on the philoſophical ſects, and poems. Nothing more than fragments, however, of his different pieces have reached our times, ſome of which were publiſhed at Oxford in 1672, with brief annotations, in 8vo. The moſt valuable of his remains, which is not in that little collection, is his Catalogue of the Kings of Thebes, in Egypt, from Menes, who firſt peopled Egypt after the Deluge, to the Time of the Trojan War. It is one of the moſt venerable and authentic monuments of antiquity now extant, and contains a ſeries of thirty-eight kings, reigning in a direct line of ſucceſſion, taken not only from the records in the Alexandrian library, but the ſacred archives in Dioſpolis, or Thebes, and moſt probably drawn up to ſupply the defects, and correct the errors, of Manetho's Dynaſties. By ſome of our ableſt chronologers it has been conſidered and made uſe of as an authority of the firſt importance in ſettling the Egyptian chronology. Eratoſthenes died at the advanced age of eighty-one. The fragments of his works which are noticed above to have been publiſhed at Oxford, were alſo printed in Uranologium of Petavius, at Paris, in 1630, and afterwards at Amſterdam, in 1703.

ERATOS'TRATUS, an Epheſian who burnt the famous temple of Diana the ſame night that Alexander the Great was born. Eratoſtratus committed this act of villainy merely to eternize his name. *Plutarch.*

ERAVIN'SKOI, a fortreſs of Ruſſia, in the government of Irkutſch: eighty miles ſouth-ſouth-eaſt of Barguzinſk. Lat. 52. 32. N. lon. 129. E. Ferro.

ER'BACH, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz, on the Rhine: eleven miles weſt of Mentz.

ER'BACH, a town of Germany, in the circle of Franconia, and capital of a county of the ſame name: twenty miles north-eaſt of Manheim, and ſixteen north-north-eaſt of Heidelberg.

ER'BACH (County of), a principality of Germany, in the circle of Franconia, about ſeven leagues long, and ſix wide: the ſoil is mountainous, but produces enough to ſupply the wants of the inhabitants. The inhabitants make a large quantity of pot-aſh, and feed a great number of cattle: it contains mines of lead, ſilver, iron, copper, and quickſilver: the number of inhabitants is eſtimated at 23,000 or 24,000, who are chiefly Lutherans. The articles of commerce which they export are ſpelt, oats, wheat, cattle, wood, pot-aſh, honey, wax, iron, and charcoal. The counts are hereditary cup-bearers to the elector palatine. The aſſeſſment for the Roman month is forty florins, and the tax for the chamber at Wetzlar twenty-ſeven rixdollars.

ER'BAT, a town of Aſiatic Turkey, in the province of Diarbekir: fifty-eight miles ſouth-eaſt of Diarbek.

ER'BAZ, a town of Aſiatic Turkey, in the province of Natolia: thirty-ſix miles weſt-ſouth-weſt of Degnizlu.

ER'BLSPACH, or ERWOLTSPACH, or ERLSBACH, a town of Germany, in Lower Bavaria: twelve miles weſt-north-weſt of Dingelfingen, and thirty-four eaſt-ſouth-eaſt of Ingoldſtadt.

ER'CE, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the diſtrict of Bain: five miles eaſt of Bain.

ER'CHEE, a town of Perſia, in the province of Adirbeitzan: ſixty miles eaſt-north-eaſt of Tauris.

ERCIL'LA Y ZUNIGA (Don Alonzo de), an eminent Spaniſh poet, born at Madrid in 1533. He was early in life made page to the infant don Philip, whom he attended in his progreſs through the Low-countries, and part of Germany and Italy He afterwards accompanied Philip when he went to England to celebrate his marriage with queen Mary. He was afterwards engaged in the war with the Araucanians, whoſe courage and love of liberty he ſeems greatly to have admired, though his military duty obliged him to uſe his beſt efforts in ſubduing them. The intereſting ſcenes to which he was witneſs called forth his poetical powers, and he employed the intervals of leiſure in recording them in heroic verſe. He compoſed, as it were, with the ſword in his hand, and the earlier parts of his poem were written upon ſcraps of leather for want of paper. The "Araucana" is rather an hiſtorical poem than a proper epopœa, as it is a narrative of real events, only interſperſed with fabulous circumſtances. It was publiſhed in three parts: the two firſt in 1577 and 1578, the whole complete in 1590. Mr. Hayley, in his Eſſay on Epic Poetry, and the notes attached to it, has taken much pains to make Ercilla advantageouſly known to the Engliſh reader, by tranſlations of ſelect parts, and an analyſis of the whole.

ERDE'NI-TCHAO, a town of Chineſe Tartary, in the country of the Eluths: 680 miles north-weſt of Peking. Lat. 46. 58. N. lon. 120. 30 E. Ferro.

ER'DER, a town of Germany, in the circle of Weſtphalia, and county of Lippe: twelve miles north-north-eaſt of Lemgow.

ERD'MANSDORF, a town of Germany, in the circle of Upper Saxony, and circle of Erzgeburg: five miles eaſt of Chemnitz.

ERE, *adv.* [æꝛ, Sax. *air*, Gothic; *err*, Dutch. This word is ſometimes vitiouſly written *e'er*, as if from *ever*. It is likewiſe written *or* before ever, oꝛ and æꝛ in Saxon being indiſcriminately written. Mr. *Lye.*] Before; ſooner than.—*Ere* he would have hang'd a man for the getting a hundred baſtards, he would have paid for the nurſing a thouſand. *Shakeſpeare.*—The lions brake all their bones in pieces *or ever* they came to the bottom of the den. *Daniel.*

The birds ſhall ceaſe to tune their ev'ning ſong,
The winds to breathe, the waving woods to move,
And ſtreams to murmur, *ere* I ceaſe to love. *Pope.*

ERE, *prep.* Before:

Our fruitful Nile
Flow'd *ere* the wonted ſeaſon. *Dryden.*

EREBIN'THUS, *ſ.* in botany. See GALEGA.

E'REBUS, [ἔρεβος, Gr. from ערב, Heb. night.] In mythology,

thology, a term denoting darkneſs. According to Heſiod, Erebus was the ſon of Chaos and the Night, and the father of the Day. This was alſo the name of part of the *inferi* among the ancients. Erebus properly ſignified the gloomy region, and was diſtinguiſhed both from Tartarus the place of torment, and from Elyſium the region of bliſs: according to Virgil, it forms the third grand diviſion of the inviſible world beyond the Styx, and comprehends ſeveral imaginary diſtricts, as the *limbus infantum*, or receptacle for infants; the *limbus* for thoſe who have been put to death without cauſe: that for ſuch as deſtroyed themſelves; the fields of mourning, full of dark groves and woods, inhabited by thoſe who died for love; and beyond theſe, an open champaign country for departed heroes.

E'RECH, one of the primitive kingdoms of the world, founded by Nimrod in the land of Shinar. *Gen.* x. 10.

EREC'THEUS, king of Athens, and the ſixth from Cecrops, ſucceeded his father Pandion about 1399 before Chriſt. He was the moſt powerful Grecian prince of his time. Among his children was a daughter, Orithyia, who is fabled to have been forcibly carried away by the wind Boreas, which is with probability interpreted to refer to her rape by a Thracian king. In his reign the Athenians were inſtructed by a ſtranger in the cultivation of corn, whence Ceres is ſaid to have viſited Athens at that period. Erectheus, after a reign of fifty years, was ſlain in a battle againſt the Eleuſians.

To ERE'CT, *v. a.* [*erectus*, Lat.] To raiſe in a ſtraight line; to place perpendicularly to the horizon.

To ERECT *a Perpendicular.* To croſs one line by another at right angles. To raiſe; to build:

Happier walls expect,
Which, wand'ring long, at laſt thou ſhalt *erect*. *Dryden.*

To eſtabliſh anew; to ſettle.—He ſuffers ſeventy-two diſtinct nations to be *erected* out of the firſt monarchy under diſtinct governors. *Raleigh.*—To elevate; to exalt.—I, who am a party, am not to *erect* myſelf into a judge. *Dryden.*—I am far from pretending infallibility: that would be to *erect* myſelf into an apoſtle. *Locke.*—To raiſe conſequences from premiſes.—From fallacious foundations and miſapprehended mediums, men *erect* concluſions no way inferrable from the premiſes. *Brown.*—To animate; not to depreſs; to encourage:

Why ſhould not hope
As much *erect* our thoughts, as fear deject them? *Denham.*

To ERE'CT, *v. n.* To riſe upright.—The trefoil againſt rain ſwelleth in the ſtalk, and ſo ſtandeth more upright; for by wet, ſtalks do *erect*, and leaves bow down. *Bacon.*

ERE'CT, *adj.* [*erectus*, Lat.] Upright; not leaning; not prone.—Baſil tells us that the ſerpent went *erect* like man. *Brown.*—Directed upwards:

Vain were vows,
And plaints and ſuppliant hands, to Heav'n *erect*. *Philips.*

Bold; confident; unſhaken:

Let no vain fear thy gen'rous ardour tame;
But ſtand *erect*, and ſound as loud as fame. *Glanville.*

Vigorous; not depreſſed.—That vigilant and *erect* attention of mind, which in prayer is very neceſſary, is waſted or dulled. *Hooker.*

EREC'TION, *ſ.* The act of raiſing, or ſtate of being raiſed upward.—We are to conſider only the *erection* of the hills above the ordinary land. *Brerewood.*—The act of building or raiſing edifices.—Pillars were ſet up above one thouſand four hundred and twenty-ſix years before the flood, counting Seth to be an hundred years old at the *erection* of them. *Raleigh.*—Eſtabliſhment; ſettlement.—It muſt needs have a peculiar influence upon the *erection*, continuance, and diſſolution, of every ſociety. *South.*—Elevation; exaltation of ſentiments.—Her peerleſs height my mind to high *erection* draws up. *Sidney.*—Act of rouſing; excitement to attention.—Starting is an apprehenſion of the thing feared, and in that is a ſhrinking, and likewiſe an inquiſition what the matter ſhould be; and in that it is a motion of *erection*: ſo that when a man would liſten ſuddenly he ſtarteth; for the ſtarting is an *erection* of the ſpirits to attend. *Bacon.*

ERECT'NESS, *ſ.* Uprightneſs of poſture or form.—We take *erectneſs* ſtrictly as Galen defined it: they only, ſayeth he, have an erect figure, whoſe ſpine and thigh-bone are carried on right lines. *Brown.*

EREC'TOR, *ſ.* [from *erigo*, Lat. to lift up.] A muſcle of the penis, whoſe office it is to raiſe or lift it up.—See ANATOMY, vol. i. p. 620.

ER'EGEM, a town of Flanders: ten miles ſouth-weſt of Bruges.

EREK'LI, a town of Aſiatic Turkey, in the province of Caramania: ſixty miles eaſt of Cogni.

ERELO'NG, *adv.* Before a long time had elapſed. *Nec longum tempus.*—Nothing is laſting that is feigned: it will have another face than it had *erelong*. *Ben Jonſon.*

They ſwim in joy,
Erelong to ſwim at large, and laugh, for which
The world *erelong* a world of tears muſt weep. *Milton.*

EREMEG'IKE, a town of Aſia, in Thibet: twenty-five miles ſouth of Tourfan.

E'REMITE, *ſ.* [*eremita*, Lat. ερημος, Gr.] One who lives in a wilderneſs; one who lives in ſolitude; an hermit; a ſolitary; we now ſay *hermit*:

Embryoes and ideots, *eremites* and friars,
White, black, and grey, with all their trumpery. *Milton.*

EREMI'TICAL, *adj.* Religiouſly ſolitary; leading the life of an hermit.—They have multitudes of religious orders, *eremitical* and cenobitical. *Stillingfleet.*

ERENOW', *adv.* Before this time.—Had the world eternally been, ſcience had been brought to perfection long *erenow*. *Cheyne.*

Ah, gentle ſoldiers, ſome ſhort time allow;
My father has repented him *erenow*. *Dryden.*

EREPTA'TION, *ſ.* [*ereptio*, Lat.] A creeping forth.

EREP'TION, *ſ.* [*ereptio*, Lat.] A ſnatching or taking away by force.

E'RES, or ERIS, a town of Perſia, in the province of Sceirvan, on the borders of Armenia; falling to decay: eighty miles ſouth-weſt of Derbend, and 120 ſouth eaſt of Teflis.

ERE'SIA, *ſ.* in botany. See THEOPHRASTA.

ERES'MA, a river of Spain, which runs into the Duero, between Simancas and Tordeſillas.

ERE'SUS, a town of Leſbos, where Theophraſtus was born.

ERE'TRIA, a city of Eubœa on the Euripus, anciently called Melaneis and Arotria. It was deſtroyed by the Perſians, and the ruins were hardly viſible in the age of Strabo. It received its name from Eretrius, a ſon of Phaeton.

ERE'TUM, a town of the Sabines near the Tiber, whence came the adjective Eretinus.

ERETHIS'MUS, *ſ.* [from ερεθιζω, Gr. to irritate.] An irritation of the inteſtines from thin acrimonious humours.

EREUX'SIS, *ſ.* [from ερευγω, to eructate.] Eructation, or flatulence in the ſtomach.

EREWHI'LE, or EREWHILES, *adv.* Some time ago; before a little while.—We ſit down to our meals, ſuſpect not the intruſion of armed uninvited gueſts, who *erewhiles* we know were wont to ſurpriſe us. *Decay of Piety.*

I am as fair now as I was *erewhile*:
Since night you lov'd me, yet ſince night you left me. *Shakeſ.*

ER'FA, a town of the iſland of Corſica: twenty-five miles north-north-weſt of Baſtia.

ER'FURT, or ERFORT, a city of Germany, in the circle of the Lower Rhine, founded in the fifth century; belonging to the elector of Mentz, who governs it by a ſtadtholder. It has an eccleſiaſtical, a civil, and criminal, tribunal;

tribunal; and a regency, from whence appeals may be made to the elector. The municipality is compoſed of an equal number of Catholics and Lutherans. The town is large, but not populous, the buildings in general in the Gothic ſtyle; ſituated on the Gera, fortified, and defended by two caſtles, with a garriſon of imperial and electoral troops. It contains, beſides a college, a mitred abbey, and ſeven others, four pariſh churches and three chapels for the Roman Catholics, and eleven churches for Lutherans, and an academy inſtituted for uſeful ſcience; a well furniſhed library, in which are ſeveral manuſcript Bibles in the Hebrew characters; and an univerſity, compoſed of five colleges, whoſe profeſſors are Roman Catholics and Lutherans. The territory of Erfurt is fertile, but wants wood: it contains, beſides the capital, two towns, and ſeventy-three villages: 110 miles weſt of Dreſden, and 160 eaſt of Cologne. Lat. 50. 50. N. lon. 28. 37. E. Ferro.

ER'GANE, a river whoſe waters were fabled to intoxicate as wine.—A ſurname of Minerva. *Pauſanias.*

ERGE'NE, a river of European Turkey, which runs into the Mariza, near Demotica, in Romania.

ER'GERS, a river of France, which runs into the Ill, about two miles eaſt from Griſpoltheim, in the department of the Lower Rhine.

ERGI'NUS, a king of Orchomenos, ſon of Clymenes. He obliged the Thebans to pay him a yearly tribute of 100 oxen, becauſe his father had been killed by a Theban. Hercules attacked his ſervants, who came to raiſe the tribute, and mutilated them, and he afterwards killed Erginus, who attempted to avenge their death by invading Bœotia with an army. *Pauſanias.*—A river of Thrace. *Mela.*—One of the four brothers who kept the Acrocorinth, by order of Antigonus. *Polyænus.*

ER'GOT, *ſ.* A ſort of ſtub, like a piece of ſoft horn, about the bigneſs of a cheſnut, which is placed behind and below the paſtern joint of a horſe, and is commonly hid under the tuft of the fetlock.

E'RIACH, *ſ.* [Iriſh] Recompence for murder.—The *Brehon*, that is their judge, will compound between the murderer and the friends of the party murdered, which proſecute the action, that the malefactor ſhall give unto them, or to the child or wife of him that is ſlain, a recompence, which they call an *eriach. Spencer's Ireland.*

ERIAM'BO, a river of Ruſſia, which runs into the Oby, thirty miles above Obdorſkoi.

ERI'CA, *ſ.* [ἐρείκω, Gr. to break; from its ſuppoſed quality of breaking the ſtone in the bladder.] HEATH; in botany, a genus of the claſs octandria, order monogynia, natural order of bicornes, (ericæ, *Juſſ.*) The generic characters are—Calyx: perianthium four-leaved; leaflets ovate-oblong, permanent. Corolla: one-petalled, bell-form, four-cleft, often bellied. Stamina: filaments eight, capillary, inſerted into the receptacle; antheræ two-cleft at the tip. Piſtillum: germ roundiſh, ſuperior; ſtyle filiform, upright, longer than the ſtamens; ſtigma crowned, four-cornered, four-cleft. Pericarpium: capſule roundiſh, ſmaller than the calyx, covered, four-celled, four-valved; partitions meeting with the ſutures, (oppoſite to the ſutures, *G.*) Seeds: numerous, very ſmall.—*Eſſential Character.* Calyx four-leaved; corolla four-cleft; filaments inſerted into the receptacle; antheræ cloven; capſule four-celled.

Deſcription. Heaths are ſmall ſhrubs, or what are commonly called underſhrubs *(ſuffrutices).* Their leaves are very ſmall, linear, lanceolate or ovate, imbricate or remote, entire, ciliate or ſerrate, in ſome oppoſite, in moſt whorled, in others again ſcattered. Bractes uſually three, two of which are oppoſite. The flowers are either axillary or terminating, and variouſly diſpoſed. Corolla moſtly of a purple colour. Antheræ commonly oblong, but ſometimes linear. Germ in moſt ſpecies ſmooth. In ſome ſpecies the antheræ are awned, in others creſted, in others awnleſs; in ſome they are included within the corolla, in others they are projected, or ſtand out beyond the corolla. Hence this unwieldy genus is commodiouſly divided into four ſections; and theſe are ſubdivided into ſubordinate ſections from the diſpoſition of the leaves. The incluſion or projection of the ſtyle alſo affords another diviſion of the ſpecies. The calyx in ſome is double. And, laſtly, the form of the corolla aſſiſts us much in diſtinguiſhing the numerous ſpecies. The campanulate and ovate forms, with their ſeveral modifications, are the predominating ones. This genus has within the compaſs of a few years riſen from neglect to ſplendour. Every one remembers that Mr. Pope marks it with contempt, at the ſame time that he celebrates the colour of the flowers: "E'en the wild heath diſplays its purple dyes." Mr. Miller, ſo late as the year 1768, makes mention of no more than five ſorts, four of which, as being wild, he conſigns to oblivion; the fifth, our No. 17, is an inhabitant of the ſouth of Europe; but he has not one of thoſe beautiful natives of the Cape of Good Hope, which now form ſo great an ornament to our green-houſes or dry ſtoves. In Linnæus's Species Plantarum, 1762, we have thirty-eight ſorts; in Dahlgren's Diſſertation, 1770, there are fifty-eight; which are increaſed to ſeventy-four in Murray's edition of Syſtema Vegetabilium, 1784. From Bergius, the Supplement, &c. and to ninety-one in Thunberg's Diſſertation on this genus, publiſhed the year following. Our liſt, by the aſſiſtance principally of the Hortus Kewenſis, contains eighty-three ſpecies. Our firſt acquaintance with the African heaths is from Hermann and Oldenland, towards the end of the laſt century. The latter of theſe authors enumerates twenty-ſix ſpecies.

Ray, in his Hiſtory, 1688, enumerates fifteen ſorts, which are chiefly our wild ones, and thoſe from the ſouth of Europe; he has only one African in this liſt: in his Dendrologia, however, 1704, he has a long catalogue of fifty-ſix African heaths, from Petiver and Plukenet, but chiefly from Sherard. This is a mere enumeration of names; and heaths continued to be little known, except from the dried ſpecimens in the herbariums of the curious, till ſome of the European ſpecies were imported into our gardens between the years 1763 and 1770; and the rich harveſt of Africans were introduced from the Cape of Good Hope, by Mr. Francis Maſſon, who made two voyages to that ſpot, ſo abundant in rare plants, by the command and at the expence of the king of Great Britain; firſt in the years 1773, 1774, and 1775; and again in the years 1786 and 1787. Since theſe two periods, no genus of plants has attracted more regard than that which is now to be deſcribed.

Species. I. Antheræ awned, leaves oppoſite. 1. Erica vulgaris, or common heath: corollas bell-ſhaped, almoſt equal; calyxes double, (the inner longer than the corolla;) leaves ſagittate, (imbricate in four rows, *St.*) Common heath is a foot or two in height, or more; the ſtems brown and woody, very much branched; the branches in oppoſite pairs, moſtly upright, round, downy, and reddiſh; the branchlets ſquare. Leaves nearly ovate, bluntiſh, with a whitiſh furrow, ſlightly hairy at the edge; according to Lightfoot tetragonal, in four imbricate rows, the uppermoſt having angles at the baſe like the barbs of an arrow. Flowers ſolitary, on peduncles the length of the leaves, from the ſides of the branches, ſlightly nodding, oppoſite, but generally pointing one way, giving the branches the appearance of long bunches, but leafy ſhoots will be always found at the end. Seeds ſix to nine in each cell, ſub-ovate, ſcrobiculate-wrinkled, pale yellow.

This plant, which is little regarded in warmer climates, is made ſubſervient to a great variety of purpoſes in the bleak and barren highlands of Scotland, and other northern countries. The poorer inhabitants cover their cabins with it inſtead of thatch, or elſe twiſt it into ropes, and bind down the thatch with them in a kind of lattice work; they alſo make the walls with alternate layers of heath, and a ſort of cement made of black earth and ſtraw. The hardy Highlanders frequently make their beds with it. In moſt of the weſtern iſles they dye their yarn of a yellow

yellow colour, by boiling it in water with the green tops and flowers of this plant: and woollen cloth boiled in alum-water, and afterwards in a ſtrong decoction of the tops, comes out a fine orange-colour. In ſome of theſe iſlands they tan their leather in a ſtrong decoction of it. Formerly the young tops are ſaid to have been uſed alone to brew a kind of ale; and Boethius relates that this liquor was much uſed by the Picts. In ſome of the iſles, it is ſaid, they ſtill brew ale with one part malt, and two parts of the young tops of heath, ſometimes adding hops. In many parts of Great Britain beſoms are made of it. The turf, with the heath growing on it, is cut up and dried for the fuel of the cottager, for heating ovens, covering under-ground drains, &c. Sheep and goats will ſometimes eat the tender ſhoots, but they are not fond of them. Cattle not accuſtomed to browſe on heath give bloody milk, but are ſoon cured by drinking plentifully of water. The branches of heath afford ſhelter, and the ſeeds a principal part of the food of many birds, eſpecially thoſe of the grous kind: and for this purpoſe, the feed-veſſel is formed and protected in ſuch a manner, that the ſeeds are preſerved a whole year, or even longer. Bees collect largely from the flowers, and honey made from them was anciently ſuppoſed to be of a bad quality, but in fact it is only of a darker colour. The foliage affords nouriſhment to the Phalæna quercus, or great egger moth. Dodder frequently entwines itſelf about this plant, and gives it a ſingular appearance. Almoſt every part of Europe abounds with heath, eſpecially the northern countries; it is alſo common in all the temperate parts of the vaſt Ruſſian empire. Heath is called *ling* in ſome parts of England; in Shropſhire, *grig*; in Scotland, *kather*. It is remarkable that Shakeſpeare enumerates heath and ling as different plants. The former of theſe names is from the German *heide*, and the latter from the Daniſh *lyng:* in Swediſh it is *liung*; in Italian, *erica*; in Spaniſh, *brezo*; in Portugueſe, *urze*, *erice*, *torga*, or *eſtorga*; in Ruſſian, *wereſk*.

It varies with white flowers, and with hoary leaves. The latter has been conſidered by ſome as a diſtinct ſpecies, and by others confounded with E. ciliaris. It is frequent on Bagſhot-heath, Enville-common in Staffordſhire, Birmingham-heath, and, as Ray ſays, not only about Windſor, where Cluſius obſerved it, but all over England.

2. Erica lutea, or yellow heath: corollas ovate, acuminate; flowers heaped; leaves linear. The whole plant being covered with its ſhining golden or ſilvery flowers, is very beautiful. Native of the Cape of Good Hope, where it was obſerved by Bergius; and thence introduced here by Mr. Francis Maſſon, in 1774.

Leaves in threes. 3. Erica halicacaba, or purple-ſtalked heath: corollas ovate, inflated; ſtyle included; flowers ſolitary. This is a lofty ſhrub with purpliſh branches; the branchlets ſubtomentoſe and white. Leaves crowded very much, even, rugged about the edge. Corolla purpliſh, ſmooth, diſtinct from all others in its flowers being the ſize of an acorn. Native of the Cape; flowers in May and June.

4. Erica regerminans, or ſelf-ſowing heath: corollas ovate, ſtyle included, calyxes acute, flowers racemed. Native of the Cape.

5. Erica monſoniana, or bladder-flowered heath: flowers at the ends of obtuſe branchlets; calyxes calycled; corolla oblong, inflated; ſtyle included. This is one of the moſt beautiful of this beautiful genus, with large white flowers. Thunberg found it in the interior part of Africa.

6. Erica mucoſa, or mucous heath: corollas ſubglobular, mucous; ſtyle included. Native of the Cape.

7. Erica urceolaris, or hairy-flowered heath: flowers umbelled; calyxes lanceolate; corollas ovate-conical, villoſe; ſtyle included. 8. Erica marifolia, or marum-leaved heath: leaves ovate, pubeſcent, whitiſh underneath; corollas ovate-conical; ſtyle of a middling length. Natives of the Cape; flower in May and June.

9. Erica Bergiana, or Bergius's heath: calyxes reflex; corollas bell-ſhaped; ſtyle included. Found at the Cape by Bergius. It is covered with beautiful flowers.

10. Erica depreſſa, or flat-ſtemmed heath: ſtem depreſſed, flowers few, corollas bell-ſhaped, ſtyle included. 11. Erica pilulifera, or rounded heath: flowers umbelled, corollas bell-ſhaped, ſtyle included. Natives of the Cape.

12. Erica viridi-purpurea, or green-blue heath: flowers ſcattered, corollas bell-ſhaped, ſtyle included. This varies, with leaves in fours. Native of Portugal.

13. Erica pentaphylla, or five-leaved heath: flowers pubeſcent, corollas bell-ſhaped, ſtyle included. 14. Erica nigrita, or black heath: calyxes imbricate, three-flowered, ſeſſile; corollas bell-ſhaped, ſtyle included. 15. Erica planifolia, or ſmooth-leaved heath: leaves ſpreading very much, corollas bell-ſhaped, ſtyle ſtanding out. Theſe are natives of the Cape.

16. Erica ſcoparia, or ſmall green-flowered or bruſh heath: corollas bell-ſhaped, ſtigma ſtanding out, peltate. This is a ſhrub growing to the height of ſeveral feet. The leaves quickly fall off. With the branches of it they make beſoms, whence the trivial name. It is common in the ſouth of Europe, was introduced here about 1770, and flowers in April and May.

17. Erica arborea, or tree heath: branchlets hoary, corollas bell-ſhaped, ſtyle ſtanding out. This is an upright ſhrub, growing to the height of ſix feet, with upright branches covered with a white nap. Leaves very abundant, upright, ſmooth, almoſt awl-ſhaped, covering the branches, wrinkled when dry. Flowers very numerous, on the middle of the branches, ſo that the later leaves are above them; they are on branching peduncles, forming a panicle. Corolla white, ſhort, broad, four-cleft two-thirds of the way. Native of the ſouth of Europe, and the iſland of Madeira; flowers from February to May. Mr. Miller makes it a native of the Cape of Good Hope and Portugal; but moſt of the little he has ſaid on this genus is wrong. He ſets down E. herbacea and ciliaris as natives of England; and he gives no deſcription of any except of this, and that is imperfect and erroneous.

18. Erica veſpertina, or evening heath: corollas bell-ſhaped, ſtyle ſtanding out. This is an upright ſhrub, with the branches growing by threes; leaves triquetrous, even, preſſed cloſe. Flowers in a panicle, nodding, alternate, white, on white pubeſcent peduncles; corolla double the length of the calyx, broad, ſharp, almoſt like that of E. cubico; antheræ black, two-parted, above the throat. Found at the Cape of Good Hope by Thunberg.

19. Erica cruenta, or bloody-flowered heath: leaves ſmooth, bractes remote, calyxes awl-ſhaped, dilated at the baſe; corollas cylindrical, incurved; ſtyle ſtanding out. Flowers axillary; corolla deep crimſon, an inch long, a little bent in, ſmooth, ſubpellucid, a little ſwelling at the top, with a four-cleft mouth; ſegments broad, ſharpiſh, ſuberect; filaments whitiſh. Found by Mr. Francis Maſſon at the Cape of Good Hope, and introduced in 1774. It flowers at various ſeaſons.

Leaves in fours. 20. Erica ramentacea, or ſlender-branched heath: leaves briſtle-ſhaped, corollas globular, ſtyle included, ſtigma doubled. Native of the Cape of Good Hope; flowers in July.

21. Erica perſoluta, or bluſh-flowered heath: calyxes ciliate, corollas bell-ſhaped, ſtyle included. Native of the Cape; flowers from February to May.

22. Erica ſtrigoſa, or dwarf downy heath: leaves pubeſcent, ciliate; corollas bell-ſhaped, ſmooth; ſtyle ſtanding out. Found at the Cape by Mr. Francis Maſſon; it flowers in March and April.

23. Erica tetralix, or croſs-leaved heath: leaves ciliate, flowers in heads, corollas ovate, ſtyle included. Stems ſhrubby, from nine to twelve inches high, branched,

brown, ſomewhat rugged from the remains of the leaves which have fallen off; branches a little woolly. Leaves commonly in fours, but ſometimes in fives, ovate-linear, ſpreading, near the flowers preſſed cloſe to the ſtem, the edges turned in and ciliated, each hair terminating in a ſmall round gland; the upper ſurface is flat, the lower concave and white. Flowers hanging down one over another all one way, forming a little head. It flowers twice in the year. Native of the northern parts of Europe, on moiſt heaths and mooriſh grounds; flowering in July and Auguſt; Linnæus ſays, twice in the year. This ſpecies is not inferior to many of the foreign heaths in the beauty and delicacy of its flowers. It is diſtinguiſhed from the other Britiſh heaths, not only by the flowers growing in a kind of pendulous cluſter on the tops of the ſtalks, but by the leaves growing in fours, and forming a ſort of croſs; whence the trivial and Engliſh names. Our old writers call it *Low-Dutch heath*, or *beſome-heath*.

24. Erica pubeſcens, or hairy heath: leaves rugged, flowers ſeſſile, lateral, corollas ovate, ſtyle included. Thunberg thus deſcribes it: ſtem aſh-coloured, hiſpid, flexuoſe, erect, two feet high and more. Leaves in threes or fours, frequently four on the branches, and three on the branchlets, ſeldom all in fours, linear, obtuſe, rugged, villoſe, incurved, grooved beneath, ſpreading, a line in length. Flowers at the end of the branchlets, umbelled, two, three, or more, together, abundant, blood-red, hirſute. It has its name from the pubeſcency of the flowers. Native of the Cape.

According to Thunberg, this varies much in the ſtem, branches, leaves, and flowers. The principal varieties are theſe: 1. Hairy, with leaves in threes, and the corollas very finely hairy. 2. Hiſpid, with leaves in threes, and hiſpid. 3. Villoſe, with leaves in fours, rugged, and the branches in whorls. 4. Small-flowered, with the leaves on the branches in fours, on the branchlets in threes, hiſpid, corollas minute.

25. Erica abietina, or fir heath: flowers ſeſſile, corollas fig-ſhaped, ſtyle included. Stem aſh-coloured, rugged, erect, a foot high and more. Native of the Cape; flowers in June and July.

26. Erica mammoſa, or breaſted heath: corollas fig-ſhaped, ſtyle ſtanding out. Thunberg ſays it differs from the preceding, in having the calyx linear, the corollas more inflated, the flowers in umbels, and the leaves in ſixes. Native of the Cape.

27. Erica Caffra, or Caffre heath: leaves pubeſcent, flowers heaped, corollas ovate, ſtyle ſtanding out. This is the ſize of juniper. Native of the Cape.

28. Erica ſeſſiliflora, or ſeſſile-flowered heath: flowers in a ſpike, ſeſſile bent down oblong, corollas club-ſhaped, ſtyle ſtanding out. This is a brown rugged ſhrub, determinately branched, ſomewhat rigid, having the appearance of a ſmall pinus ſylveſtris. Native of the Cape.

Leaves ſcattered. 29. Erica faſcicularis, or bundled heath: leaves ſeveral, linear, truncated; flowers in bundles, corollas fig-ſhaped, ſtyle included. Native of the Cape; obſerved there by Bäck.

II. Antheræ creſted, leaves in threes. 30. Erica triflora, or three-flowered heath: flowers terminating; corollas globular, bell-ſhaped; ſtyle included. Stem, according to Thunberg, brown, ſmooth below, hiſpid at the top, erect, a foot high. Native of the Cape; introduced in 1787 by Mr. Francis Maſſon.

31. Erica baccans, or arbutus-flowered heath: leaves imbricate; corollas globular, bell-ſhaped, covered; ſtyle included. Native of the Cape; introduced by Maſſon; flowers in April and May.

32. Erica gnaphalodes, or ſoft-leaved heath: corollas ovate, covered; ſtyle included, ſtigma four-parted. Thunberg deſcribes his gnaphalodes thus: It is a ſmall ſhrub, ſmooth all over, of a cinereous brown colour, erect, a ſpan high. Branches and branchlets dichotomous and trichotomous, filiform, from erect ſpreading, faſtigiate. Leaves ovate, entire, ſmooth, flat above, convex beneath, with a longitudinal groove, preſſed cloſe, the length of the internodes, forming as it were jointed branchlets, a line and a half in length. Flowers terminating, about three together, purple. Native of the Cape of Good Hope.

33. Erica corifolia, or ſlender-twigged heath: flowers umbelled, calyxes turbinate, corollas ovate, ſtyle included. Native of the Cape; flowers in Auguſt.

34. Erica articularis, or jointed heath: corollas ovate, acuminate; ſtyle included, longer than the calyx. 35. Erica calycina, or calycined heath: calyxes ſpreading very much, wheel-ſhaped; corollas ovate, ſtyle included. Natives of the Cape.

36. Erica cinerea, or fine-leaved heath: corollas ovate; ſtyle a little ſtanding out; ſtigma capitate. Root perennial, woody, ſtems ſhrubby, about a foot high, with oppoſite branches; the bark aſh-coloured. Leaves linear, fleſhy, ſpreading above, ſmooth and ſhining, tranſverſely wrinkled, towards the end beſet with a few ſcattered hair-like points; beneath having a longitudinal furrow, which is white from a woolline ſs apparent to the magnifier; the edge ſomewhat membranaceous, and when viewed with the microſcope appearing ſerrulate: the leaves, when young, have three flat ſides, but when full grown are nearly flat. Flowers in long cluſtered whorled terminating ſpikes, ſonorous when ſtruck; they come out from the ſides of the young ſhoots; thoſe from the end-ſhoots are near each other, but ſcattered and bare; thoſe from the ſmall lateral branches generally in pairs. Seeds oval, the ſurface netted, and four times as big as thoſe of E. tetralix. Dr. Stokes remarks, that the lower part of the trunk is free from hairineſs, that the bark of the laſt year's ſhoot is aſh-coloured, covered with a ſhort light-brown woolline ſs, and that the branches are moſtly in threes. Mr. Curtis obſerves, that the ſtyle is incloſed within the corolla, but is longer than the ſtamens; and that it is diſtinguiſhed from E. tetralix, with which and the common heath it grows promiſcuouſly, by the fineneſs, ſmoothneſs, and deep green colour, of its leaves; the flowers alſo grow more in ſpikes, and are of a deeper purple colour. Native of Europe, but not in the ſouth, nor in the extreme northern parts; alſo of the Levant. It flowers from June to Auguſt. It may be applied to the ſame purpoſes as the common heath; and the flowers are much more ſhowy.

37. Erica paniculata, or panicled heath: flowers minute, corollas bell-ſhaped, ſtyle ſtanding out. This is a ſhrub, with linear upright leaves, almoſt even. Flowers purple, very ſmall, as are alſo the calyxes and peduncles; they are ſo abundant as to cover the whole plant. Native of the Cape of Good Hope; flowers from February to April.

38. Erica auſtralis, or Spaniſh heath: leaves ſpreading, corollas cylindric, ſtyle ſtanding out. This is an upright rigid ſhrub, with an aſh-coloured bark. Leaves in threes or fours, linear, obtuſe, ſomewhat rugged on the edge. Native of Spain and Portugal; obſerved in the former by Alſtroemer. Introduced in 1769, by George W. earl of Coventry. It flowers in April and May.

Leaves in fours. 39. Erica phyſodes, or expanded heath: flowers ſubſolitary, corollas ovate, inflated; ſtyle included. Leaves patulous, broad-linear, keeled. Calyx ovate, ſmooth, coloured, one-third of the length of the corolla, which is the ſize of a pea, and viſcid. The flowers are at the ends of the branches in a ſort of umbel. Native of the Cape of Good Hope.

40. Erica empetrifolia, or crowberry-leaved heath: flowers ſeſſile, lateral; corollas ovate. Stem, according to Thunberg, brown, rugged, a foot high. Leaves in ſixes, oblong, obtuſe, incurved, above three-cornered, flat, beneath grooved, rugged, eſpecially underneath, very finely ciliate, imbricate, a line in length. Native of the Cape; introduced by Maſſon; flowers in April and May.

41.

41. Erica cernua, or drooping heath: flowers ovate, capitate; calyxes ciliate, antheræ included. 42. Erica retorta, or crook-leaved heath: leaves recurved, corollas ovate-oblong, ſtyle of a middling length. Found at the Cape by Thunberg.

43. Erica margaritacea, or pearl-flowered heath: corollas pitcher-bell-ſhaped, ſtyle of a middling length. Native of the Cape, where it was found by Mr. Francis Maſſon; flowers in May and June.

III. Antheræ awnleſs included; leaves oppoſite. 44. Erica tenuifolia, or ſmall-leaved heath: corolla and calyx blood-red. According to Thunberg, the whole ſtem is ſmooth, erect, a ſpan high; flowers blood-red. Native of the Cape.

45. Erica paſſerinæ, or paſſerine heath: corollas bell-ſhaped, ſtyle ſtanding out, (included, *Th.*) This has the herb of Paſſerina ericoides, not to be diſtinguiſhed from it, inſomuch that Paſſerina ericoides has entirely the herb of an Erica, with the flowers of Paſſerina. Here we have an inſtance of the intermixture of genera, which is not uncommon in the Cape plants. Native of the Cape.

46. Erica albens, or white heath: racemes pointing one way, corollas ovate-oblong, acute. 47. Erica ſpumoſa, or ſix-angled heath: corollas in threes, covered by a common calyx, ſtyle ſtanding out. Natives of the Cape.

48. Erica capitata, or woolly heath: flowers ſeſſile, corollas covered with a woolly calyx, antheræ middling. Thunberg thus deſcribes it: ſtem ſeldom erect, commonly decumbent, ſmooth, flexuoſe, filiform. Flowers at the ends of the extreme branchlets, peduncled, one, two, or three, together, the whole calyxes covered cloſe with a white wool. Linnæus, in his Species Plantarum, ſays that this is known by its globular flowers, covered with a greeniſh-yellow lanugo. Native of the Cape; flowers from April to July.

49. Erica melanthera, or black-anthered heath: corollas bell-ſhaped, longer than the coloured calyx, antheræ middling, ſtyle ſtanding out. 50. Erica Thunbergii, or Thunberg's heath: corollas flat, with a globular tube, antheræ middling, ſtyle ſtanding out. Found at the Cape.

51. Erica abſynthoides, or wormwood heath: corollas ovate-bell-ſhaped, ſtyle ſtanding out, ſtigma funnel-ſhaped. This ſhrub has the ſtature of wormwood, and is a native of the Cape. Thunberg ſays it varies, 1. With a wand-like ſtem, and branches and leaves very hirſute and rugged. 2. With a wand-like hirſute ſtem and branches, and wrinkled villoſe patulous leaves. 3. With a panicled ſtem, very ſhort branchlets, and the leaves a little rugged and hirſute. 4. With a panicled ſtem, longer faſtigiate branchlets, and the leaves a little rugged and ſmooth.

52. Erica ciliaris, or ciliated heath: racemes pointing one way, corollas ovate, fig-ſhaped, ſtyle ſtanding out. This is a ſuffruticoſe plant, two feet high. Native of Spain and Portugal; introduced about 1773. It flowers from July to September. Caſpar Bauhin gives it the epithet of *Engliſh*; no one, however, has heard of its being found in our iſland, though Mr. Miller has fallen into Bauhin's error, and ſets it down as one of our wild plants.

53. Erica hiſpidula, or hiſpid heath: ſtem hiſpid; leaves about three, ovate, acute, ciliate; corollas roundiſh. Stems decumbent, half a foot high, ſtrigoſe or hairy. Thunberg ſays it much reſembles the *planifolia*, No. 15. but differs in having an erect ſhrubby ſtem, awnleſs antheræ, the leaves ſcarcely ciliate, revolute, more approximating, the corollas globular and ſmooth. Native of the Cape of Good Hope.

54. Erica petiolata, or roſemary-leaved heath: leaves oblong, petioled; corollas in threes, ovate, the length of the calyx; antheræ ſtanding out a little, ſtyle ſtanding out. Native of the Cape; flowers from March to June.

55. Erica leucanthera, or white-anthered heath: flowers in threes, calyx white, corolla bell-ſhaped, antheræ and ſtyle ſtanding out. Stem erect, ſmooth, a foot high and more. Branches commonly in threes, pubeſcent, erect, wand-like; branchlets ſcattered, very frequent, filiform and capillary, pubeſcent, erect, leafy. Leaves three-cornered, obtuſe, preſſed cloſe, ſmooth, with a very ſlender groove underneath. Flowers on very ſhort peduncles, erect. This is diſtinguiſhed by its white corolla, and awnleſs, projected, white, anthers. Found at the Cape by Thunberg.

Leaves in fours or more. 56. Erica tubiflora, or tube-flowered heath: leaves ſubciliate, corollas club-fig-ſhaped, antheræ and ſtyle included. 57. Erica curviflora, or curve-flowered heath: leaves ſmooth, corollas club-fig-ſhaped, antheræ and ſtyle included. 58. Erica coccinea, or ſcarlet heath: calyxes hirſute, corollas club-fig-ſhaped, antheræ ſubincluded, ſtyle included. Natives of the Cape.

59. Erica conſpicua, or long-tubed yellow heath: leaves ſmooth, corollas cylindric, curved, very long, hairy, with a revolute border, antheræ ſubincluded, ſtyle ſtanding out. Found at the Cape of Good Hope by Mr. Francis Maſſon; flowers from May to Auguſt.

60. Erica cerinthoides, or honeywort-flowered heath: corollas club-fig-ſhaped, ſtigma included, cruciate. Native of the Cape; introduced by Mr. Francis Maſſon; flowers moſt part of the year.

61. Erica faſtigiata, or pointed heath: corollas ſalver-ſhaped, in bundles, ſtyle included. 62. Erica cubica, or ſquare heath: calyxes four-cornered, corollas bell-ſhaped, acute, ſtyle included. Natives of the Cape.

63. Erica denticulata, or toothed heath: calyxes toothletted, corollas ovate, funnel-ſhaped, ſtyle included. Stems diſtorted, as in common heath; leaves crowded together, ſpreading a little, ſubcylindric, even; flowers in terminating bundles. Obſerved at the Cape by Bergius.

64. Erica viſcaria, or clammy-flowered heath: flowers in racemes, corollas bell-ſhaped, glutinous, ſtyle included. Native of the Cape; flowers in March.

65. Erica granulata, or granulated heath: calyxes ſubimbricate, corollas globular, ſtyle included. This reſembles E. ramentacea, and Thunberg makes it to be the ſame. It is a native of the Cape.

66. Erica comoſa, or tufted-flowered heath: flowers heaped, corollas ovate-oblong, ſtyle included. Native of the Cape.

67. Erica Sparrmanni, or Sparrmann's heath: leaves imbricate, ciliate, heads four-flowered, corollas tubular, ſtrigoſe-hiſpid, antheræ ſubincluded. This is remarkable for having the flowering heads always divided into four flowers; before theſe are elongated, the head appears globular, and echinate, as in achyranthes, from the very ſpreading yellow briſtles of the leaves of the involucre and calyx. Obſerved by Sparrmann far inland from the Cape of Good Hope.

68. Erica concinna, or fleſh-coloured heath: leaves in ſixes or thereabouts, ſmooth; flowers terminating, umbelled; corollas cylindric, attenuated at the baſe. Branches ſmooth; leaves on the branches in ſixes, on the branchlets in fours, petioled, erect, aceroſe, four lines in length; flowers from three to ſix in an umbel. Obſerved by Maſſon at the Cape of Good Hope; flowers in September and October.

69. Erica Maſſoni, or tall downy heath: leaves in eight rows, imbricate, pubeſcent; flowers capitate, corollas cylindric, fig-ſhaped. Obſerved by Bäck at the Cape; introduced in 1787 by Mr. Francis Maſſon.

IV. Antheræ awnleſs, ſtanding out; leaves in threes. 70. Erica Plukenetii, or ſmooth-twigged pencil-flowered heath: calyxes ſimple, corollas cylindric, antheræ very long, ſtyle ſtanding out. Reſembles the following ſpecies, but the calyx is ſimple. Native of the Cape.

71. Erica Petiveri, or downy-twigged pencil-flowered heath: calyxes imbricate, corollas acute, antheræ very long, ſtyle ſtanding out. This is a brown ſhrub. Branches covered with branchlets in threes, crowded, very ſhort, pubeſcent, clothed with ſquarroſe leaves. Native of the Cape; flowers from January to March.

72. Erica nudiflora, or naked-flowered heath: branches tomentoſe,

tomentoſe, corollas cylindric, ſcattered. This is alſo a native of the Cape: it is known only by a ſingle ſpecimen in the Linnæan Herbarium.

73. Erica Bruniades: flowers ſcattered, corollas covered by a woolly calyx, ſtyle ſtanding out. Native of the Cape. Thunberg makes this to be the ſame with the *capitata*.

74. Erica imbricata, or imbricate heath: corollas bell-ſhaped, covered with the imbricate calyx, ſtyle ſtanding out. Native of the Cape.

75. Erica umbellata, or umbelled heath: leaves aceroſe, corollas bell-ſhaped, ſtyle ſtanding out. This little ſhrub has the habit of common heath. Native of Portugal.

Leaves in fours or more. 76. Erica purpuraſcens, or purple heath: flowers ſcattered, corollas bell-ſhaped, ſtyle ſtanding out. Native of the ſouth of Europe.

77. Erica vagans, or wandering heath: flowers ſolitary, corollas bell-ſhaped, ſtyle ſtanding out. Stem like that of empetrum, ſhrubby, ſomewhat rugged; the extreme branches whitiſh and divaricating. Leaves in fours, ſeldom in fives, linear, bluntiſh, ſometimes ſmoothiſh, ſometimes a little rugged, beneath convex and channelled, ſhortiſh, crowded. Native of Africa, and alſo of the neighbourhood of Thouloufe. See No. 80, which is ſuppoſed to be the ſame.

78. Erica herbacea, or early-flowering dwarf heath: flowers directed all one way, corollas oblong, ſtyle ſtanding out. This is a ſmall ſhrub, from a foot to eighteen inches in height, decumbent at the bottom, then upright, branched, flexible. Flowers at the tops of the branchlets, on ſhort peduncles, alternate, among the leaves; they come out in autumn, continue cloſed during winter, and are then green; in May the year following the flowers are unfolded, the antheræ which were incloſed are protruded, the calyx and corolla opening are both changed into a pale purple or fleſh-colour. Hence many authors, among whom is Linnæus, have made two ſpecies of this. Native of Auſtria, Swiſſerland, and Sileſia. Introduced in 1763, by the earl of Coventry.

79. Erica multiflora, or many-flowered heath: leaves in fives, flowers ſcattered, corollas cylindric, ſtyle ſtanding out. Stem the height of a man. Leaves in fours or fives, ſpreading, obtuſe, gibbous at the baſe. Flowers purpliſh. Native of the ſouth of Europe. It flowers from June to November. Linnæus ſets this down as a native of England: but our plant, which he ſuppoſed to be the ſame with his *multiflora*, is the next ſpecies.

80. Erica didyma, or double-anthered heath: leaves in fives, peduncles ſcattered, longer than the flower, corollas bell-ſhaped, antheræ twin, ſtyle ſtanding out. Stems twiſted, trailing. Branches between ſcored and angular, light reddiſh brown, the more ſlender ſhoots aſh-coloured, all lateral, to ſeven or more riſing from the ſame point in the manner of an umbel, in ſome ſtates of its growth giving it much the appearance of euphorbia cyparifſias; when beginning to flower, gradually tapering towards the end. Leaves linear, ſomewhat like thoſe of fir, bowed ſideways, ſmooth, but not gloſſy, ſomewhat pointed, when magnified appearing to have diſtant ſerratures on the edge, which is bent in, upper ſurface green, ſlightly elevated in the middle, under whitiſh, convex, with a ſmooth furrow running along it, longer, and ſometimes thrice as long as the corolla, and crowded ſo cloſe as to conceal the younger ſhoots. Seeds reddiſh brown. Found on heaths, as on Goonhilly-downs, going from Helſton to the Lizard-point, in Cornwall. It flowers from June to Auguſt. The ſame with E. vagans, No. 77.

81. Erica Mediterranea, or Mediterranean heath: leaves ſpreading, flowers ſcattered, corollas ovate, ſtyle ſtanding out. Reſembles E. multiflora, but the corolla is abſolutely ovate; the branches angular and white. Native of the ſouth of Europe; introduced about 1765 by Mr. Joſhua Brooks; it flowers from March to May.

82. Erica grandiflora, or great-flowered heath: leaves in ſixes or thereabouts, aceroſe, ſmooth; flowers axillary, peduncled; corollas cylindric, ſubincurved, ſmooth; ſtyle elongated. This reſembles E. curviflora, but the leaves are longer. Obſerved at the Cape of Good Hope by Thunberg; introduced here in 1775 by Maſſon; it flowers from May to July.

Place uncertain. 83. Erica tetragona, or four-ſided heath: leaves in threes, flowers in racemes, pointing all the ſame way; calyx linear, corolla four-cornered, oblong, ſtyle included. Flowers yellow, like thoſe of E. lutea, but longer. Native of the Cape.

84. Erica pyramidalis, or pyramidal heath: antheræ awnleſs, included; corollas funnel-ſhaped, in fours; ſtyle a little protruded; leaves in fours, pubeſcent. Introduced from the Cape by Maſſon in 1787.

Propagation and Culture. Common heath, which overruns immenſe tracts, eſpecially in the elevated parts of northern countries, can be extirpated only effectually by paring and burning. In ſome lands, deep and croſs ploughings, getting up roots with heavy harrows, burning the whole, and ſpreading the aſhes, may be ſufficient. Dr. Anderſon affirms, that wherever heath abounds, there is generated, by the rotting of the plant, a peculiar black earth, that is not only of itſelf ſterile, but has a powerful tendency to make any other ſoil unfertile; ſo that in improving heathy grounds, the top ſoil ſhould be buried by trenching or deep ploughing.

Notwithſtanding the commonneſs of our Britiſh heaths, they deſerve a place in ſmall quarters of humble flowering ſhrubs, where, by the beauty and long continuance of their flowers, together with the diverſity of their leaves, they make an agreeable variety. They may be taken up, with a ball of earth to their roots, from the natural places of their growth, in autumn. The ſoil ſhould not be dunged, and the leſs the ground is dug, the better they will thrive, for they commonly ſhoot their roots near the ſurface. They may alſo be propagated by ſeeds, but this is a tedious method.

12, 16, 17, 38, 52, 75–79, 81. Theſe, which are natives of the ſouthern countries of Europe, will bear the open air in England in a dry ſoil and a warm ſituation. They may be increaſed and treated in the ſame manner with our Britiſh heaths, and may alſo be propagated by layers and cuttings.

All the reſt of this numerous and beautiful genus being natives of the Cape of Good Hope, or the more interior parts of Africa leading to that famous promontory, muſt be preſerved in the dry ſtove, greenhouſe, or glaſs caſe. Theſe may be increaſed either from cuttings or from layers. There are not many of the ſpecies but what may be increaſed in the firſt way, provided good young ſhoots can be got for cuttings; eſpecially if they are put under bell-glaſſes, and the pots are ſet where they can be ſhaded, and have a moderate heat. Theſe plants ſhould have a light and rather poor ſoil to grow in; a compoſition of bog earth and light loam will ſuit them well. Mr. James Donn, curator of the botanic garden at Cambridge, collected upwards of ſixty of theſe Cape heaths, which he cultivated in 1795; though he was appointed to his office only at Michaelmas 1794. See ALYSSUM, ANDROMEDA, BLŒRIA, BRUNIA, BRYONIA, DIOSMA, EMPETRUM, HOTTONIA, PASSERINA, PENÆA, PHYLLICA, FUCUS, and FRANKENIA.

ERICÆFOR'MIS, *ſ.* in botany. See DIOSMA and HUDSONIA.

ERICEY'RA, a town of Portugal, in the province of Eſtremadura, on the ſea coaſt: twenty miles north-weſt of Liſbon.

ERICOI'DES, *ſ.* in botany. See ELATINE.

ERICOI'LA, *ſ.* in botany. See GENTIANA.

ERICHTHO'NIUS, the fourth king of Athens, fabled to have ſprung from the ſeed of Vulcan which fell upon the ground when that god attempted to offer violence to Minerva. He was very deformed, and had the tails of ſerpents inſtead of legs. Minerva placed him in a baſket, which ſhe gave to the daughters of Cecrops, with ſtrict injunctions not to examine its contents. Aglaurus, one

of

of the ſiſters, had the curioſity to open the baſket, for which the goddeſs puniſhed her indiſcretion by making her jealous of her ſiſter Herſe. Erichthon was young when he aſcended the throne of Athens. He reigned fifty years, and died B. C. 1437. The invention of chariots is attributed to him, and the manner of harneſſing horſes to draw them. He was made a conſtellation after death under the name of Bootes. *Virgil.*

E'RICU, *ſ.* in botany. See ASCLEPIAS.

ERICU'SA, one of the Lipari iſles, now *Allcudi.*

ERI'DANUS, one of the largeſt rivers of Italy, riſing in the Alps and falling into the Adriatic by ſeveral mouths; now called the *Po.* It was in its neighbourhood that the Heliades, the ſiſters of Phaeton, were changed into poplars, according to Ovid. Virgil calls it the king of all rivers, and Lucan compares it to the Rhine and Danube.

ERI'DANUS, the *River*, a conſtellation of the ſouthern hemiſphere, and one of the forty-eight old aſteriſms. The ſtars in this conſtellation, in Ptolemy's catalogue, are thirty-four, in Tyche's nineteen, and in the Britiſh catalogue eighty-four.

ERI'E, an Indian nation, formerly poſſeſſing the banks of lake Erie, called by the French *du Chat*, or Cat-nation. They were extirpated by the Iroquois about the year 1655.

ERI'E, a lake of the fourth magnitude in North America, and through which runs the line between the United States and Upper Canada. D'Etroit river on the weſt brings the waters of the great lakes with which lake Erie has a communication on the north-weſt, and Niagara river on the eaſt, forms its communication with the waters of lake Ontario and the river St. Lawrence. It is ſituated between 41. and 43. N. lat. and between 78. 48. and 83. W. lon. Its form is elliptical. Its length is about 225 miles; and its medium breadth about 40. It affords good navigation for ſhipping of any burden. The coaſt on both ſides of the lake is generally favourable for the paſſage of batteaux and canoes. Its banks in many places have a flat ſandy ſhore, particularly to the eaſtward of the peninſula called Long Point, which runs upwards of eighteen miles into the lake, and being compoſed of ſand is very convenient to haul boats out of the ſurf upon it, when the lake is too rough for ſailing and rowing; yet in ſome places, chiefly on the ſouth ſide towards both ends of the lake, it would be dangerous to approach and impoſſible to land, by reaſon of the perpendicular height of the rocks. Some of theſe, (as at Crayahoga,) are magnificent beyond deſcription, and muſt alſo inſpire dread in the boldeſt heart, when viewed from the water. Lake Erie has a great variety of fine fiſh, ſuch as ſturgeon, eel, trout, perch, &c. Lakes Huron and Michigan afford communication with lake Erie, by veſſels of eight feet draught. There are portages into the waters of lake Erie from the Wabaſh, Great Miami, Muſkingum, and Alleghany, from two to ſixteen miles. The portage between the Ohio and Potowmack about twenty miles. Some of theſe rivers are connected in a moſt ſingular manner with others, which run in a courſe totally different. For inſtance, after paſſing over the lakes Erie, St. Clair, and Michiligan, to the head of Puan's Bay, we reach Fox River; from hence there is a portage of three miles only to Ouiſconſing River, which empties itſelf into the Miſſiſſippi; and, in the fall of the year, when the waters are high, and the rivers overflow, it is oftentimes poſſible to paſs from Fox River to Ouiſconſing River, without ever getting out of a canoe. Thus, excepting a portage of three miles only at the moſt, it is poſſible to go the whole way by water from Preſque Iſle, on Lake Erie, to New Orleans, at the mouth of the Miſſiſſippi, a diſtance of near four thouſand miles.

ERI'E FORT, a ſtrong fortification in Upper Canada, ſituated on the north ſhore of lake Erie, and on the weſt bank of Niagara river, twenty-ſeven miles ſouth by eaſt of Niagara Fort, and eighteen above the carrying place at the Falls of Niagara. Lat. 42. 59. N. lon. 78. 20. 30. W. The fort and ſurrounding houſes built on the rocky ſhore, the veſſels lying at anchor, the verdant meads, the diſtant hills on the oppoſite ſide of the lake, and the vaſt lake itſelf, extending to the fartheſt boundary of the horizon, forms an intereſting, contemplative, and captivating ſcene.

ERIEU'X, a river of France, which runs into the Rhone, at Beauchaſtel.

ERI'GENA (John Scotus), an eminent philoſopher in the ninth century, ſuppoſed to have been a native of Scotland, though ſome writers aſſert that he was a native of Herefordſhire, and others of Ireland. He was poſſeſſed of an ardent thirſt for literature; and, finding few advantages in his native country, is ſaid to have travelled into foreign parts, and to have ſtudied at Athens, and other places, where he acquired a knowledge of the Greek, Chaldaic, and Arabic, languages, and became more intimately converſant in the Grecian philoſophy than any of his contemporaries in that dark age. From the extent of his erudition he obtained the name of Scotus the Wiſe. He was alſo diſtinguiſhed by the livelineſs of his wit, and his pleaſing manners, as well as his extraordinary acquirements. His fame having reached the court of Charles the Bald, king of France, the greateſt patron of literature in that period, he received an invitation from that prince to viſit him; which he accepted, and lived for ſeveral years in habits of the utmoſt intimacy and familiarity with his royal patron, who gave him the direction of the univerſity of Paris. While Erigena reſided at the court of France, he compoſed a variety of works, ſome in refutation of tranſubſtantiation, which procured him a number of admirers, and alſo many enemies. Erigena tranſlated the treatiſes of Dionyſius the Areopagite, "On the celeſtial Monarchy;" "On the Eccleſiaſtical Hierarchy;" "On Divine Names;" and "On Myſtic Theology." This tranſlation was received with great eagerneſs by the weſtern churches; but as it contained many things contrary to the faith of the church of Rome, pope Nicholas I. was highly diſpleaſed, and wrote a threatening letter to the French king, commanding that Erigena ſhould be baniſhed from the univerſity of Paris, and ſent to Rome. Charles, however, had too great a regard for Erigena, and, accordingly adviſed him to withdraw to England. The principal work of Erigena was his treatiſe "On the Diviſion of Nature, or the Natures of Things," which, after long lying in MS. in undiſturbed repoſe, was publiſhed at Oxford, in 1681, by Dr. Thomas Gale, under the title of *Joannis Scoti Erigena de Diviſione Naturæ Libri quinque, diu deſiderati.* This work is an object of literary curioſity, as furniſhing us with an extraordinary example of metaphyſical ſubtlety and acuteneſs, for the age in which the author lived, which he acquired by ſtudying the writings of the Greek philoſophers. By the application of it to theological ſubjects, he became the father of that ſcholaſtic divinity, which made ſo diſtinguiſhed a figure in the middle ages, and ſo long obſtructed the progreſs of genuine ſcience. According to Cave and Tanner, Erigena took refuge in England in the year 877, and was employed by king Alfred in the reſtoration of learning at the univerſity of Oxford. Tanner aſſerts, that he was appointed profeſſor of mathematics and aſtronomy in that univerſity in the year 789. After continuing to teach there for three years, ſome differences took place in the univerſity, which occaſioned him to quit his ſituation, and retire to the abbey of Malmſbury in Wiltſhire, where he opened a ſchool. In this place, according to the accounts of the generality of Engliſh writers, he was murdered by his ſcholars, in the year 883. But Dr. Henry, in the ſecond volume of his Hiſtory of Britain, gives it as the moſt probable opinion that he died in France.

ERI'GERON, *ſ.* [of Pliny, Theophraſtus, and Dioſcorides; from ηρ, ſpring, and γερων, Gr. old man; becauſe it is hoary in the ſpring.] In botany, a genus of the claſs ſyngeneſia, order polygamia ſuperflua, natural order of compoſitæ diſcoidæ, (corymbiferæ, *Juſſ.*) The generic characters are—Calyx: common, oblong, cylindric, imbricate; ſcales ſubulate, upright, gradually longer, nearly equal. Corolla: compound, rayed; corollets hermaphrodite,

maphrodite, tubular in the disk; females ligulate in the ray; proper of the hermaphrodite funnel-form; border five-cleft; of the female, ligulate, linear, subulate, upright, commonly quite entire. Stamina: in the hermaphrodites; filaments five, capillary, very short; antheræ cylindric, tubular. Pistillum: in the hermaphrodites; germ very small, crowned with a down longer than its corollet; style filiform, length of the down; stigmas two, very slender. Perianthium: none; calyx converging. Seeds: in the hermaphrodites oblong, small; down long, hairy; of the females extremely like the hermaphrodites. Receptaculum: naked, flat. Dillenius observes that the inmost or intermediate florets of the disk are commonly males; one species has female naked florets.—*Essential Character.* Receptaculum naked; down hairy; corolla of the ray linear, and very narrow.

Species. 1. Erigeron viscosum, or clammy erigeron: peduncles one-flowered, lateral; leaves lanceolate, toothletted in the middle, reflex at the base; calyxes squarrose, corollas radiate. Stem upright, stiff, striated, hairy, viscid, branched from the very bottom, near three feet high; leaves alternate, four inches long, and two broad in the middle; flowers single, on pretty long foot-stalks, some from the side, others from the end of the stalk; they are yellow, have an agreeable odour, and appear in July. Native of the south of France, Italy, Sicily, Portugal, and Spain, by way-sides, and on the borders of vineyards. Cultivated by Mr. Miller before 1759. It is used to drive away fleas and gnats; the strong scent, as some suppose, being disagreeable to those insects; but it is probable they are caught by the clammy juice of the leaves and stalks. The old name of this is *great sweet fleabane*, or *great fleawort*. Root perennial.

2. Erigeron graveolens, or strong-smelling erigeron: leaves sublinear, quite entire; branches lateral, many-flowered. Root annual; stems eight or ten to eighteen inches in height, striated, branched the whole length. Monf. Villars thinks that this species rather belongs to the genus solidago. The stalks are in gardens stiff, and three feet high. The flowers are produced in close bunches from the side of the stalk towards the top; they appear in July, and in warm seasons the seeds ripen in England. Native of the south of France, and Italy; very frequent near Madrid; called formerly *small true fleabane*.

3. Erigeron glutinosum, or glutinous erigeron: leaves lanceolate-linear, hairy-viscid; peduncles one-flowered. Root perennial; stems a long span in height. Native of the south of France and Spain, on mountains near the coast; flowering in August.

4. Erigeron ficulum, or red-stalked erigeron: lower calycine scales loose, longer than the flower; peduncles leafy. Annual; stems red. It greatly resembles the second species, except that it has no ray whatever; and it is allied to inula pulicaria. Found in Sicily, and about Montpelier, in marshes; flowers in August and September.

5. Erigeron Carolinianum, or Carolina erigeron: stem panicled; flowers subsolitary, terminating; leaves linear, quite entire. Stems three feet high and more, straight, round, streaked, the thickness of the little finger at bottom, where they are red, growing gradually more slender upwards; the leaves from top to bottom are frequent, very narrow, and somewhat hairy. Towards the top the stem puts forth branches, forming in the whole a sort of pyramid; these are covered with leaves like those of the stem, only shorter and narrower; each of these bears one small flower, sometimes more. The root-leaves are like those on the stem, only shorter and blunter. It flowered in the green-house of the Eltham garden, in November 1727; but being a native of North America, it is hardy enough to flower in the open ground in July and August. It is perennial. In the text of Hortus Elthamensis this is marked fig. 393. but on the plate fig. 394.

6. Erigeron Canadense, or Canadian erigeron: flowers in panicles, hairy, rough; leaves lanceolate, ciliate. Root annual; stem firm, hairy, sometimes three or four feet high, frequently crooked, much branched towards the top, and even from the middle, the branches gradually shorter, and forming a long cone; lower leaves oval, tapering to a foot-stalk, with large blunt distant teeth; higher up lanceolate, distantly serrate, (or entire,) slightly hairy on the upper, but more so on the lower surface, those on the branches and at their base linear-lanceolate, entirely sessile; flowering heads numerous, on simple or branched slender peduncles. This came originally from North America; but now has the appearance of being indigenous in many parts of Europe: with us, it is not uncommon about London, on cultivated grounds, and on rubbish. It flowers in August. Petiver calls it *white golden rod*. Being a naturalized plant, it would be curious to ascertain when it first appeared among us in a wild state. In Ray's Synopsis it is said to have been observed by Dr. Tancred Robinson. Merret (in 1667) says it is plentiful at Heddington-hill, by Oxford, and in Yorkshire. Petiver mentions its growing about London.

7. Erigeron bonariense, or buck's-horn erigeron: leaves rolled back at the base. Native of Buenos Aires, in South America; cultivated in the Eltham garden in 1732; flowers in July and August.

8. Erigeron Jamaicense, or Jamaica erigeron: stem few-flowered, subvillose; leaves wedge-form-lanceolate, with two serratures on each side. Sloane observes that the roots are smooth, white, no bigger than threads, and an inch and an half long; stem round, hoary, five or six inches high, having few leaves, placed without order, sessile, with a narrow beginning, augmenting to a round end, about an inch long, rough, hoary, of a whitish green colour, very often having two or three notches; flowers on the top of the stem, and from the axils, resembling those of groundsel, composed of many small yellow florets close set together, encircled by many whitish, long, narrow, semiflorets. Native of Jamaica.

9. Erigeron Philadelphicum, or spreading erigeron: stem many-flowered; leaves lanceolate, subserrate, those on the stem half-stem-clasping; floscules of the ray capillaceous, the length of the disk. Native of North America; observed in Canada by Kalm. Perennial; it flowers from June to August. Loureiro thus describes a Cochinchinese plant under this name: Stem herbaceous, three feet high, erect, branched; leaves sinuate; flowers yellow, panicled, terminating, oblong, many; female florets in the ray very slender, erect; receptacle naked; down hairy. It agrees in the specific character with this species, but it is doubtful whether they are the same species. The description in Linnæus's species belongs to E. Ægyptiacum.

10. Erigeron purpureum, or purple erigeron: stem many-flowered, hairy; leaves oblong, somewhat toothed, stem-clasping; corollas of the ray capillaceous, longer than the disk. Root perennial; stem herbaceous, branched, a foot or more in height. Native of Hudson's Bay; flowering in July and August.

11. Erigeron Ægyptiacum, or Egyptian erigeron: leaves half-stem-clasping, spatulate, toothed; flowers globular. Root annual; stem simple, upright, a foot and an half high, somewhat streaked, ash-coloured, pubescent, and somewhat viscid. Native of Sicily and Egypt.

12. Erigeron Gouani, or cluster-flowered erigeron: flowers heaped; calyxes scarious; leaves lanceolate, somewhat toothed, scabrous about the edge. Root annual, bitter; stem upright, round, a foot high, simple, with a few upright hairs. It approaches very near to E. Ægygtiacum. According to Gouan, the stem is smooth, very slightly streaked, rough at the top, with whitish hairs pressed close; the root-leaves and lower stem-leaves are petioled, ovate, ciliate, an inch wide, near two inches in length, or as long as the petiole, very smooth, quite entire at the base, toothed from the middle to the tip; teeth large, equal, distant: middle stem-leaves sessile or rather stem-clasping, lanceolate; upper stem leaves, and those on the branches, narrower, hirsute, quite entire;

flowers

flowers the size of thoſe on E. tuberoſum, and globular; calyx having the colour and appearance of conyza chinenſis, but with the ſcales not at all ſquarroſe, fleſhy, green, membranaceous at the edge, and very ſmooth; corollas whitiſh, with white down. Native of the Canary iſlands; flowers in July and Auguſt.

13. Erigeron acre, or blue erigeron: peduncles alternate, one-flowered; ſtems ſix to eighteen inches high, upright, ſomewhat angular, hairy, often purple; in ſome ſcarcely branched at all, in other plants very much ſo. Inhabits dry lofty paſtures frequent, eſpecially ſandy and calcareous ſoils; alſo often found on walls; near London it is not a common plant; but it occurs frequently near Charlton-wood. Johnſon, in Gerarde, ſays, that he firſt obſerved it in company of Mr. George Bowles, Mr. John Bugs, and others, by Farmingham, in Kent; and the laſt year, (1635,) Mr. William Broad found it growing at the blockhouſe at Graveſend. It flowers from July to September. The Germans take a decoction of it to attenuate viſcid phlegm. Cows and goats refuſe it. Our Engliſh botaniſts name it blue-flowered or purple fleabane. Several ſpecies of this genus have this name of fleabane in Engliſh; which tends (as Mr. Curtis very well obſerves) to confound this with the genus conyza. Gærtner remarks, that it has ſome affinity with chryſocoma, and that erigeron is a chryſocoma with a difform ray.

14. Erigeron alpinum, or alpine erigeron: ſtem with one or two flowers; calyx ſubhirſute; leaves obtuſe; villoſe underneath. This is like the foregoing, inſomuch that Haller doubts whether it be a diſtinct ſpecies, or only a variety. It has frequently a higher ſtem, but the height varies much in both; commonly one-flowered, ſeldom two-flowered. The flowers are larger; the ſemi-florets more numerous; the leaves longer; the feather denſe and whitiſh: it varies with one, two, and three, flowers on a ſtalk, and ſometimes they are panicled; it varies alſo with a villoſe and ſmooth calyx. The flowers in this come out from the middle and even the lower part of the ſtem; whereas in moſt of the ſpecies they branch out only from the upper part. Native of Alpine paſtures. Found on Ben Lawers, in Scotland, by Mr. Dickſon, in 1789. Perennial; flowers in July and Auguſt.

15. Erigeron uniflorum, or dwarf erigeron: ſtem one-flowered; calyx hairy; root perennial; ſtems a finger's length; ſcarcely three inches high according to Haller; from a finger's length to a ſpan and more, as others ſay; very ſimple, ſtreaked, with wandering hairs ſcattered over them. The flower is as large as in the foregoing ſpecies, thick, the ſcales covered with a white nap, lanceolate, broader; all the ſemiflorets ligulate, with no imperfect ones; ſometimes purple, according to Pontedera and Scheuchzer. All the varieties with one and many flowers, with a ſmooth and hairy calyx, with blue and white flowers, make but one ſpecies, in the opinion of Allioni. Hence Scopoli has named this E. polymorphum. Monſ. Villars on the contrary, thinks that this bears little affinity to E. alpinum, or any other; from which it is eaſily diſtinguiſhed by the open ſcales of the calyx, loaded with long and wider hairs, be the plants ever ſo ſmall. He refers Oeder's figure to this ſpecies; but obſerves that he has never ſeen any ſpecimen ſo large as that repreſents. Native of the European mountains from Lapland to Italy: flowers in Auguſt and September.

16. Erigeron gramineum, or graſs-leaved erigeron: ſtem one-flowered; leaves linear; ciliate; ſcabrous. A very ſmall perennial plant, guarded with fading dry leaves. Native of Siberia.

17. Erigeron camphoratum, or Virginian erigeron: leaves lanceolate-ovate, villoſe; ſerratures cartilaginous at the tip; annual. Native of Virginia.

18. Erigeron Japonicum, or Japan erigeron: leaves ſeſſile, obovate, ſerrate, villoſe, flowers panicled; annual; ſtem ſimple, filiform, hairy, upright, a foot high. Native of Japan; flowers in June.

19. Erigeron ſcandens, or climbing erigeron: leaves ovate, ſerrate, villoſe; flowers axillary; ſtem climbing. Having ſeen only a ſingle flower, and that not open, Thunberg ſays he is not very certain about the genus.

20. Erigeron tuberoſum, or tuberous-rooted erigeron: leaves linear; branches one-flowered; ſtem ſuffruticoſe. It is the link between this genus and after. Native of the ſouth of France and Syria.

21. Erigeron fœtidum, or ſtinking erigeron: leaves lanceolate-linear, retuſe, flowers corymbed; root perennial, thick, fibrous, from which ariſe ſeveral upright hairy ſtalks, near four feet high, putting out ſeveral ſide branches; leaves ſeſſile, hairy, a quarter of an inch broad towards the end, where they are broadeſt, and diminiſhing gradually to their baſe; of a deep green on their upper ſide, and pale on their under, continuing all the year: they come out from the ſide of the ſtalk, and branches in cluſters from the ſame point, and without order, on every ſide. The ſtem is terminated by ſeveral large corymbs of golden-coloured flowers: theſe appear late in the autumn, continuing in beauty great part of the winter, fading in the ſpring, and are ſometimes ſucceeded by oval ſeeds, which ripen in England. The ſtems generally decay the ſecond year, and are then ſupplied by new ones from the ſame root; the old ones remaining with their green hairy leaves in vigour, until the young ones are grown to a conſiderable height. Native of the Cape of Good Hope; and has been long cultivated in the curious European gardens. It has a great reſemblance to inula fœtida, but the flowers are floſculous. Cultivated in 1722, in the botanic garden at Chelſea.

22. Erigeron obliquum, or oblique-leaved erigeron: very much branched; leaves ovate; oblique; annual; ſtem herbaceous, a hand high, round, erect, hairy, branching very much. Native of the Eaſt Indies.

23. Erigeron tricuneatum, or wedge-leaved erigeron: ſomewhat ſhrubby; leaves wedged, three-lobed. A ſmall ſhrub, very much branched or panicled, leafy. Native of Mexico; obſerved there by Mutis.

24. Erigeron pinnatum, or pinnatifid leaved erigeron: leaves pinnatifid, toothed; ſtem herbaceous, upright, a foot high. Native of the Cape of Good Hope.

25. Erigeron Sumatrenſe, or Sumatra erigeron: tomentoſe; flowers raceme-panicled; leaves lanceolate, ſubſerrate; ſtem three feet high and more, round, ſtreaked, tomentoſe, red. Native of Sumatra.

26. Erigeron ſericeum, or ſilky-leaved erigeron: flowers panicled; leaves ovate-lanceolate, tomentoſe-ſilky, entire and ſerrate, appendicled at the baſe. Native of Java. The two laſt were brought to Europe by Wennerberg.

27. Erigeron hirſutum, or hirſute erigeron: ſtem hiſpid; leaves linear-lanceolate, ſubſerrate, very hairy on both ſides; ſtem herbaceous, two feet high, erect, round. Native of China, near Canton.

28. Erigeron rivulare, or rivulated erigeron: leaves wedge-ſhaped, acute, rough with hairs, toothed on both ſides at the tip, ciliate on the edge, thoſe on the ſtem ſeſſile; ſtem almoſt ſimple, erect, few-flowered. This is an annual plant, native of Jamaica and Hiſpaniola.

29. Erigeron decurrens, or retiring erigeron: leaves decurrent, linear, tomentoſe; flowers panicled. Native of Arabia.

30. Erigeron incanum, or hoary erigeron: leaves linear, tomentoſe, toothed a little; flowers corymbed; ſtem ſhrubby. Native of Arabia and Felix.

Propagation and Culture. The firſt ſpecies is propagated by ſeeds, which, if ſown in autumn, will more certainly ſucceed than thoſe which are ſown in the ſpring. When the plants come up, they ſhould be thinned if they are too cloſe, and kept clean from weeds till autumn, when they ſhould be tranſplanted where they are to remain. They delight in a dry ſoil, and a ſunny expoſure. The ſecond year the plants will flower and perfect their ſeeds, but the roots will continue ſeveral years, and annually produce their flowers and ſeeds.

6, 7, 13, 14. Are preſerved in botanic gardens, for the

ſake of variety, but are ſeldom admitted into gardens for pleaſure. The fourteenth ſort is a perennial plant, which grows naturally on the Alps, and may be propagated by ſeeds in the ſame manner as the firſt ſort, but ſhould have a ſhady ſituation, and a moiſt ſoil. The others are annual plants, which, if once admitted into a garden, and ſuffered to ſcatter their ſeeds, will become very troubleſome weeds there. They will help very well to cover rubbiſh or rock-work. No. 21 is too tender to thrive in the open air in this country, ſo the plants ſhould be kept in pots; and if in the winter they are placed in a common frame, where they may have a large ſhare of free air in mild weather, and ſcreened from hard froſts, they will thrive better than with tender treatment. It is eaſily propagated by cuttings, which, if planted in May, will readily put out roots, and the young plants will flower the autumn following. See CONYZA, CREPIS, INULA.

ERI'GERUM, *ſ.* in botany. See SENECIO.

ERI'GONE, a daughter of Icarius, who hung herſelf when ſhe heard that her father had been killed by ſome ſhepherds whom he had intoxicated. She was made a conſtellation, now known under the name of *Virgo*. Bacchus deceived her by changing himſelf into a beautiful grape. *Ovid.*—A daughter of Ægiſthus and Clytemneſtra, who had by her brother Oreſtes, Penthilus, who ſhared the regal power with Timaſenus, the legitimate ſon of Oreſtes and Hermione. *Pauſanias.*

ERINA'CEA, *ſ.* in botany. See ANTHYLLIS.

ERINA'CEUS, the HEDGEHOG, in zoology; a genus of quadrupeds belonging to the order of feræ, the characters of which are, two upper fore-teeth diſtant; and two lower, approximate: upper tuſks five on each ſide; lower, three: grinders four on each ſide, in each jaw: back and ſides covered with ſpines. This animal has a very uncommon method of defending himſelf: being poſſeſſed of little ſtrength or agility, he does not attempt to fly from or aſſail his enemies; but erects his briſtles, and rolls himſelf up like a ball, expoſing no part of his body that is not furniſhed with ſharp weapons of defence; he will not unfold himſelf unleſs thrown into water: the more he is frightened or haraſſed, the cloſer he ſhuts himſelf up; and frequently diſcharges his urine, which has a very fetid ſmell. The females come in ſeaſon in the ſpring, and bring forth their young in the beginning of ſummer. They bring forth from three to five at a time. The young are of a whitiſh colour, and only the points of the briſtles appear above the ſkin. According to Gmelin, the Kalmucs tame them, and employ them as cats. They feed upon mice, fallen fruits, roots, and inſects: they are very fond of fleſh-meat, whether raw or roaſted. They frequent woods, and live under the trunks of old trees. They ſeldom come out of their holes in the day, but go about in queſt of food during the night. They eat but little, and can live very long without taking any nouriſhment. They do not lay up any ſtore of proviſions in harveſt; ſuch an inſtinct would be uſeleſs, as they are torpid in the winter. They lie under the undeſerved reproach of ſucking cattle and hurting their udders; but the ſmallneſs of their mouth renders that impoſſible. There are ſix ſpecies, as follow:

1. Erinaceus Europæus, the European or common hedge-hog; this is diſtinguiſhed by a long noſe, noſtrils bordered on each ſide with a looſe flap; ears ſhort, rounded, broad, and naked; eyes ſmall; legs ſhort, naked, and duſky; claws weak; the upper part of the face, ſides, and rump, are covered with a ſtrong coarſe hair, of a yelloviſh aſh-colour; the back with ſtrong ſharp cinerous ſpines, having a bar of black through their middle. This European ſpecies inhabits Madagaſcar, and moſt parts of Ruſſia, but is ſcarcely ever found in Siberia. He hunts during the night, but keeps retired during the day; feeds on roots, fruits, and inſects; reſides in ſmall thickets and hedges; neſtles in moſs, graſs, or leaves; and, during winter, he rolls himſelf up and ſleeps away that dreary ſeaſon.

2. Erinaceus auritus, the Siberian hedge-hog. This ſpecies, which inhabits the lower parts of the Volga and Ural, and as far Lake Baikal, are inferior in ſize to the preceding. They grow very fat, ſleep all the winter, live on inſects, even the moſt cauſtic, and will eat above a hundred cantharides without any injury: they roll themſelves up, and have all the manners of the common ſpecies. Their ears are large, open and oval, with ſoft whitiſh hairs within; tail ſhort; ſpines ſlender and brown, but white at their roots and points; the limbs and belly covered with a moſt elegant ſoft white fur. They bring their young, from four to ſeven, twice a-year.

3. Erinaceus inauris, the Guiana hedge-hog, native of South America. It is about eight inches long, deſtitute of ears, head thick, ſhort; ſpines cinereous tinged with yellow; hair ſoft, whitiſh-cheſnut over the eyes; tail ſhort; claws long and crooked.

4. Erinaceus Malaccenſis, the Malacca hedge-hog with pendulous ears. Inhabits Aſia; from it is procured the precious ſtone called *piedra del porco*.

5. Erinaceus ſetoſus, the Aſiatic hedge-hog: ears ſhort, with ſpines on the head, neck, tail, and withers only. Inhabits India and Madagaſcar; hardly ſix inches long; wallows in the mire, grunts like a hog, burrows; lies torpid ſix months, during which the hair falls off. Snout and whiſkers long; feet ſhort; ſpines whitiſh, pale cheſnut in the middle; hair white.

6. Erinaceus ecaudata, the tailleſs hedge-hog: ſnout very long, acute. Inhabits India and Madagaſcar; eight inches long; in its habit exactly reſembles the Aſiatic ſpecies. Mouth and eyes ſmall: ears rounded, longer than the laſt; ſpines black in the middle, covering the whole back and ſides; hair yelloviſh; feet tawney.

ERINA'CEUS, *ſ.* in botany. See HYDNUM.

ERIN'GO, *ſ.* in botany. See ERYNGIUM.

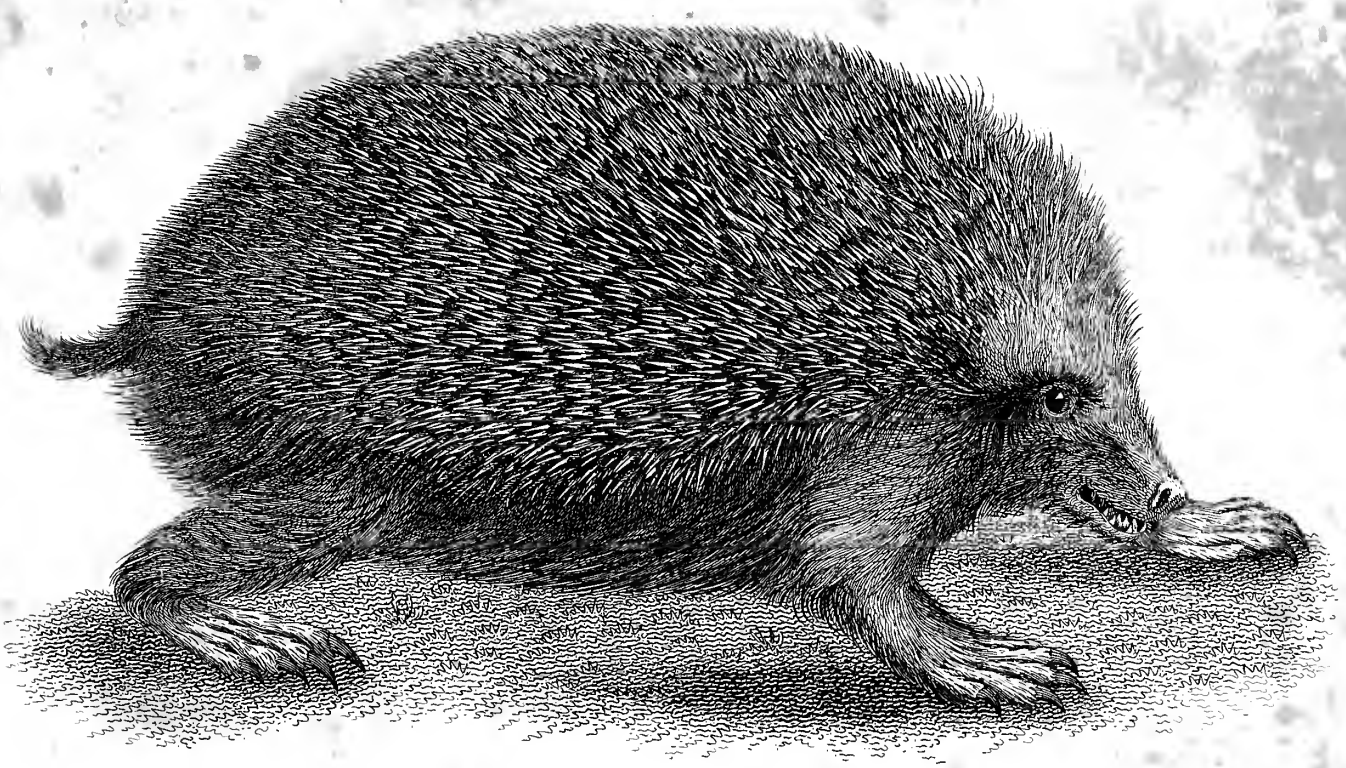
ERIN'NA, a Greek poeteſs, mentioned by different writers as a native of Leſbos, of Teios, of Rhodes, and of Tenos in Laconia. She is ſuppoſed to have been contemporary with Sappho, about the year before Chriſt 600; but the Chronicle of Euſebius places her two hundred and fifty years later. She was celebrated in ancient Greece, and ſeveral epigrams were written upon her, one of which ſpeaks of her as inferior to Sappho in lyrics, and ſuperior in hexameters. Some fragments are extant in her name, which are inſerted in the *Carmina Novem Poetarum Fœminarum*; Antwerp, 1568.

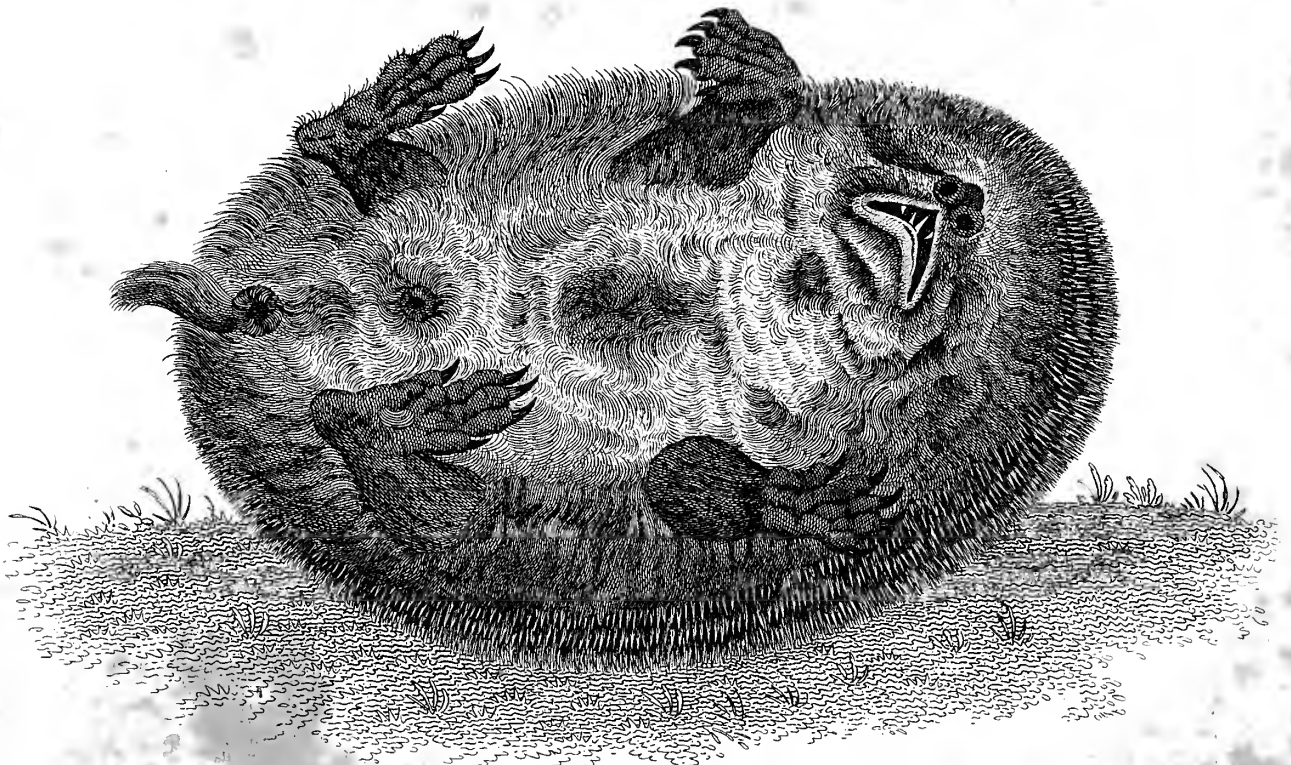
ERIN'NYS, one of the Eumenides. The word ſignifies the fury of the mind, ἐρις νου. *Virgil.*—A ſurname of Ceres, on account of her amour with Neptune under the form of a horſe. *Pauſanias.*

ERI'NUS, *ſ.* in botany, a genus of the claſs didynamia, order angioſpermia, natural order of perſonatæ, (pediculares, *Juſſ.*) The generic characters are—Calyx: perianthium five-leaved; leaflets lanceolate, upright, nearly equal, permanent. Corolla: one-petalled, unequal; tube ovate-cylindric, length of the calyx, bent back; border flat, five-parted; diviſions equal, obcordate. Stamina: filaments four, very ſhort, within the tube of the corolla, of which the two oppoſite ones are a little longer; antheræ ſmall. Piſtillum: germ ſomewhat ovate; ſtyle very ſhort; ſtigma headed. Pericarpium: capſule ovate, rolled up in the calyx, two-celled, gaping two ways. Seeds: numerous, ſmall.—*Eſſential Character.* Calyx five-leaved; corolla, border five-cleft, equal, with the lobes emarginate; upper lip very ſhort, reflex; capſule two-celled.

Species. 1. Erinus alpinus, or alpine erinus: flowers racemed, leaves ſpatulate. Root perennial. The root-leaves form a thick tuft cloſe to the ground; they are all linear-ſpatulate, pubeſcent, with a few ſerratures at the end on both ſides. Leaves on the ſtem alternate. Stems many, very ſimple, a hand high, round, pubeſcent, upright; the ſide ones barren and decumbent. Flowers alternate, ſeparated by leaves like thoſe on the ſtem, but ſmaller, and forming an upright ſimple raceme; calyx bell-ſhaped, five-parted, permanent; corolla funnel-ſhaped;

ſtigma





Meyer del.t

J.Pass sculp.t

The Common Hedgehog.

London Published as the Act directs Oct.r 27 1802 by J.Wilkes.

ſtigma with two ſmall roundiſh oppoſite ears; capſule ſmall, grooved on each ſide, the valves when ripe bifid to the middle. Partition doubled, formed by the edges of the valves bent in. Receptacle oblong, compreſſed a little, not faſtened to the partition. Seeds ovate, ferruginous, rugged with obſcure crowded tubercles. The leaves are about half an inch long, and one-eighth of an inch broad, of a dark green. The flower-ſtalk is ſcarcely two inches high; the flowers are in a looſe raceme, and purple. They appear in May, or earlier, and ſometimes are ſuecceded by ripe ſeeds in July. It is a deſirable little plant for the decoration of rock-work, growing in cloſe tufts, and producing its numerous lively purple flowers during moſt of the ſummer months. Native of Germany, of the Swiſs Alps, of the Pyrenees, and the ſouth of France.

2. Erinus Africanus, or African erinus: flowers lateral, ſeſſile; leaves lanceolate, ſomewhat toothed. Native of Africa.

3. Erinus Capenſis, or Cape erinus: flowers ſpiked, leaves linear, toothed. Perennial. Stem erect, round, pubeſcent, two feet high. Native of the Cape of Good Hope.

4. Erinus fragrans, or ſweet-ſcented erinus: leaves lanceolate-oblong, toothed; diviſions of the border entire. Native of the Cape of Good Hope.

5. Erinus Peruvianus, or Peruvian erinus: leaves lanceolate-ovate, ſerrate. Native of Peru; ſaid alſo to be found at the Cape.

6. Erinus maritimus, or ſea-ſide erinus: leaves lanceolate, quite entire, ſmooth; diviſions of the border cloven half way. 7. Erinus triſtris, or dull erinus: leaves oblong, gaſhed, toothed; diviſions of the border emarginate. Theſe flowers are of a dull colour, but ſweet. Both theſe are natives of the Cape.

8. Erinus laciniatus, or laciniate erinus: leaves laciniate. See BUCHNERA *Canadenſis*, and VERBENA *Aubletia*.

9. Erinus tomentoſus, or rough erinus: tomentoſe, ſtems procumbent, flowers ſeſſile, axillary. Stems trailing, about ſix inches long. Leaves ſmall, oval, placed on every ſide, very white, and woolly. At the joints juſt above the leaves come out the flowers, ſitting very cloſe to the ſtems; they are white, and are ſucceeded by round capſules. This plant has great reſemblance at a diſtance to ſea cudweed. It was ſent to Mr. Miller by Dr. Houſtoun from Vera Cruz.

10. Erinus Americanus, or American erinus: ſtem erect, leaves lanceolate, oppoſite, flowers looſely ſpiked, terminating. Stem upright, two feet high; towards the top two ſmaller branches, oppoſite, and erect; theſe and the middle ſtalk are terminated by looſe ſpikes of purple flowers, ſucceeded by oval capſules. Diſcovered by Dr. Houſtoun, at the ſame place.

11. Erinus fruteſcens, or ſhrubby erinus: ſtem upright, ſhrubby; leaves ovate-lanceolate, ſerrate, alternate; flowers axillary. Stem about four feet high, dividing into ſeveral ſmall hairy branches. Flowers ſingle, or two and three at a joint, ſeſſile, white, ſucceeded by round capſules.

12. Erinus verticillatus, or whorled erinus: ſtem branching, trailing; leaves ovate, ſerrate, ſmooth, oppoſite; flowers in whorls. Stems many, ſmooth, branching out very much on every ſide, about ſeven or eight inches long, and garniſhed with ſmall leaves. Flowers ſeſſile, white, making but little appearance, and ſucceeded by round capſules.

13. Erinus procumbens, or procumbent erinus: ſtems procumbent; leaves ovate, ſmooth; flowers ſolitary, axillary; peduncles longer. Stems ſeveral, trailing, ſix inches long, dividing into many ſmaller branches. Flowers bright yellow, on long ſlender peduncles, ſucceeded by oval capſules. This is a ſpecies of lindernia, according to Swartz, and a native of Hiſpaniola. See LINDERNIA.

Propagation and Culture. The firſt is propagated by parting the roots in autumn; they muſt have a ſhady ſituation and a loamy ſoil without dung, for in rich earth they are ſubject to rot. The Cape ſorts muſt be kept in the greenhouſe, dry ſtove, or glaſs caſe, and may be increaſed by cuttings. Thoſe from South Ameriea muſt be placed in the bark-ſtove. The eleventh being a ſhrubby plant, will continue ſeveral years, but the others are annual. They are propagated by ſeeds, ſown in pots filled with light earth, and plunged into a moderate hot-bed, where ſometimes they will come up in five or ſix weeks; but they frequently do not vegetate till the following ſpring, eſpecially when the ſeeds have been kept long. When the plants are fit to remove, they ſhould be each planted in a ſeparate ſmall pot filled with light earth, not too rich with dung, and then plunged into the bark-pit. When they have taken new root, treat them as other plants from the ſame countries, by admitting proper air when the weather is warm, and frequently refreſhing them with water; with this management the annual ſorts will flower in July and Auguſt, and often ripen their ſeeds in autumn, if they be brought forward early in the ſpring. The ſhrubby ſort muſt alſo frequently be refreſhed with water in winter, but not in large quantities, nor in very cold weather: the plants will flower and perfect their ſeeds the ſecond year. See CAMPANULA and LOBELIA.

ERIOCAU'LON, *ſ.* [from ἔριον, wool, and καυλος, Gr. a ſtalk.] In botany, a genus of the claſs triandria, order trigynia, natural order of enſatæ, (junci, *Juſſ.*) The generic characters are—Calyx: perianthium common, globoſe-depreſſed, imbricate; ſcales lanceolate, equal, permanent. Corolla: univerſal uniform, convex; proper three-petalled; petals equal, lanceolate, obtuſe, villoſe at the tip, attenuated at the baſe, and connected into a ſtyle-ſhaped pedicel which is hairy. Stamina: filaments three, capillary, ſitting on the germ; antheræ oblong, verſatile. Piſtillum: germ ſlender, ſuperior, under the ſtamens; ſtyles three, capillary, ſhort; ſtigmas ſimple. Pericarpium: none; calyx unehanged. Seeds: ſolitary, crowned with the corolla. Receptaculum: ehaffs of the ſize and figure of the calycine ſcales, one-flowered, very many. Other ſpecies muſt be ſurveyed before the character can be completed.—*Eſſential Character.* Calyx common, an imbricate head; petals three, equal; ſtamina upon the germ.

Species. 1. Eriocaulon triangulare, or triangular eriocaulon: culm triangular, leaves enſiform, head ovate. Linnæus ſays he could not diſcern the floſeules in Piſo's Herbarium, which is in the poſſeſſion of Burmann. Native of Braſil.

2. Eriocaulon quinquangulare, or quinquangular eriocaulon: culm quinquangular, leaves enſiform. 3. Eriocaulon ſexangulare, or ſexangular erioeaulon: culm hexangular, leaves enſiform. 4. Eriocaulon ſetaceum, or briſtly eriocaulon: culm hexangular, leaves ſetaeeous. Theſe are natives of the Eaſt Indies, and this of Cochinchina.

5. Eriocaulon decangulare, or ten-ſided eriocaulon: culm decangular, leaves enſiform. Leaves two, ſubulate, flat, channelled, jointed. Flowers in a head, with male flowers in the diſk, and female in the eireumference. The character of the genus remains to be examined in the other ſpecies. Hope has very well deſcribed this. The remaining ſpecies muſt be ſeen, before the character ean be corrected. Native of North America, in the ſwamps.

6. Eriocaulon quadrangulare, or quadrangular eriocaulon: culm quadrangular, leaves enſiform, head of flowers globular, truncate at the baſe. This is an annual herb, with an upright naked four-cornered culm, eight inches high. Leaves ſhort, ſmooth, few. Heads of flowers whitiſh, flattiſh at the baſe, with roundiſh ſcales, attenuated at the bottom, one-flowered, cloſed. Petals two, ſubconcave, blunt at the tip, toothed. Seeds three, ovate. Common every where in Coehin-china.

7. Eriocaulon ſeptangulare, or ſeven-angled eriocaulon: found in Ireland, by Dr. Walter Wade of Dublin, and communicated to the Linnæan Society in 1802. It had never

never before been ſeen but in the Iſle of Skye. Dr. Wade obſerved it in September 1801, decorating the edges of all the lakes in the romantic diſtrict of Cunnamara. He remarked the number of angles in the ſtem to vary from ſix to ten; but in general they were limited to ſeven.

ERIOCE'PHALUS, *ſ.* [from εριον, wool, and κεφαλη, Gr. a head.] In botany, a genus of the claſs ſyngeneſia, order polygamia neceſſaria, natural order of compoſitæ nucamentaceæ, (corymbiferæ, *Juſſ.*) The generic characters are—Calyx: common upright; ſcales ten, ovate, equal, converging, of which the five exterior are keeled, the interior flat. Corolla: compound rayed; corollules hermaphrodite, twice as many in the diſk; females five in the ray; proper of the hermaphrodite funnel-form; border five-cleft, patulous; of the ray ligulate, obcordate, with three-lobed, equal, tips. Stamina: in the hermaphrodites; filaments five, capillary, very ſhort; antheræ cylindric, tubular. Piſtillum: in the hermaphrodites, germ very ſmall, naked; ſtyle ſimple; ſtigma two-cleft, ſharp; in the females, germ ovate, naked; ſtyle ſimple; ſtigma acuminate, inflex. Pericarpium: none; calyx ſcarce changed. Seed: to the hermaphrodites, none; females ſolitary, obovate, naked. Receptaculum: naked, flat; or elſe a down of the calyx in a double row is interſperſed both between the hermaphrodite and female floſcules.—*Eſſential Character.* Receptaculum ſubvilloſe; down none; calyx ten-leaved, equal; in the ray five floſcules.

Species. 1. Eriocephalus Africanus, or cluſter-leaved eriocephalus: leaves entire and divided, flowers corymbed. This plant has a ſhrubby ſtalk from four to ſix feet high, putting out many ſide branches the whole length; leaves woolly, coming out in cluſters, ſome taper and entire, others divided into three or five parts, which ſpread open like a hand: they have a ſtrong ſmell when bruiſed approaching to that of lavender cotton, but not quite ſo rank. The flowers are produced in ſmall cluſters at the ends of the branches, and ſtand erect. The female florets which compoſe the ray form a hollow, in the middle of which the hermaphrodite florets forming the diſk are ſituated; the border is white, with a little reddiſh caſt on the inſide, and the diſk is of a purpliſh colour. The flowers appear in autumn, but do not produce ſeeds in this country. Cultivated in 1732, by James Sherard, M. D. at Eltham. It flowers from January to March.

2. Eriocephalus racemoſus, or ſilvery-leaved eriocephalus: leaves linear, undivided; flowers racemed. This has the ſtature and appearance of E. Africanus, but all the leaves are undivided. Gærtner affirms, that there is no veſtige whatever of the outer calyx in this ſpecies. The receptacle is flat, and has a copious ſilky down on it, of a whitiſh ſtraw-colour, and longer than the florets. Seeds of the females oblong, narrowed downwards, compreſſed, three-ſided, hairy or ſparingly woolly, but otherwiſe deſtitute of all down. This was cultivated by Mr. Miller in 1758. It flowers in March and April. Both are natives of the Cape of Good Hope.

Propagation and Culture. This plant is propagated by cuttings, which may be planted any time from May to the middle of Auguſt; for, if they are planted later in the ſeaſon, there will not be time for them to get good root before the winter. Theſe cuttings ſhould be planted in ſmall pots filled with light earth, and plunged into a very moderate hot-bed, where they ſhould be ſhaded from the ſun till they have taken root; they muſt be refreſhed with water two or three times a-week, but they ſhould not have too much at each time, for much moiſture is very hurtful to theſe plants. When the cuttings have taken root, they ſhould be gradually inured to the open air, to prevent their ſhoots from being drawn up weak; afterwards they ſhould be removed into the open air, and placed in a ſheltered ſituation, where they may remain till October, when they muſt be removed into an airy glaſs-caſe, that they may have as much ſun as poſſible, and enjoy the free air in mild weather, but ſecured from froſt and damp air, either of which will ſoon deſtroy them. During the winter they muſt be ſparingly watered, for the reaſon before given; but, in the ſummer, when the plants are placed in the open air, they will require to be frequently refreſhed with water in hot weather. Theſe plants, retaining their leaves all the year, add to the variety of exotics in the winter ſeaſon. See ERICA BRUNIADES, CENTAUREA, and HIPPIA.

ERIOPH'OROS, *ſ.* in botany. See BOMBAX.

ERIOPH'ORUM, *ſ.* [from εριον, wool, and φερω, Gr. to bear; wool or cotton-bearing; the ſeeds having a long, white, downy, ſubſtance affixed to them.] In botany, a genus of the claſs triandria, order monogynia, natural order of calamariæ, (cyperoideæ, *Juſſ.*) The generic characters are—Calyx: ſpike on all ſides imbricate; ſcales ovate-oblong, flat-inflected, membranaceous, looſe, ſharp-pointed, ſeparating the flowers. Corolla: none. Stamina: filaments three, capillary; antheræ upright, oblong. Piſtillum: germ very ſmall; ſtyle filiform, length of the calycine ſcales; ſtigmas three, longer than the ſtyle, bent backwards. Pericarpium: none. Seed: three-ſided, acuminate, furniſhed with villoſe hairs longer than the ſpike. —*Eſſential Character.* Glumes chaffy, imbricate every way; corolla none; ſeed one, ſurrounded with a very long wool.

Species. 1. Eriophorum vaginatum, mountain or ſingle-ſpiked cotton-graſs: culms ſheathed round, ſpike ſcarioſe. Root-leaves obſcurely three-cornered, ſharp, ſtreaked on two ſides; convex on one ſide, flat on two ſides. It differs very obviouſly from the third ſpecies; the root being not creeping, but more matted; the leaves much finer, and conſequently more apt to grow in tufts; the ſheath of the upper ſtem-leaf in particular is remarkably inflated, and it never produces more than one ſpike, which is upright. Native of bogs in cold barren ſituations, in many parts of Europe. Not ſo general with us, but in ſome places equally common. Near London, on Shirley-common, by Croydon; near Lynn; Birmingham-heath; frequent in all the northern counties; Elſemere-meers in Shropſhire; Pillinmoſs in Lancaſhire. It flowers ſomewhat earlier than the *anguſtifolium*, No. 3. but produces its down about the ſame time. Sheep are very fond of it, whence in Weſtmoreland they call it *moſs-crops*. As they do alſo the third ſpecies, not diſtinguiſhing them. Ray calls it *kair's-tail ruſh*.

2. Eriophorum polyſtachion, or many-ſpiked cotton-graſs: culms columnar, leaves flat, ſpikes peduncled. Linnæus confounds this and the next ſpecies together; and refers to the firſt figure of Vaillant only as a variety of his polyſtachion; but, if he had ever ſeen both plants together, he would doubtleſs have made them diſtinct ſpecies. The following particulars may ſerve to ſhow in what our plant differs from E. polyſtachion. 1. The root of that is not creeping. 2. The culm is very erect. 3. The leaves are ſhort and flat. 4. The ſpikes are many, upon ſlender foot-ſtalks, and pendulous. 5. The involucre is ſhorter than the ſpike.

3. Eriophorum anguſtifolium, or narrow-leaved cotton-graſs: culms columnar, leaves channelled, three-ſided, ſpikes peduncled. Our Engliſh writers have followed Linnæus in confounding this with the foregoing, till Mr. Dickſon diſtinguiſhed them. Stem from nine inches to a foot or more in height, upright, ſmooth, with two joints projecting a little, covered throughout its whole length with the ſheaths of the leaves; thoſe next the root are of a cheſnut colour, ſhort, lanceolate, ſtreaked, marked with tranſverſe lines, which give them a reticulated appearance; the ſucceeding leaves at their baſe cloſely embracing the ſtalk, from two to three lines in breadth, about ſeven inches or more in length, gradually tapering to the extremity, convex on one ſide, concave on the other, and ſmooth; the uppermoſt leaves flatter, much ſhorter, and manifeſtly keeled; ſheaths nearly of an equal thickneſs throughout, where a leaf goes off more looſely connected, and marked with a fiſſure filled by a membrane. Floral leaves three or four, of unequal lengths, forming ſheaths

at

at the bottom, terminate the ſtalk, from the axils of which the ſpikelets proceed. Theſe are from two to ſeven (generally about three), ovate, firſt upright, afterwards pendulous. Gærtner deſcribes the fruit as a ſmall coriaceous-cruſtaceous nut, of an obovate form, three-cornered, ſmooth or obſcurely ſtreaked, of a reddiſh cheſtnut colour, one-celled, valveleſs, clothed at the baſe with a white ſilky down, quite ſimple, and twelve times as long as the nut. Seed ſingle, ſubelliptic, obſcurely three-cornered, pale. In Germany, and the more northern parts of Europe, the down has been manufactured into various articles of dreſs, paper, and wicks for candles. In ſome parts of Sweden the peaſants ſtuff their pillows with it, whence it is called *poor-man's pillow:* but it becomes brittle when quite dry. Early in the ſpring, cattle crop and injure the leaves, before the graſſes are ſufficiently grown. It is common on moors and boggy ground; inſomuch that they are often white all over with it in June and July, when it is in ſeed. It flowers in April and May.

4. Eriophorum Virginicum, or Virginian cotton-graſs: culms leafy, columnar, leaves flat, ſpikes upright.—Native of Virginia.

5. Eriophorum cyperinum, or cyperus cotton-graſs: culms columnar leafy, panicle ſuperdecompound proliferous, ſpicules moſtly in threes. This has altogether the ſtature of Cyperus, but the ſpikelet of Scirpus, except that the ſeeds as they ripen produce a dun-coloured or teſtaceous cotton, ſcarcely longer than the ſpikelets. Native of North America.

6. Eriophorum alpinum, or alpine cotton-graſs: culms naked three-cornered, ſpike ſhorter than the down. Native of the mountains of Lapland, Sweden, Denmark, Sileſia, Carniola, Switzerland; flowering in June and July. It was found by Mr. Brown and Mr. Donn, in a moſs about three miles eaſt of Forfar, in the ſhire of Angus, Scotland. A ſpecimen of it from this place was preſented to the Linnæan Society by Mr. Teaſdale, April the 3d, 1792.

Propagation and Culture. Theſe being bog-plants, are ſeldom preſerved in gardens. They may however be planted in pots filled with bog-earth, ſet in pans wherein water is kept conſtantly; or by the ſide of ponds or other waters.

ERIOPH'ORUS. See ANDRYALA, BOMBAX, CARDUUS, and SCILLA.

ERIO'PILA. See DUROIA.

ERIPH'ANIS, a female Greek, famous for her poetical compoſitions. She was extremely fond of the hunter Melampus, and to enjoy his company ſhe accuſtomed herſelf to live in the woods.

ERIPH'YLE, a ſiſter of Adraſtus king of Argos, who married Amphiaraus. She was daughter of Talaus and Lyſimache. When her huſband concealed himſelf that he might not accompany the Argives in their expedition againſt Thebes, where he knew he was to periſh, Eriphyle ſuffered herſelf to be bribed by Polynices with a golden necklace which had been formerly given to Hermione by Venus, and ſhe diſcovered where Amphiaraus was. This treachery of Eriphyle compelled him to go to the war; but before he departed, he charged his ſon Alcmæon to murder his mother as ſoon as he was informed of his death. Amphiaraus periſhed in the expedition, and his death was no ſooner known than his laſt injunctions were obeyed, and Eryphile was murdered by the hands of her ſon. *Homer.*

E'RIS, the goddeſs of diſcord among the Greeks: the ſame as the Diſcordia of the Latins.

ERISICH'THON, in fabulous hiſtory, a Theſſalian, ſon of Triops, who derided Ceres, and cut down her groves. This impiety irritated the goddeſs, who afflicted him with continual hunger. He ſquandered all his poſſeſſions to gratify the cravings of his appetite, and at laſt he devoured his own limbs for want of food. His daughter had the power of transforming herſelf into whatever animal ſhe pleaſed, and ſhe made uſe of that artifice to maintain her father, who ſold her, after which ſhe aſſumed another ſhape and became again his property. *Ovid.*

ERIS'KAY, one of weſtern iſlands of Scotland, ſeparated from ſouth Viſt by a narrow ſtrait, called *Eriſkay Sound:* about five miles in circumference.

ERISTHA'LES. See CNICUS.

ERITH'ALIS, *ſ.* [the name of an herb in Pliny; from ερίθαλης, Gr. full of verdure.] In botany, a genus of the claſs pentandria, order monogynia, natural order of rubiacæ, (*Juſſieu.*) The generic characters are—Calyx: perianthium one-leafed; ſuperior, pitcher-form, five-toothed, permanent, (ten-toothed, minute, five-cornered, *Swartz*;) Corolla: one petalled, five-parted: tube very ſhort; diviſions lance-ſhaped, long, bent back. (Petals five, linear, obtuſe, patulous, *Swartz.*) Stamina: filaments five, (ſix, eight, ten, from the baſe of the calyx, *Swartz*;) ſubulate, patulous, ſcarce the length of the corolla; anthers oblong, linear, erect, *Swartz.* Piſtillum: germ inferior, roundiſh: ſtyle filiform, compreſſed above, length of the ſtamens; ſtigma ſharp, (bifid, *Swartz.*) Pericarpium: berry globoſe, crowned, ten-celled, (eight or ten-celled, *Gærtner*; ſlightly ten-grooved, *Swartz.*) Seeds ſmall, (in each cell one, pendulous, ovate, compreſſed like a lens, *G.*)—*Eſſential Character.* Corolla: five-parted, with the diviſions bent back; Calyx pitcher-ſhaped; berry ten-celled, inferior.

Species. 1. Erithalis fruticoſa, or ſhrubby erithalis: leaves oppoſite; corymbs compound. This is an upright elegant branching tree, fifteen feet in height. Leaves ſubovate, blunt with a ſmall point, ſhining, quite entire, deep green, paler underneath, petioled, three inches long. Flowers numerous, caducous, with white petals, moſtly ſix-ſtamened with a ſix-cleft calyx and corolla, ſmelling exactly like the common Syringa. Berries ſmall and purple, (black, *Swartz.*) Seeds about nine, but uncertain in their number; (in each cell one, rufeſcent, *Gærtner.*) Perhaps both the ſpecies of Browne, are but varieties of this. Native of Jamaica, Martinico, &c. Jacquin deſcribes another, which is a native of Curaçao, and probably a variety of this ariſing from its growing in the clefts of rocks, where there is no earth. It is a ſhrub, two feet high, with procumbent diffuſed branches; the leaves are thicker and numerous; the berry and flowers ſmaller; the former entirely void of ſcent, the latter whitiſh or very ſeldom purple. According to Swartz, it varies with large ovate leaves, and all the parts larger. The berry, as Gærtner obſerves, may with Jacquin be conſidered as one-celled.

2. Erithalis polygama, or polygamous erithalis: leaves obovate; flowers axillary, males cymed, hermaphrodites ſolitary. Native of the Society Iſles. The variety *timonius*, has narrower leaves.

ERITHRÆ'A, *ſ.* in botany. See GENTIANA CENTAURIUM.

ERIS'TICAL, *adj.* [ερις, Gr.] Controverſial; relating to diſpute; containing controverſies.

ERI'TRI, a town of Aſiatic Turkey, in the province of Natolia: thirty-ſix miles weſt of Smyrna.

ERITZ'KA, a town of Ruſſia, in the government of Irkutſch: twenty miles eaſt of Kireńſk.

ER'IVAN, or PERSIAN ARMENIA, or GREATER ARMENIA, or EASTERN ARMENIA, a province of Perſia, about 200 leagues in length, and ſixty in breadth. The country is mountainous, interſected with fertile vallies; the air is healthy, and the wine excellent; the winter is long and rough, with frequent ſnow, which ſometimes falls in June, and even is ſometimes found in July; fruit grows ſlowly, and olives do not flouriſh. Game and fiſh abound: this is the country in which Noah's ark is ſaid to have reſted after the flood, on mount Ararat, called by the Perſians Agri, and by the Armenians Macis, or Mezeſan-ver. This province is bounded on the north by Georgia, on the eaſt by Schirvan and a ſmall province called Mougan, on the ſouth by Aberbeitzan, and on the weſt by Turkiſh Armenia. The principal towns are Erivan and Nachivan. See ARMENIA, vol. ii. p. 194—197.

ER'IVAN, or IRVAN, or IRIVAN, a city of Aſia, and capital of Greater Armenia, or Erivan, ſituated in a plain, ſurrounded with mountains, and watered by two ſmall rivers; large, dirty, and ill-built, and but indifferently peopled: the ramparts are of earth; the fortreſs is encompaſſed with a wall of bricks, in which is a palace for the governor, and 800 houſes, only inhabited by Perſians; the Armenians have ſhops there, but muſt not remain during the night. The churches are ſmall, and half buried in the ground, reſembling catacombs: in the town and environs are twenty-eight convents for devotees of both ſexes, but they are poorly endowed. Lat. 40. 20. N. lon. 62. E. Ferro.

ERIZ'ZO (Sebaſtian), a noble Venetian, diſtinguiſhed for his knowledge of the medallic ſcience. He publiſhed in 1559, in Italian, a Diſcourſe upon ancient Medals, with the particular Explanation of many Reverſes, which was much eſteemed for its erudition. He alſo publiſhed, in 1567, a moral work, entitled *Sei Giornate*. He was likewiſe the author of a treatiſe On Logic, in Italian; a tranſlation of Plato's Dialogues; a diſcourſe Of Civil Governments; and ſome other pieces. He died in 1585.

ERKE, *adj.* [eapȝ, Sax.] Idle; lazy; ſlothful. An old word whence we now ſay *irkſome*.

For men therein would hem delite;
And of that dede be not *erke*,
But oft tithes haunt that werke. *Chaucer.*

ER'KELENS, a town of Germany, in the circle of Weſtphalia, in the duchy of Juliers; it made a part of Guelders before the year 1719: ten miles north of Juliers. Lat. 51. 8. N. lon. 23. 50. E. Ferro.

ER'KOOM, an Abyſſinian bird, deſcribed by Mr. Bruce. He ſays, that though not eaſily raiſed, it flies both ſtrong and far. It has a rank ſmell, and is ſaid in Abyſſinia to feed upon dead carcaſes. This, however, Bruce thinks a miſtake, as he never ſaw it following the army, nor approaching a dead carcaſe; and as often as he had occaſion to open this bird, he found in its ſtomach nothing but the green ſcarabeus beetle. It builds in large thick trees, always, if it can, near churches; has a covered neſt like that of a magpie, but four times as large as the cagle's. It places its neſt firm upon the trunk, without endeavouring to make it high from the ground: the entry is always on the eaſt ſide.

ER'LA, a town of Germany, in the archduchy of Auſtria: four miles ſouth-weſt of Vienna.

ER'LA (Cloſter), a town of Germany, in the archduchy of Auſtria: ſix miles eaſt of Ens.

ER'LACH, a town of Germany, in the archduchy of Auſtria: eight miles weſt of Efferding.

ER'LACH, or CERLIER, a town of Swiſſerland, in the canton of Bern, with a bailiwic, on the borders of the Lake of Bienne: fifteen miles weſt-north-weſt of Bern.

ER'LANG, a town of Germany, in the circle of Franconia, and principality of Culmbach, divided into Old and New, the firſt founded by Charlemagne, the latter by the margrave Chriſtian Erneſt, in 1686. It has ſeveral churches, an univerſity, and a palace: ten miles north of Nuremberg, and nineteen ſouth of Bamberg. Lat. 49. 34. N. lon. 28. 46. E. Ferro.

ER'LAU, or EGER, a town of Hungary, ſurrounded with walls, and defended by a caſtle. In 1552, it withſtood the Turks; but in 1596, it ſurrendered to them by capitulation. In 1606 it was ſurpriſed by the Imperialiſts; and in 1704, it was taken by prince Ragotſki. It is the ſee of a biſhop. Forty miles eaſt of Gran, and 120 eaſt-ſouth-eaſt of Vienna.

ER'LEBACH, a river of Germany, which riſes in the duchy of Stiria, ſix miles below Ips.

ER'LEBACH, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz, on the Main: three miles north-north-weſt of Clingenberg.

ER'LENBACH, a town of Germany, in the circle of Franconia, and county of Wertheim: ten miles north-north-eaſt of Wertheim.

ER'MELAND (biſhopric of), a country ſurrounded by Pruſſia, formerly ſubject only to the biſhop and chapter, but now become a province of Pruſſia. The principal towns are Frauenburg, Braunſburg, and Heilſburg.

ER'MELIN, *ſ.* [diminutive of ermin; *armelin*, Fr.] An ermine:

Silver ſkins,
Paſſing the hate ſpot *ermelins*. *Sidney.*

ER'MENAK, a town of Aſiatic Turkey, in the province of Caramania: ſixty-three miles ſouth of Cogni.

ER'MIJA, a town of Spain, in the province of Biſcay: ſixteen miles eaſt ſouth eaſt of Bilbao.

ER'MIL, a town of Ruſſia, in the government of Tamboy: forty-four miles ſouth of Tamboy.

ER'MINE, *ſ.* [*hermine*, Fr. from *armenius*, Lat.] The white ſtoat, a ſpecies of weeſel. See the article MUSTELA. The ermine is an emblem of purity; for it is ſaid that if a ring of mud or dirt be made round them, they will die rather than daub themſelves to eſcape:

A lady's honour may be touch'd;
Which, nice as *ermines*, will not bear a foil. *Dryden.*

ER'MINE, in heraldry, denotes a white field or fur, powdered or interſperſed with black ſpots, called *powdering*. See HERALDRY.

ER'MINE, *ſ.* an order of knights, inſtituted in 1450, by Francis I. duke of Bretagne, and formerly ſubſiſting in France. The collar of this order was of gold, compoſed of ears of corn in ſaltier; at the end of which hung the ermine, with this inſcription, *A ma vie*. The order expired when the dukedom of Bretagne was annexed to the crown of France.

ER'MINED, *adj.* Clothed with ermine, or fur of the white ſtoat:

Arcadia's counteſs, here in *ermin'd* pride,
Is there Paſtora by a fountain ſide. *Pope.*

ER'MINE-STREET, one of the noted Roman highways, in England, from St. David's to Southampton.

ERMS, a river of Germany, which runs into the Danube, four miles ſouth-weſt of Nurtlingen, in the circle of Swabia.

ERMSLE'BEN, a town of Germany, in the circle of Lower Saxony, and principality of Halberſtadt: fourteen miles ſouth-eaſt of Halberſtadt.

ERNA'NI, a town of Spain, in the province of Guipuſcoa: five miles ſouth of Sebaſtian.

ERNA'TIA, a town of Aſiatic Turkey, in the province of Natolia: ſixteen miles north-weſt of Satalia.

ER'NE, or ERON, do immediately flow from the Saxon eapn, eapn, a cottage, or place of retirement. *Gibſon*.

ER'NE, a river in Ireland, which riſes in the northern part of the county of Longford, croſſes the county of Cavan from north to ſouth, paſſes through Lough Erne, in the county of Fermanagh, and empties itſelf into the Bay of Donegal, three miles below Bally Shannon.

ERNE (Lough), a lake of Ireland, in the county of Fermanagh, or more properly two lakes connected.

ERNE'E, a town of France, and principal place of a diſtrict, in the department of the Mayenne, on a river of the ſame name; containing about 2400 inhabitants: five leagues north-north-weſt of Laval, and four weſt of Mayenne.

ERNE'E, a river of France, which runs into the Mayenne, two miles north of Laval.

ERNES'TI (John Auguſtus), doctor of divinity, and firſt profeſſor of theology in the univerſity of Leipſic, born on the 4th of Auguſt, 1707, at Tennſtadt, where his father was ſuperintendant. He ſtudied at Pforta, where he ſoon gave proofs of his great talents; repaired afterwards to Wittenberg, and then to Leipſic, where he was made doctor and profeſſor of theology. Though engaged in laborious occupations, he attained, with a ſound conſtitution, to the great age of ſeventy; but after that period the infirmities of age gradually aſſailed him till the time of his death, which took place on the 11th of September, 1781. His works were received with ſo much approbation,

tion, that they were ſoon reprinted in Holland, England, and France. His editions of the claſſical authors, in particular, were in ſo much requeſt, that he was under the neceſſity of refuſing many offers made to him by foreign bookſellers.

ERNO'DEA, *ſ.* [from ερωδης, Gr. branched; ſo named by Swartz.] In botany, a genus of the claſs tetandria, order monogynia. The generic characters are—Calyx: perianthium four-parted, ſmall, ſuperior; ſegments erect, acute, equal, permanent. Corolla: one petalled, ſalver ſhaped: tube four-cornered, elongated; border four-parted; ſegments lanceolate, revolute. Stamina: filaments four, inſerted in the middle of the tube, awl-ſhaped, longer than the corolla; antheræ erect, acuminate. Piſtillum: germ four-cornered, inferior; ſtyle filiform, longer than the ſtamens; ſtigma obtuſe, emarginate. Pericarpium: berry roundiſh, crowned by the calyx, two-grooved, two-celled. Seeds: ſolitary, hemiſpherical, ſtriated.—*Eſſential Character.* Calyx four-parted; corolla one-petalled, ſalver-ſhaped; berry two-celled; ſeeds ſolitary.

Ernodea littoralis, a ſingle ſpecies. It is a native of Jamaica, frequent near the ſhore in the pariſh of St. George, running three or four feet or more along the ground, throwing out a few ſpreading branches as it creeps along. The leaves are oblong, pointed and ſtiff; the flowers few, ſingle, at the axils of the upper leaves. Browne named this plant *Knoxia*, from Knox, who reſided many years in the iſland of Ceylon, and publiſhed an account of it.

ERN'SPACH, a town of Germany, in the circle of Franconia, and principality of Hohenlohe; ſix miles north of Ohringen.

ERN'STEIN, a town and caſtle of Germany, in the circle of the Lower Rhine, and electorate of Cologne: eight miles eaſt of Lintz.

ERN'THAL, a town of Germany, in the circle of Upper Saxony, and lordſhip of Schonberg: ſeven miles weſt of Chemnitz.

ERN'STHOFEN, a town of Germany in the circle of the Upper Rhine, and principality of Heſſe Darmſtadt: ten miles ſouth of Darmſtadt.

To ERO'DE, *v. a.* [*erodo*, Lat.] To canker, to eat away; to corrode.—The blood, being too ſharp or thin, *erodes* the veſſel. *Wiſeman.*

ERO'DENTS, *ſ.* [from *erodo*, Lat. to eat away.] Thoſe ſubſtances which eat away or deſtroy other bodies, by means of their proper menſtrua.

ERO'DIUM, *ſ.* [ερωδιος, Gr. is the name of the crane in Ariſtotle, whence this genus is ſo called on account of the long beak to the fruit.] In botany, a genus of the claſs monadelphia, order pentandria, natural order of gruinales, (gerania, *Juſſ.*) The generic characters are—Calyx: perianthium five-leaved; leaflets ovate, acute, concave, permanent. Corolla: petals five, obcordate or ovate, ſpreading, large; nectary, five ſcales alternate with the filaments; and melliferous glands placed at the baſe of the ſtamens. Stamina: filaments five, awl-ſhaped, connected at the baſe with the ſcales into the ſhape of a pitcher, but ſpreading at top, ſhorter than the corolla; antheræ, oblong, verſatile. Piſtillum: germ five-cornered, beaked; ſtyle awl-ſhaped, longer than the ſtamens, permanent; ſtigmas five, reflex. Pericarpium: capſule five-grained, beaked, the cells opening inwards, each having a long tail fixed to it, which becomes ſpiral, and is hairy or bearded on the inſide. Seeds: ſolitary, (ſeldom two together,) ovate-oblong.—*Eſſential Character.* Calyx five-leaved; corolla five-petalled; nectary, five ſcales, alternate with the filaments, and glands at the baſe of the ſtamens; fruit five-grained, with a ſpiral beak, bearded on the inſide.

Species. I. Leaves compound or pinnatifid. 1. Erodium abſynthoides, or wormwood-leaved crane's-bill: cauleſcent; peduncles four-flowered or thereabouts; leaves interruptedly bipinnate laciniate, ſegments linear. The genus geranium was firſt ſeparated into three genera by monſieur l'Heritier. Of theſe this of erodium is one, pelargonium is a ſecond, and the third retains the old name of geranium. The diviſion is convenient on account of the prodigious number of ſpecies, but they muſt ſtill be conſidered as making only one natural genus. The firſt ſpecies ſeems to differ from the next in being cauleſcent, and in having the ſegments of the leaves linear and ſubvilloſe, not oblong and ſilky, as in that. Found in Armenia by Tournefort, and on mount Olympus by John Sibthorp, M. D.

2. Erodium chryſanthum, or golden-flowered crane's-bill: almoſt ſtemleſs; peduncles four-flowered; leaves decompoundly pinnate, laciniate, ſilky. This is very diſtinguiſhable by its yellow flowers. Found on mount Parnaſſus by Sibthorp.

3. Erodium trichomanifolium, or maidenhair-leaved crane's-bill: ſtemleſs; ſcapes leafleſs, four-flowered; leaves bipinnatifid hirſute. It may be doubted whether this be any thing more than a variety of the preceding. It differs, however, in having the flowers fleſh-coloured marked with lines, the leaves ſmaller and leſs cut, the ſcapes leafleſs and radical; whereas E. chryſanthum becomes branched when in flower. Found on mount Libanus by Billardiere.

4. Erodium pulverulentum, or hoary-leaved crane's-bill: cauleſcent; peduncles many-flowered; leaves decompoundedly laciniate, mealy, hoary. The plant is wholly covered with frequent ſhort villoſe hairs, whence it has the appearance of being duſty. It is certainly allied to the firſt and ſecond ſpecies, from which it differs in its duſty habit, in having the leaves decompoundedly laciniate, not interruptedly bipinnate, the flowers more numerous in the umbel, and the fruits only one-third of the length. Found by Louiche Desfontaines in the kingdom of Tunis.

5. Erodium craſſifolium, or upright crane's-bill: umbels many-flowered; leaves pinnatifid-laciniate thick; ſegments linear. In appearance this reſembles pelargonium myrrhifolium. It differs from the three next, in having thick leaves, pinnatifid not interruptedly pinnate, bractes larger, and roundiſh not lanceolate, the herb cauleſcent, and the root more ſlender not thick. Found in the iſland of Cyprus by Sibthorp; flowers in April and May.

6. Erodium fœtidum, or ſtinking crane's-bill: almoſt ſtemleſs; ſcapes radical, many-flowered; leaves interruptedly bipinnatifid, petals roundiſh. All the leaves are heaped about the root; they are hoary with hairs, the whole forming a triangle. Lobel reports it to be abominably fetid. L'Heritier ſays it is ſingular in having a very ſtrong nauſeous ſmell like ſome of the claſs Syngeneſia; and according to Gouan, it has a ſtrong ſmell, but neither nauſeous nor muſky. Native of the country about Montpellier. It ſeems to have been cultivated here in the time of Parkinſon.

7. Erodium macrademum, or Spaniſh crane's-bill: ſubcauleſcent; ſcapes radical, many-flowered; leaves interruptedly bipinnatifid, petals ovate. This is allied to the preceding; the herb is entirely the ſame. The leaves, which are very much alike, are more finely laciniated and more ſlender in this; this has alſo a turpentine or muſky ſmell. Native of Spain.

8. Erodium ſupracanum, or ſilky-leaved crane's bill: almoſt ſtemleſs; ſcapes radical, two-flowered or thereabouts; leaves interruptedly bipinnatifid, thickiſh, ſilk-hoary on the upper ſurface. This is very nearly allied to the two preceding, and to E. romanum. Found in Montſerrat in Catalonia by Brouſſonet, Sibthorp, and Pourrett.

9. Erodium petroſelinum, or parſley-leaved crane's-bill: peduncles two-flowered; leaves pinnate; leaflets pinnatifid; ſegments linear. This has the habit of the three laſt, from which, however, it differs in having pinnatifid leaves, not interruptedly ſo, and elongated ſtems. Found on the ſandy coaſts of Barbary by Poiret.

10. Erodium alpinum, or alpine crane's-bill: peduncles

cles many-flowered; leaves interruptedly pinnatifid-laciniate. Root perennial, running very deep into the ground; lower leaves ſmooth and on very long footſtalks; ſtems a foot and an half high, with leaves of the ſame form, but ſmaller and oppoſite; flowers purple, many together on very long peduncles; the calyx is awned; the petals are about twice as large, and entire. Native of Italy. The ſeeds were ſent to Mr. Miller by Micheli. It flowers here in June, but the ſeeds do not ripen in England.

11. Erodium Romanum, or Roman crane's-bill: ſtemleſs; ſcapes radical, many-flowered; leaves pinnate; leaflets pinnatifid. Native of Italy, about Rome, on the Pyrennees, alſo of Provence. It was cultivated in the botanic garden at Chelſea, in 1724.

12. Erodium cicutarium, or hemlock-leaved crane's-bill: peduncles many-flowered; leaves pinnate; leaflets ſeſſile pinnatifid. This ſpecies varies extremely, from nearly ſmooth to very hairy, and from very large and branched, with many a flowered umbel, to ſmall and nearly ſimple, with few flowers.

β. Geranium pimpinellæ-folio of Dillenius is a remarkable variety; the petals irregular, the two upper ſhorter, rounder, and marked with a greeniſh ſpot at the baſe. The common ſort is found all over Europe, in Africa, Aſia, North America, and the iſland of Madeira. The laſt-mentioned varicty has been found in England near Hackney, and in ſeveral parts of Suffolk.

13. Erodium moſchatum, or muſk crane's bill: peduncles many-flowered; leave pinnate; leaflets ſubpetioled, unequally gaſhed. This is very like the preceding, but has an ambroſial or muſky ſcent; the whole plant is covered with hairs, which are glutinous, particularly thoſe of the calyx. All the parts are larger; the ſtem is ſwollen and crooked at the joints. The wings are fewer in the leaves, ovate, ſometimes only ſerrate or jagged, rarely pinnatifid; peduncles thickly ſet with fine white hairs, ending in pellucid globules, with from four to ten flowers, forming a roundiſh head; corolla red or purple; annual. Native of England, France, Switzerland, the Cape of Good Hope, Syria, Barbary, Peru. With us about Batterſea, Streatham, &c. near London, near Briſtol, Stourbridge; in Weſtmoreland and Yorkſhire.

14. Erodium tordylioides, or Algiers crane's-bill: peduncles many-flowered; leaves bipinnatifid, unequally ſerrate, the outmoſt lobes confluent. This ſeems to differ from the preceding in having a perrennial root, and bipinnate leaves; but it is perhaps no more than a variety. Found on rocks near Algiers by Desfontaines.

15. Erodium gruinum, or broad-leaved annual crane's-bill: peduncles many-flowered; leaves ternate, crenate-toothed, the outmoſt pinnatifid-lobed. This is an annual plant with very broad leaves, cut on their ſides regular and crenate. The ſtem is quite ſmooth, whereas in the next ſpecies it is rough with hairs, or ſtrigoſe. Native of Spain, Sicily, Candia, Cyprus, Syria.

16. Erodium ciconium, or long-beaked crane's-bill. This alſo is an annual plant, which has ſeveral proſtrate ſtems near a foot long; flowers pale blue; beaks of the fruit long, but by no means ſo long or large as thoſe of the preceding. Native of the ſouth of Europe, Barbary, Syria, Cyprus, Madeira. Cultivated in the botanic garden at Chelſea in 1724.

β. Geranium botrys, or hairy crane's-bill. In this variety the whole plant is rough with hairs. It is a native of Spain, Portugal, and Italy, on ſandy coaſts.

17. Erodium lacerum, or torn crane's-bill: peduncles many-flowered; leaves doubly-pinnatifid; ſegments very remote, linear, quite entire. Stem grooved, branched, more than a foot high; fruit rufeſcent, with a beak two inches long. Native of Portugal.

18. Erodium diphyllum, or two-leaved crane's-bill: peduncles many-flowered; involucres two-leaved, round-diſh; lower leaves three-lobed, upper pinnatifid laciniate, gaſhed. The involucre is compoſed of two oppoſite, membranaceous, largiſh bractes, that are very conſpicuous, and give it the ſignificant trivial name. Native of Portugal, Gibraltar, Algiers, Tunis, Candia, and Cyprus; annual.

19. Erodium muticum, or beardleſs crane's-bill: peduncles many-flowered; leaves ternatifid, gaſhed, toothed; calyxes awnleſs. Found by Desfontaines in the kingdom of Tunis.

20. Erodium hymenodes, or Barbary erodium: peduncles many-flowered; leaves ternate or ternatifid; ſegments roundiſh, lobed. Found by Desfontaines on rocks in Barbary.

21. Erodium incarnatum, or fleſh-coloured crane's-bill: peduncles few-flowered; leaves three-parted or ternate, trifid, rugged; ſtem ſomewhat ſhrubby. This has the habit of Potentilla, with a ſlender, ſmooth, hard ſtem, inclining to ſhrubbineſs. The leaves are on very long petioles, heart-ſhaped, roundiſh, undivided, ſmall; ſtipules lanceolate, very ſharp; flowers red, fleſh-coloured, or ſcarlet, with a paler diſk. Native of the Cape of Good Hope.

II. Leaves lobed, or undivided. 22. Erodium malacoides, or mallow-leaved crane's-bill: peduncles many-flowered; leaves heart-ſhaped, three-lobed; lobes lobed obtuſe, obſoletely-toothed. This is an annual plant, with the lower leaves heart-ſhaped and three-lobed; branches inclining to the ground, and ſpreading a foot and an half each way. The peduncles are placed on the ſide of theſe, and ſuſtain many bright-red flowers. The fruits have long beaks. Native of the South of Europe, Madeira, Barbary, Syria, the iſlands of the Archipelago and in Peru. The Geranium Chium is a variety, native of the iſland of Chio.

23. Erodium populifolium, or poplar-leaved erodium: peduncles many-flowered; leaves heart-ſhaped, ſublobed, obtuſe-toothed; ſtamens hirſute. This has the habit of the preceding; from which, however, it ſeems to differ in its ſtipulation, and in the hirſuteneſs of the filaments, which are ſmooth in *malacoides* and *chium*. Found in Barbary by Poiret.

24. Erodium nervuloſum, or nerved erodium: peduncles many-flowered; leaves heart-ſhaped, almoſt undivided, toothed, thick, nerved. Native of Sicily.

25. Erodium glaucophyllum, or glaucous crane's-bill: peduncles many-flowered; leaves oblong, obſoletely crenate, glaucous; beaks feathered. This is an annual plant, with leaves very like thoſe of E. malacoides, but ſmooth; ſtem extremely ſimple, very ſhort. Native of Egypt.

26. Erodium guttatum, or ſpotted crane's-bill: peduncles three-flowered; leaves heart-ſhaped, obſoletely lobed, tooth-ſerrate, aſh-coloured, the centre of a different colour. This is very nearly allied to the preceding, but the herb is ſilk and hoary, not naked and glaucous, as in that. The flowers are violet-coloured, with a very dark violet diſk, and are extremely ſweet-ſcented. Found by Shaw and Desfontaines in Barbary.

27. Erodium maritimum, or ſea crane's bill: peduncles three-flowered or thereabouts; leaves heart-ſhaped, gaſhed, crenate, rugged; ſtems depreſſed. Stems branched, lying cloſe to the ground; flowers one to three, pale red, ſmall; beaks of the fruit very ſmall, not exceeding half an inch in length. Native of England and Holland, on the coaſt; Norfolk and Cornwall; alſo on ſandy commons in Worceſterſhire.

28. Erodium chamædryoides, or dwarf crane's-bill: almoſt ſtemleſs; peduncles one-flowered; leaves heart-ſhaped, obtuſe, crenate. Native of Minorca and Corſica. It has been known many years to the nurſery-men by the name G. Reichardi, in compliment to a French gentleman, who firſt diſcovered it in the iſland of Minorca.

Propagation and Culture, ſee GERANIUM.

ERO'DIUS, *ſ.* in entomology, a genus belonging to the order of coleoptera; the generic characters of which are: antennæ moniliform; feelers four, filiform; body roundiſh, gibbous, immarginate; thorax tranſverſe; ſhells cloſely united, longer than the abdomen; jaw horny, bifid; lip horny, emarginate. There are only four ſpecies of this inſect at preſent known; and theſe, from their

ſhape,

ſhape, have been confounded with the coccinella and chryſomela. The thorax is widely emarginate before, for the reception of the head; the ſhells are very gibbous, ending in a kind of point. One ſpecies, the teſtudinarius, inhabits the Cape of Good Hope; two others, the gibbus and planus, are natives of Arabia; and the minutus is found in the Eaſt Indies. The ſhells of this ſpecies are black, glabrous, and cloſely united; with two impreſſed dots on the back of the thorax. See this inſect in the engraving of the plant *Epidendrum*.

EROGA'TION, *ſ.* [*erogatio*, Lat.] The act of giving or beſtowing; diſtribution.

EROPHEE'VO, a town of Ruſſia, in the government of Irkutſch: ſixty miles north of Balaganſkoi.

E'ROS, a ſervant of whom Antony demanded a ſword to kill himſelf. Eros produced the inſtrument, but inſtead of giving it to his maſter, he killed himſelf in his preſence. *Plutarch.*—A ſon of Chronos, or Saturn, and god of love.

ERO'SION, *ſ.* [*eroſio*, Lat.] The act of eating away. The ſtate of being eaten away; canker; corroſion.—As ſea-ſalt is a ſharp ſolid body, in a conſtant diet of ſalt meat, it breaks the veſſels, produceth *eroſions* of the ſolid parts, and all the ſymptoms of the ſea-ſcurvy. *Arbuthnot.*

EROTE'UM, *ſ.* [ſo named by Swartz, perhaps from ερως, Gr. love.] In botany, a genus of the claſs polyandria, order monogynia. The generic characters are—Calyx: perianthium five-leaved; leaflets ovate, concave, incumbent, permanent. Corolla: petals five, ovate-roundiſh, concave, entire, ſpreading. Stamina: filaments numerous (thirty), ſhorter than the petals, erect, filiform, placed on the receptacle; antheræ roundiſh; minute. Piſtillum: germ ovate, pubeſcent, ſuperior; ſtyle erect, generally longer than the ſtamens, awl-ſhaped, trifid at the tip, permanent; ſtigmas obtuſe, ſimple, reflex. Pericarpium: berry roundiſh, juiceleſs, acuminate with the permanent ſtyle, ſmooth, three-celled. Seeds: in threes or fours, oblong, compreſſed a little. It has the inflorescence, flower, and habit, of thea, but the fruit is of a different kind.—*Eſſential Character.* Calyx five-leaved; corolla five-petalled; ſtyle trifid; berry juiceleſs, three-celled, many-ſeeded.

Species. 1. Eroteum thæoides, or thæa eroteum: leaves ovate-lanceolate, ſerrate-toothed; flowers axillary, ſolitary. Native of Jamaica.

2. Eroteum undulatum, or waved eroteum: leaves elliptic-lanceolate, acuminate, ſerrate; flowers crowded, axillary. Native of Jamaica, St. Chriſtopher's, Montſerrat, Guadaloupe, &c.

ERO'TIA, a feſtival in honour of Eros the god of love. It was celebrated by the Theſpians every fifth year with ſports and games, when muſicians and others contended. If any quarrels or ſeditions had ariſen among the people, it was then uſual to offer ſacrifices and prayers to the god, that he would totally remove them.

ERO'TIC, *adj.* [ερωτικος, Gr.] Treating of love. This word is chiefly uſed in ſpeaking of Greek novels, and their authors.

EROTOMA'NIA, *ſ.* [from ερως, love, and μανια, Gr. madneſs.] That melancholy or derangement of the ſenſes which is the effect of love.

ERO'TYLUS, *ſ.* [from ερως, Gr. love.] A ſpecies of fungus reſembling the erotium; a ſtone ſo called becauſe it was formerly uſed in love charms and philtres.

ERPE'NIUS, or ERPEN (Thomas), a learned writer and oriental ſcholar, born at Gorcum in Holland, in 1584. He was ſent to the univerſity of Leyden, when eighteen years of age. After availing himſelf of the helps which the univerſity of Leyden afforded, he travelled for further improvement into England, France, Italy, and Germany. In England he became acquainted with the excellent Bedell, who was a conſiderable proficient in Hebrew, and rabbinical learning. After ſpending four years in foreign countries, he returned to Holland in 1612, where he was choſen profeſſor of the Arabic and other oriental tongues, in the univerſity of Leyden. In this ſituation Erpenius diſcharged the duties of his office with eminent ability and reputation; and ſoon after his appointment he ſet up, at a conſiderable expence, a preſs for the printing of works in oriental literature. He was the author of various works, publiſhed during his life-time, and after his death, which have deſervedly given him a high reputation among oriental ſcholars. The following is a liſt of his valuable publications: 1. *Annotationes ad Lexicon Arabicum Franciſci Raphelengii*, 1613, 4to. 2. *Grammatica Arabica*, 1613, 4to. 3. *Proverbiorum Arabicorum Centuriæ II. Arabicè & Latinè, cum Scholiis Joſephi Scaligeri & Thomæ Erpenii*, 1614, 4to. 4. *Lockmanni Fabulæ & ſelecta quædam Arabum adagia, cum Interpretatione Latina & Notis*, 1615, 8vo. 5. *Novum Teſtamentum Arabicè*, 1615, 4to. 6. *Giarumia grammatica de centum Regentibus, ſive Linguæ Arabiæ particulis, Arabicè & Latinè, cum Notis*, 1617, 4to. 7. *Hiſtoria Joſephi Patriarchæ ex Alcorano, Arabicè, cum Verſione Latina & Notis*, 1617, 4to. 8. *Canones de Literarum EVI apud Arabes Natura & Permutatione*, 1618, 4to. 9. *Rudimenta Linguæ Arabicæ*, 1620, 8vo. 10. *Verſio & Notæ ad Arabicum Paraphraſin in Evangelium Joannis*, 1620, 8vo. 11. *Grammatica Hebræa*, 1621, 8vo. 12. *Orationes tres de Linguarum Hebreæ atque Arabicæ Dignitate*, 1621, 8vo. 13. *Pentateuchus Moſis, Arabicè*, 1622, 4to. 14. *Arcanum punctationis revelatum, &c.* 1624, 4to. 15. *Elmacini Hiſtoriæ Saracenica, &c.* 1625, folio. 16. *Pſalmi Davidis, Syriacè, cum Verſione Latina*, 1625, 4to. 17. *De peregrinatione Gallicæ utiliter inſtituenda Tractatus*, 1631, 12mo. 18. *Precepta. de Lingua Græcorum Communi*, 1662, 8vo.

ER'PES, *ſ.* [from ερπω, Gr. to creep.] The ſhingles, named from their gradually increaſing till they creep as it were round the body.

To ERR, *v. n.* [*erro*, Lat.] To wander; to ramble:

The rains ariſe, and fires their warmth diſpenſe;
And fix'd and *erring* ſtars diſpoſe their influence. *Dryden.*

To miſs the right way; to ſtray.—We have *erred* and ſtrayed like loſt ſheep. *Common Prayer.*—To deviate from any purpoſe:

But *errs* not nature from this gracious end,
From burning ſuns when livid deaths deſcend? *Pope.*

To commit errors; to miſtake.—Do they not *err* that deviſe evil. *Prov.* xiv. 22.

The muſes' friend, unto himſelf ſevere,
With ſilent pity looks on all that *err.* *Waller.*

ER'RA, a town of Portugal, in the province of Eſtremadura, on a river of the ſame name: twenty-two miles ſouth-eaſt of Santarem.

ER'RA, a river which runs into the Latas, twelve miles eaſt of Salvaterra, in the province of Eſtremadura.

ERRABA'RI, a town of Egypt, ten miles north-weſt of Cairo.

ER'RABLE, *adj.* Liable to err; liable to miſtake.

ER'RABLENESS, *ſ.* Liableneſs to error; liableneſs to miſtake.—We may infer from the *errableneſs* of our nature, the reaſonableneſs of compaſſion to the ſeduced. *Decay of Piety.*

ERRAI'NE, a town of Egypt: two miles eaſt of Tahta.

ER'RAND, *ſ.* [ærenð, Sax. *arend*, Dan.] A meſſage; ſomething to be told or done by a meſſenger; a mandate; a commiſſion. It is generally uſed now only in familiar language.—When he came, behold the captains of the hoſt were ſitting, and he ſaid I have an *errand* to thee, O captain. *Kings.*

Nor doubt I, but the ſilver-footed dame,
Tripping from ſea, on ſuch an *errand* came. *Dryden.*

ERRAN'T, *adj.* [*errans*, Lat. *errant*, Fr.] Wandering; roving; rambling. Particularly applied to an order of knights much celebrated in romances, who roved about the world in ſearch of adventures:

Chief of domeſtic knights and *errant*,
Either for chartel or for warrant. *Hudibras.*

Vile; abandoned; completely bad. See ARRANT.

Thy company, if I ſlept not well
A-nights, would make me an *errant* fool. *Ben Jonſon.*

Deviating from a certain courſe:

Knots, by the conflux of meeting ſap,
Infect the ſound pine, and divert his grain,
Furtive and *errant*, from his courſe of growth. *Shakeſpeare.*

ER'RANTRY, *ſ.* An errant ſtate; the condition of a wanderer.—After a ſhort ſpace of *errantry* upon the ſeas, he got ſafe back to Dunkirk. *Addiſon.*—The employment of a knight errant.

ER'RATA, *ſ.* [Lat.] The faults of the printer inſerted in the beginning or end of the book.—If he meet with faults, beſides thoſe that the *errata* take notice of, he will conſider the weakneſs of the author's eyes. *Boyle.*

ERRA'TIC, *adj.* [*erraticus*, Lat.] Wandering; uncertain; keeping no certain order; holding no eſtabliſhed courſe. This term is commonly applied to the planets which are called *erratic* or wandering ſtars, in contradiſtinction to the fixed ſtars:

The earth, and each *erratic* world,
Around the ſun their proper centre whirl'd,
Compoſe but one extended vaſt machine. *Blackmore.*

Irregular; changeable.—They are incommoded with a ſlimy mattery cough, ſtink of breath, and an *erratic* fever. *Harvey.*

ERRA'TICALLY, *adv.* Without rule; without any eſtabliſhed method or order.—They come not forth in generations *erratically*, or different from each other, but in ſpecifical and regular ſhapes. *Brown.*

ERRA'TUM, *ſ.* The ſingular number of ERRATA.

ER'RHINES, *ſ.* [from ῥὶν, Gr. the noſe.] Medicines ſnuffed up the noſe to promote a diſcharge of the mucus.

ER'RIFF, a province of Africa, in the country of Fez.

ERRIP'SIS, *ſ.* [from ἐρείπτω, Gr. to caſt down.] A proſtration or loſs of ſtrength.

ER'ROAD, a town of India, in the country of Coimbetore: thirty-nine miles eaſt-ſouth-eaſt of Damicotta, and forty-eight north-eaſt of Coimbetore.

ER'ROL, a town of the American ſtates, on lake Umbagog, in the north eaſternmoſt ſettled part of Grafton county, New-Hampſhire, incorporated in 1774.

ERROMAN'GO, an iſland in the Southern Pacific Ocean, and one of thoſe called the *New Hebrides*, about twenty-four leagues in circumference. Lat. 18. 47. S. lon. 169. 19. E. Greenwich.

ERRONA'N or TOOTOONA, an iſland in the South Pacific Ocean, and one of the moſt eaſtern of thoſe called the *New Hebrides*, about five leagues in circumference.

ERRO'NEOUS, *adj.* [from *erro*, Lat.] Wandering; unſettled.—This circle, by being placed here, ſtopped much of the *erroneous* light, which otherwiſe would have diſturbed the viſion. *Newton.*

Unblam'd abundance crown'd the royal board,
What time this dame rever'd her prudent lord;
Who now, ſo heav'n decrees, is doom'd to mourn,
Bitter conſtraint! *erroneous* and forlorn. *Pope.*

Irregular; wandering from the right road.—If the veſſels, inſtead of breaking, yield, it ſubjects the perſon to all the inconveniences of *erroneous* circulation; that is, when the blood ſtrays into the veſſels deſtined to carry ſerum or lymph. *Arbuthnot.*—Miſtaking; miſled by error.—Thou art far from deſtroying the innocent with the guilty, and the *erroneous* with the malicious. *King Charles.*—Miſtaken; not conformable to truth; phyſically falſe.—The phænomena of light have been hitherto explained, by ſuppoſing that they ariſe from new modifications of the rays, which is an *erroneous* ſuppoſition. *Newton.*

ERRO'NEOUSLY, *adv.* By miſtake; not rightly.—The minds of men are *erroneouſly* perſuaded, that it is the will of God to have thoſe things done which they fancy. *Hook.*

ERRO'NEOUSNESS, *ſ.* Phyſical falſehood; inconformity to truth.—The phænomena may be explained by his hypotheſis, whereof he demonſtrates the truth, together with the *erroneouſneſs* of ours. *Boyle.*

ER'ROR, *ſ.* [Lat.] Miſtake; involuntary deviation from truth.—*Error* is a miſtake of our judgment giving aſſent to that which is not true. *Locke.*

Oh, hateful *error*, melancholy's child!
Why do'ſt thou ſhew to the apt thoughts of men,
The things that are not? *Shakeſpeare.*

A blunder; an act or aſſertion in which a miſtake is committed:

In religion,
What damned *error*, but ſome ſober brow
Will bleſs it? *Shakeſpeare.*

Roving excurſion; irregular courſe:

What brought you living to the Stygian ſtate?
Driv'n by the winds and *errors* of the ſea,
Or did you Heav'n's ſuperior doom obey? *Dryden.*

[In theology.] Sin.—Blood he offered for himſelf, and for the *errors* of the people. *Heb.* ix. 7.

ER'ROR, in law, ſignifies ſomething wrong in pleading or proceſs; whereupon a writ is brought for remedy thereof, called a writ of error. This writ is a commiſſion to judges of a ſuperior court by which they are authoriſed to examine the record, upon which a judgment was given in an inferior court, and on ſuch examination to affirm or reverſe the ſame, according to law. *Jenk. Rep.* 25. There is alſo a writ of error to reverſe a fine, and which muſt be proſecuted within twenty years by 10 & 11 Wil. III. c. 14. A writ of error to ſome ſuperior court of appeal is the principal method of redreſs for erroneous judgments in the king's courts of record, having power to hold plea of debt or trepaſs above 40s. It lies for ſome ſuppoſed miſtake in the proceedings of ſuch court; for, to amend errors in a baſe court, not of record, a writ of falſe judgment lies. *Finch L.* 484. The writ of error only lies upon matter of law, ariſing on the face of the proceedings; ſo that no evidence is required to ſubſtantiate or ſupport it, there being no method of reverſing an error in the determination of facts, but by an attaint or a new trial, to correct the miſtakes of the former verdict. If a writ of error be brought to reverſe any judgment of an inferior court of record where the damages are leſs than 10l. or if it is brought to reverſe the judgment of any ſuperior court after verdict, he that brings the writ, or that is plaintiff in error, muſt (except in ſome peculiar caſes) find ſubſtantial bail; to prevent delays by frivolous pretences of appeal; and for ſecuring payment of coſts and damages. 3 *Jac.* I. c. 8. 13 *Ch.* II. c. 2. 16 & 17 *Ch.* II. c. 8. 19 *Geo.* III. c. 70.

A writ of error lies from the inferior courts of record in England into the king's bench, and not into the common pleas. *Finch L.* 480. And before 23 *Geo.* III. c. 28, it lay from the king's bench in Ireland to the king's bench in England. It likewiſe may be brought from the common pleas at Weſtminſter to the king's bench, and then from the king's bench the cauſe is removable to the houſe of lords. From proceedings on the law ſide of the exchequer, a writ of error lies into the court of exchequer-chamber, before the lord chancellor, lord treaſurer, and the judges of the courts of king's-bench and common-pleas; and from thence it lies to the houſe of peers. From proceedings in the king's-bench in debt, detinue, covenant, account, caſe, ejectment, or treſpaſs, originally begun there by bill (except where the king is a party), it lies to the exchequer-chamber, before the juſtices of the common-pleas and barons of the exchequer; and from thence alſo to the houſe of lords. 27 *Eliz.* c. 8. But where the proceedings in the king's-bench do not firſt commence therein by bill, but by original writ ſued out of chancery, this takes the caſe out of the general rule laid down by the ſtatute; ſo that the writ of error then lies without any intermediate ſtage of appeal directly to the houſe of lords, the dernier reſort for the ultimate deciſion of every civil action. *Carth.* 180. *Comb.* 295. Each court of appeal in their reſpective ſtages may, upon hearing the

matter of law in which the error is aſſigned, reverſe or affirm the judgment of the inferior courts; but none of them are final ſave only the houſe of peers, to whoſe judicial deciſion all other tribunals muſt therefore ſubmit and conform their own.

In criminal caſes alſo, judgments may be reverſed by writ of error; which lies from all inferior criminal juriſdictions to the court of king's-bench, and from king's-bench to the houſe of peers. It may be brought for notorious miſtakes in the judgment or other parts of the record: as where a man is found guilty of perjury and receives the judgment of felony; or for other leſs palpable errors, ſuch as any irregularity, omiſſion, or want of form, in the proceſs of outlawry or proclamations; the want of a proper addition to the defendant's name, according to the ſtatute; for not properly naming the ſheriff, or other officer of the court, or not duly deſcribing where his county court was held: for laying an offence committed in the time of the late king, to be done againſt the peace of the preſent; and for many other ſimilar cauſes, which (though allowed out of tenderneſs to life and liberty) are not much to the credit or advantage of national juſtice.

Theſe writs of error to reverſe judgments in caſes of miſdemeanors, are not to be allowed of courſe, but on ſufficient probable cauſe ſhewn to the attorney general; and then they are underſtood to be grantable of common right, *et ex debito juſtitiæ*. But writs of error to reverſe attainders in capital caſes are allowed only *ex gratiâ*; and not without expreſs warrant under the king's ſign manual, or at leaſt by the conſent of the attorney general. Thoſe therefore can rarely be brought by the party himſelf, eſpecially where he is attainted for an offence againſt the ſtate; but they may be brought by his heir or executor after his death. But the eaſier and more effectual way, is to reverſe ſuch attainder by act of parliament.

Error in the king's-bench is thus proſecuted: the curſtor of the county makes out the writ of error, from a præcipe or copy of the declaration left with him; which is to be allowed with the clerk of the errors, and a certificate of the allowance of the writ muſt be ſerved on the defendant's attorney in error; alſo the plaintiff's attorney in the action, is to procure an original to warrant his judgment; and warrants of attorney muſt be filed and bail put in, where required, &c. And then the proceedings are by *ſcire facias ad audiendum errores* againſt the plaintiff in the action, wherein judgment was obtained; and the writ of error being received by the ſheriff to whom directed, he is to give notice to the plaintiff in error to ſhew cauſe why execution ſhould not be on the judgment, and make a return to that purpoſe; then a rule is to be given with the clerk of the rules for the plaintiff in error to aſſign his errors by ſuch a day, which if he ſhall not do before the rule is out, the plaintiff in the original action may take out execution againſt him.

If you would bring a writ of error in parliament to reverſe a judgment in the king's-bench, there muſt be a petition to the king for his warrant, which petition has the allowance of the attorney-general, and then the king writes on the top of it *Fiat juſtitia*; whereupon a writ of error is made out by the clerk of the errors. And then the lord chief juſtice of the king's-bench carries the record, and a tranſcript thereof, up to the houſe of lords in full parliament, and after they are examined there, leaves the tranſcript with the lords, but brings back the record: and this being done, the attorney for the defendant in error gets ſome lord to move that the plaintiff in error may aſſign his errors; but if for the plaintiff, motion is to be made, that upon his aſſigning errors, the defendant may appear and make his defence, and counſel be heard on both ſides: then, after the judgment is either affirmed or reverſed, the clerk of the parliament remands the tranſcript of the record into the king's-bench with the affirmation or reverſal thereof, to be entered upon the record of the ſaid court, which court, if affirmed, awards execution, &c.

ERSE, *adj.* Old Scotch.—Have you ſeen the *Erſe* fragments, ſince they were printed? *Gray's Letters.*

ERSE, a river of Germany, in the circle of Lower Saxony, which runs into the Fuhſe, eight miles ſouth of Zelle.

ER'SILTON, or ERLSTON, a town of Scotland, in the county of Berwick: ſeven miles ſouth-ſouth-eaſt of Lauder, and twenty-eight weſt of Berwick.

ERST, *adv.* [*erſt*, Germ. æpꝛta, Sax.] Firſt:

Sir knight, if knight thou be,
Abandon this foreſtalled place at *erſt*,
For fear of further harm, I counſel thee. *Spenſer.*

At firſt; in the beginning:

Fame that her high worth to raiſe,
Seem'd *erſt* ſo laviſh and profuſe,
We may juſtly now accuſe
Of detraction from her praiſe. *Milton.*

Once; when time was:

As ſignal now in low dejected ſtate
As *erſt* in higheſt. *Samſon Agoniſtes.*

Formerly; long ago:

The future few or more, howe'er they be,
Were deſtin'd *erſt*, nor can by fate's decree
Be now cut off. *Prior.*

Before; till then; till now.—The Rhodians, who *erſt* thought themſelves at great quiet, were now overtaken with a ſudden miſchief. *Knolles.*

Opener mine eyes,
Dim *erſt*; dilated ſpirits, ampler heart. *Milton.*

ER'STEIN, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diſtrict of Benfelden: three leagues ſouth of Straſburg.

ER'TO DEL FERRO, a town of Italy, in the kingdom of Naples, and province of Calabria Citra: ten miles weſt of Umbriatico.

ERUBES'CENCE, or ERUBESCENCY, *ſ.* [*erubeſcentia*, Lat.] The act of growing red; redneſs.

ERUBES'CENT, *adj.* [*erubeſcens*, Lat.] Reddiſh; ſomewhat red; inclining to redneſs.

ERU'CA, *ſ.* [from *erugo*, Lat. to make ſmooth.] A worm or caterpillar; ſo called becauſe in moving it extends and ſmooths the wrinkles in the ſkin. See ENTOMOLOGY, in this volume.

ERU'CA, *ſ.* in botany. See ARABIS, BRASSICA, BUNIAS, CHEIRANTHUS, ERYSIMUM, SINAPIS, and SISYMBRIUM.

ERUCA'GO, *ſ.* in botany. See BUNIAS and RESEDA.

ERUCAS'TRUM, *ſ.* in botany. See BRASSICA.

To ERU'CT, or ERUCTATE, *v. a.* [*eructo*, Lat.] To belch; to break wind from the ſtomach.

ERUCTA'TION, *ſ.* The act of belching.—Belch; the matter vented from the ſtomach.—The ſigns of the functions of the ſtomach being depraved, are *eructations*, either with the taſte of the aliment, acid, inodorous, or fetid. *Arbuthnot.*—Any ſudden burſt of wind or matter.—Thermæ, are hot ſprings, or fiery *eructations*; ſuch as burſt forth of the earth during earthquakes. *Woodward.*

E'RUDITE, *adj.* [*eruditus*, Lat.] Learned. It often conveys a ſneer.—Your Latin lecture is as good Latin as the *erudite* Germans ſpeak or write. *Cheſterfield.*

E'RUDITELY, *adj.* Learnedly. *Scott.*

ERUDI'TION, *ſ.* [*eruditio*, Lat.] Learning; knowledge obtained by ſtudy and inſtruction.—Some gentlemen, abounding in their univerſity *erudition*, fill their ſermons with philoſophical terms. *Swift.*

ERVEDEI'RA, a town of Portugal, in the province of Eſtremadura: twelve miles north-north-weſt of Leiria.

ERUGA'TION, *ſ.* [*e*, from, and *ruga*, Lat. wrinkles.] The act of clearing any thing from wrinkles. *Scott.*

ERU'GINOUS, *adj.* [*æruginoſus*, Lat.] Partaking of the ſubſtance and nature of copper.—Copperas is a rough and acrimonious kind of ſalt, drawn out of ferreous and

eruginous

eruginous earths, partaking chiefly of iron and copper; the blue of copper, the green of iron. *Browne.*

ER'VINE, a townſhip of the American States, in Ontario county.

ERUNCA'TION, *ſ.* A weeding or pulling up of weeds.

ERUP'TION, *ſ.* [*eruptio*, Lat.] The act of breaking or burſting forth from any confinement.—Finding themſelves pent in by the exterior earth, they preſſed with violence againſt that arch, to make it yield and give way to their dilatation and *eruption*. *Burnet.*—Burſt; emiſſion; ſomething forcing itſelf out ſuddenly.—In part of Media there are *eruptions* of flames out of plains. *Bacon.*—Sudden excurſion of an hoſtile kind:

Thither, if but to pry, ſhall be perhaps
Our firſt *eruption*, thither or elſewhere;
For this infernal pit ſhall never hold
Celeſtial ſpirits in bondage. *Milton.*

Violent exclamation.—To his ſecretary he would, in the abſence of all other ears and eyes, break out into bitter and paſſionate *eruptions*. *Wotton.*—Efflorence; puſtules.—Unripe fruits are apt to occaſion foul *eruptions* on the ſkin. *Arbuthnot.*

ERUP'TIVE, *adj.* [*eruptius*, Lat.] Burſting forth:

'Tis liſtening fear, and dumb amazement all,
When to the ſtartled eye the ſudden glance
Appears far ſouth *eruptive* through the cloud. *Thomſon.*

ERUPTU'RIENT, *adj.* Apt to break forth; ready to break forth. *Cole.*

ER'VUM, *ſ.* [of Pliny; from the Greek ορόβος, changing *β* into *υ*, as from *βια*, *vis*, from *βιω*, *vivo*, from *βοσκω*, *veſcor.*] The TARE, or LENTIL; in botany, a genus of the claſs diadelphia, order decandria, natural order of papilionaceæ or leguminoſæ. The generic characters are—Calyx: five-parted, length of the corolla; diviſions linear, acuminate, nearly equal. Corolla: papilionaceous; ſtandard flat, ſlightly reflex, roundiſh, larger; wings obtuſe, ſhorter by half than the ſtandard; keel ſhorter than the wings, acuminate. Stamina: filaments diadelphous (ſimple and nine-cleft), riſing; antheræ ſimple. Piſtillum: germ oblong; ſtyle ſimple, riſing; ſtigma obtuſe, beardleſs. Pericarpium: legume oblong, obtuſe, columnar, knotty with the protuberant ſeeds. Seeds: four. This genus differs from Vicia in the ſtigma alone.—*Eſſential Character.* Calyx five-parted, the length of the corolla.

Species. 1. Ervum lens, or flat-ſeeded tare or common lentil: about two flowers on a peduncle, ſeeds compreſſed, convex. The lentil is an annual plant, and the leaſt of the pulſe kind which is cultivated. It riſes with weak ſtalks a foot and a half high, having pinnate leaves at each joint, compoſed of ſeveral pairs of narrow leaflets, terminated by a tendril, which ſupports it by faſtening about ſome other plant. The flowers come out on ſhort peduncles from the ſides of the branches; they are ſmall, of a pale purple colour, and three or four together. Legumes ſhort and flat, containing two or three flat, round, ſeeds, a little convex in the middle. The flowers appear in May, and the ſeeds ripen in July. Grows wild in the corn-fields of France and Germany, the paſtures of Carniola, and the vineyards of the Valais. It is cultivated either as fodder for cattle, or for the ſeeds, which are uſed in ſoups. Theſe are commonly eaten by the poorer ſort in ſome iſlands of the Archipelago, and other warm countries. The contempt, however, in which they are held is apparent from the proverbial expreſſions, *Dives factus jam deſiit gaudere lente*; and *mira de lente*. The cultivation of this pulſe does not ſeem to have been of very long ſtanding in England: for Gerarde ſays, "theſe pulſes (great and little lentils) do grow in my garden (1596); and it is reported unto me by thoſe of good credit, that about Watford in Middleſex (Hertfordſhire), and other places of England, the huſbandmen do ſow them for their cattle, even as others do tares."

2. Ervum tetraſpermum, or ſmooth tare: about two flowers on a peduncle; ſeeds globular, four in a legume. Root annual. Stems in open places ſlender, weak, and much branched; but among corn ſupporting themſelves by tendrils to a foot or more in height; two-edged and inclining to four-cornered. Legumes perfectly ſmooth, inclining to cylindric, and containing four ſeeds, nearly globular, browniſh mottled with black. According to Scopoli, there are ſometimes five ſeeds in a legume; and Mr. Woodward remarked a variety near Cambridge, in which the legumes contain, five, ſix, or ſeven, ſeeds, very rarely four. The ſtem was low and extremely branched. Theſe differences could not proceed from luxuriance of ſoil, as the ſpot where it grew was remarkably dry gravel. This ſpecies is found in moſt corn-fields, clinging to the corn, and if the ſeaſon favours its growth, ſometimes quite overcoming it.

3. Ervum hirſutum, or hairy tare: peduncles many-flowered; ſeeds globular, two in a legume. Annual. Stems weak, much branched, climbing, quadrangular, ſtreaked, from one to two feet high. Eaſily diſtinguiſhed from the foregoing; the leaves not being pointed as in that, but truncate; the ſtipules divided into many more ſegments; the flowers, and conſequently the legumes, growing in a kind of cluſter. It is deſtructive to corn, being ſtronger and more prolific. In wet ſeaſons whole crops are overpowered by this plant. Yet this and the preceding may be eaſily deſtroyed, if they are cut up when they begin to flower.

4. Ervum ſolonienſe, or ſpring tare: about two flowers on a peduncle awned, petioles acuminate, leaflets obtuſe. Flower ſmall, reddiſh. Legumes ſlender, an inch in length, with three or four minute hexaedral ſeeds in each. It is diſtinguiſhed by its earlineſs, the tenuity of its parts, and the ſhape of its ſeeds. It appears at the cloſe of winter, in neglected paſtures, in France. Linnæus thinks that it is allied to Lathyrus angulatus. Cultivated in Chelſea garden in 1739; it flowers in April and May.

5. Ervum monanthos, or one-flowered tare or lentil: peduncles one-flowered. Larger than lentil, climbing by means of bifid or trifid tendrils. It is annual; and, according to Linnæus, the leaflets convolute. Native of Ruſſia, and the county of Nice. Near Herborn in Germany, among lentils. It flowers from May to July.

6. Ervum ervilia, or officinal tare: germs naked and plaited, leaves unequally pinnate. This is an annual plant, riſing with angular weak ſtalks, having at each joint one pinnate leaf, compoſed of fourteen or fifteen pair of leaflets, like thoſe of the vetch, but narrower. The flowers come out, in June, from the ſides of the ſtalk, on peduncles an inch long, each ſuſtaining two pale-coloured flowers, which are ſucceeded by ſhort pods a little compreſſed, each containing three or four ſeeds. Native of France, Italy, and the Levant.

Propagation and Culture. The ſeeds of lentils are commonly ſown in March, where the land is dry, but in moiſt ground April is the beſt time. The uſual quantity of ſeed allowed to an acre is from a buſhel and a half to two buſhels. If theſe are ſown in drills in the ſame manner as peaſe, they will ſucceed better than when they are ſown broad caſt: the drills ſhould be a foot and a half aſunder, to allow room for the hoe to clean the ground between them; for if weeds be permitted to grow, they will ſoon ſtarve the lentils. See SOPHORA.

ER'VY, a town of France, and principal place of a diſtrict, in the department of the Aube: ſeventeen miles ſouth of Troyes, and twelve north of Tonnerre.

ER'WASH, a river of England, which riſes in the county of Nottingham, and almoſt in its whole courſe ſeparates that county from Derbyſhire, and falls into the Trent, four miles ſouth-weſt of Nottingham.

ER'WITE, a town of Germany, in the circle of the Lower Rhine, and duchy of Weſtphalia: five miles ſouth of Lippſtadt.

GENERAL

GENERAL INDEX.

EGYPT.

ABDALLAH, entrusted with the command in Africa, besieges Tripoli, 316; his success, 317.
Abdalrachman caliph of the west, 321.
Abercrombie, sir Ralph, lands at Aboukir, 336; gains the battle of Alexandria, but receives a mortal wound, 337; his death, 338.
Aboukir bay and lake, 363; ruins, 364.
Abydus, 358.
Achmin, ruins of, 359.
Acoris, king of Egypt, 297.
Acre besieged by the crusaders, 323; taken, 324; the Christians destroyed, 327; attacked by Bonaparte and defended by sir Sidney Smith, 333.
Actisanes, king of Egypt and Ethiopia, 293.
Aded, the last caliph of Egypt, 320.
Africa, its conquest projected by Othman, 316; successes and reverses of Akbah and Hassan, 317; ruled by the caliphs of the west, 318.
Akbah's expedition into Africa, 317.
Alexander Jannæus, king of the Jews, 306.
Alexandria, 290; the library burnt, 309; how treated by Diocletian, 314; taken by Amrou; taken and plundered by Bonaparte, 329; attacked by the English and Turks, 335; battle of, 336; siege of by Gen. Hutchinson, 341; taken, 342; account of the old city, 364; the pool, harbour, Pompey's pillar, and Cleopatra's needle, 365.
Ali Bey the Great, 328.
Amasis, king of Egypt, 295.
Amer, caliph of Egypt, 319.
Ammosis, 293.
Amrou invades Egypt, 314; his narrow escape, 315; takes Alexandria, ibid; his administration, 316.
Amyrtæus, king of Egypt, 297.
Antinoë and Besa, ruins of, 359.
Antony with Cleopatra at Tarsus, 310; at Alexandria, 311; his war with Octavius, 312; defeated at Actium, and betrayed by Cleopatra, ibid. kills himself, 313.
Apollinopolis Magna, 353; Parva, 356.
Aphroditopolis, 358.
Apries, or Pharaoh Hophra, 295.
Araba, valley of, 346.
Arabia, a province of Lower Egypt so called, 363.
Arabs, modern, 380.
Archelaus marries Berenice queen of Egypt, 307; defeated and killed, 308.
Aristomenes, a faithful minister, put to death, 302.
Arsinoë, daughter of Ptolemy Soter, 299.
Asfun, a village, 353.
Assuan, or Syene, 330, 353, 355.
Asychis, king of Egypt, 294.
Aziz, caliph of Egypt, 318; another Aziz, sultan of Egypt, 325.
Bagdad, the seat of the caliphs, 318.
Barabras, a peculiar people, 380.
Barkuh, first sultan of the Borgite mamalukes, 327.
Bedouin Arabs, 380, 381.
Bees, curious particulars concerning, 387.
Beliard, Gen. defeats Osman Bey at Benhute, 330; takes Cosir, 331.
Beneadi, massacre there, 343.
Benesech, the ancient Oxyrinchus, 360.
Berenice, made queen of Egypt in the absence of her father, 307; put to death by him, 308.
Beys of Egypt, formerly mamalukes, 328; seventeen of them murdered, ibid. more of them murdered, 325.
Bibars, sultan of Egypt and Syria, 326.
Blindness frequent in Egypt, 387.
Bocchoris, king of Egypt, 294.
Bonaparte lands at Alexandria, 329; which he takes, ibid. and Rosetta, ibid. gains the battle of the pyramids, ibid. enters Cairo, ibid. takes and plunders Jaffa, murders the garrison, and poisons his own sick, 331, 344; returns to Cairo, to settle a government for Lower Egypt, 331; his civil institutions, 332; quells an insurrection at Cairo, ibid. besieges Acre, 333; assists at the battle of mount Tabor, ibid. defeated before Acre, 334; returns to Cairo, 335; gains a great victory over the Turks near Alexandria, and then embarks for France, ibid. reflections on his expedition to Egypt, 343.
Boundaries, extent, and divisions, of Egypt, 289.
Bubastus, a province of Lower Egypt, 363.
Burshai, sultan of Egypt, 327.
Busiris, king of Egypt, 292.
Cæsar, Julius, his reception in Egypt, 309; settles Cleopatra on the throne, 310; reforms the calendar, 374.
Cairo, or the Town of Victory, 314; taken by Bonaparte, 329; re-taken by Gen. Hutchinson, 341; description of it from Denon, 362.
Cairoan, a city in Africa, 317; dreadful battle near that place, 318.
Caliphs of Egypt, 314-320; luxury and effeminacy occasion their fall, 321.
Cambyses king of Persia, subdues Egypt, 296.
Camels and other cattle of Egypt, 387.
Canopus, ruins of, 364.
Cephrones, king of Egypt, 293, 371.
Chemmis, or Panopolis, 359.
Chenubis, a city of Egypt, 356.
Cheops, king of Egypt, 293; his monument, 361; impiety, 371.
Cleomenes, king of Sparta, 301.
Cleopatra, widow of Ptolemy Philometor, marries his brother Physcon, 304; raised to the throne, 305; expelled, ibid. raises Alexander to the throne, 306; her death, ibid.
Cleopatra II. 308; expelled 309; restored by Cæsar, ibid. her connection with Mark Antony, 310; her behaviour at Jerusalem, 311; her treachery 312; endeavours to gain Octavius to her purpose, 313; her death and character, 314.
Cleopatra's Needle at Alexandria, 365, 378.
Cneph, an Egyptian deity, 354.
Conrad of Montferrat, defends Tyre against Saladin, 323; murdered there, 324.
Contra-Latopolis, 353.
Coptos, or Keft, 356, 357.
Curiosities, Egyptian, taken from the French by the English, 384.
Damietta repeatedly taken during the crusades, 325; described, 363.
Davalta, a village, 346.
Davoust, Gen. takes and plunders Beneadi, 336.
Delta, formation of that island, 366.
Dendera, or Tentyra, 357.
Denon, the only historian of Upper Egypt, 346; his account of the Egyptian mummies and burial-places, 351; of the festival on Mahomet's birth-day, 381.
Desaix, general, commands the French in Upper Egypt, 329; engages Mourad Bey, ibid. worsts him a second time, and takes Syene, 330; on his return towards Cairo, gains the battle of Birambar, 331; finishes the war with success in Upper Egypt, 336; the extent of his march, 355.
Djezzar, pacha of Egypt, 332; assisted in the defence of Acre by sir S. Smith, &c. 333.
Dio the philosopher murdered, 308.
Diocletian, his severity in Egypt, 314.
Diospolis Parva, 358.
Doyle, brigadier-general, takes a convoy belonging to the French, 339.
Duodecemvirate in Egypt, 294; dissolved by Psammetichus, 295.
Edko, a lake recently formed, 363.
Edward I. of England, his exploits in Egypt, 326.
Egypt, ancient history of, 289-298; from Ptolemy Soter, till reduced to a Roman province, 289-314; governed by caliphs, 314-321; governed by sultans, 321-325; the Mamaluke sultans, 325-327; becomes subject to the Ottoman empire, 327; and governed by a pacha, 328; invaded by the French, 329; delivered by the English, 332; curiosities and antiquities, 346; ignorance of the present race of Egyptians, 357; conjectures as to the first inhabitants, 369; religion, 370; government and language, 371; hieroglyphics, 372, 376; antiquity as a nation, 373; knowledge of the sciences, ibid. measure of time, 374; the arts, ibid. buildings, 375, 383; sculpture, 376; pyramids, obelisks, and sphinxes, 377; present inhabitants, 378; religious festivals, 381; females, 382; manners, and present government, 383; language, money, climate, &c. 384; soil and produce, 386; cattle, fruit, and diseases, 387; natural productions, 388.
El-Hanka, battle of, 340.
Elephantina, island of, 353.
Embalming, how performed, 352, of the ibis, 370.
Esneh, in Upper Egypt, 352; zodiac found there by Desaix, 374.
Etfu, or the city of Apollo, 353.
Ezzed-din Moaz, the first Mamaluke sultan, 326.
Franks, to whom this name was applied, 322; driven out of Syria, 323; and Egypt, 326.
Fry's Egyptian alphabets, 373.
Gantheaume, part of his squadron taken by the English, 340; and afterwards the remainder, 341.
Gebel Silsilis, quarries of, 355.

Girge, the capital of Upper Egypt, 358.
Gizeh, where Memphis formerly ſtood, 362.
Gnephactus king of Egypt, 294.
Greeks driven from Upper Egypt, 315; their preſent ſtate in Egypt, 380.
Guedime, a village near Thebes, 348.
Hafed caliph of Egypt, 319.
Haken caliph of Egypt; a remarkable inſurrection in his reign, 319.
Heliopolis, the Turks defeated there by the French, 335; a province of Lower Egypt, 363.
Heraclius, the Roman emperor; Egypt ſubdued by the Saracens under his reign, 315; his death, 316.
Hermontes and its temple, 348; its crocodiles, 356.
Hermopolis Magna, 359.
Hieraconpolis, ruins of, 353.
Hieroglyphics, an enquiry into their nature, 372, 376.
Hutchinſon, major-general, ſucceeds ſir Ralph Abercrombie in Egypt, 338; takes Roſetta, ibid. takes Rahmanieh and a convoy of proviſions, &c. 339; his interview with the grand-vizier, 340; takes Cairo, 341; and Alexandria, which puts an end to the war, 342; reſtores the government of Egypt, 345.
Jaffa taken by Bonaparte, and the garriſon murdered, 331, 334.
Ibis, the ſacred bird, why embalmed, 370.
Ibrahim Bey, 328; attacks the French near Cairo, 335; now the ſecond perſon in the government of Egypt, 383.
Jeruſalem taken from the cruſaders, by Afdal for the caliph of Egypt, 319; reign of the Chriſtians deſtroyed by Saladin, 322; ceded to the Chriſtians, but ſoon loſt again, 325.
Jews, how treated by Ptolomy Philopator, 301; their deliverance, 302; build a temple in Egypt, 304; again perſecuted, 305; preſent ſtate, 380.
Inarus king of Lybia, made king of Egypt, 296; his death, 297.
Invincible ſtandard taken at the battle of Alexandria, 337.
Joſeph farms the taxes paid by the Jews to Egypt, 300.
Joſephus, his erroneous account of the kings of Egypt, 290.
Iſis, the Egyptian female deity, 370, 372.
Kalil, ſultan of Egypt, 326; drives the Chriſtians from Acre, 327.
Kamel ſultan of Egypt, 325.
Kamſin, or deſtroying wind, 384.
Karnak, a village in Upper Egypt, 348.
Keneh, in Upper Egypt, 357.
Kittah, a curious ſpring, 358.
Kleber ſucceeds to the command of the French army in Egypt on Bonaparte's deſertion, 335; makes a treaty, which the Engliſh break, ibid. gains the battle of the Pyramids, 335; murdered at Cairo, 336.
Kurnu, a village near Thebes, 349.
Labyrinth near Arſinoë, 361.
Lanuſſe, French general, killed at the battle of Alexandria, 337.
Latopolis, or Eſneh, 352.
Louis IX. of France, at the head of the 6th cruſade, 325; taken priſoner, and ranſomed, 326; undertakes the 7th cruſade, ibid. his death, ibid.
Lower Egypt, 290; its ſufferings during Bonaparte's expedition, 343; not ſo rich in curioſities as Upper Egypt, 346; divided into three provinces, 363.
Luſignan king of Jeruſalem, defeated and taken priſoner, 322; releaſed, and undertakes the ſiege of Acre, 323.
Luxor, a village near Thebes, 347, 373.
Lycopolis, or City of Wolves, 289, 359.
Magas king of Lybia and Cyrene, rebels againſt Ptolemy Philadelphus, 299.
Mahadi, his extravagance, 320.
Mahadie or Aboukir lake, 363.
Malek Salah, ſultan of Egypt, 325.
Mamalukes firſt gain power in Egypt, 326; Circaſſian or Borgite mamalukes, 327; the heads of them now called beys, 328; ſtruggle to regain their power, ibid. their preſent ſtate, arms, &c. 379.
Manuſcript, a very curious one found by Denon, 349, 372.
Mareotis, lake, 364.
Medinet-abu, near Thebes, 349.
Memnomium and its ſtatues, 350.
Memphis, 290, 292, 314, 360.
Mendes king of Egypt, 293.
Menes the firſt king of Egypt, 291.
Menou ſucceeds to the command of the French army in Egypt on the murder of Kleber, 336; joins the reſt of the forces at Alexandria, ibid. defeated, 337.
Middle Egypt, 290.
Mirage, an optical illuſion, 386.
Mœris, a famous lake, 362.
Moaz, of the African dynaſty of the Fatimites, reduces Egypt, 318.
Mohammed Bey Elfi, 328.
Moktador, caliph of Egypt, 321.
Monſtanzor caliph of Egypt, 319; a dreadful famine in his reign, ibid.
Morocco founded by Yuſſuf, of the African dynaſty of the Marabuts, 320.
Moſtali caliph of Egypt, 319.
Mourad Bey, 328; defeated by Bonaparte near Gizeh, 329; and by Deſaix near Sedinon, ibid. retreats, 330; totally reduced by Deſaix, 336; his death and character, 338; his palace at Gizeh, 362.
Muſtapha Pacha defeated by Bonaparte, 335.
Mycerinus king of Egypt, 293.
Nagadi and its ruin, 358.
Natron lakes, 386.
Nebuchadnezzar's victories in Egypt, 295.
Nechus, or Necho, king of Egypt, 295.
Necropolis, the City of the Dead, 350.
Nectanebis king of Egypt, 297; fate of Nectanebis II. 298.
Nelſon, admiral, deſtroys the French fleet in Aboukir-bay, 331.
Nephereus king of Egypt, 297.
Nepherotes, the laſt of the Mendeſian race, 297.
Nicotris, or Nicaule, or Nitocris, 291, 292.
Nile, river, firſt called Egyptus, 293, 367, 385; battle of the, 332.
Nilometer, 353, 354, 367.
Nilus king of Egypt, 293.
Oaſes, iſlands, 289, 386.
Octavius (Cæſar), his war with Antony and Cleopatra, 312; refuſes Antony's challenge, and withſtands Cleopatra's charms, 313; reduces Egypt to a Roman province, 314.
Omar, caliph, undertakes the conqueſt of Egypt, 314; his clemency to Alexandria, 315; but orders the library to be deſtroyed, 316.
Ombos, or Com-Ombos, 355.
Ommiades, 320; the extent of their empire, 321.
Oſymandias and his monument, 292, 350.
Oſyris, the Egyptian deity, 370, 372.
Oxyrinchus, 360.
Pachas appointed governors of Egypt, 328; their power declines, ibid.
Panoplis, or Achmin, 359.
Paris and Helen, true hiſtory of, 293.
Pauſiris king of Egypt, 297.
Peluſium, the key of Egypt, 294, 363.
Perſians ſubdue Egypt, 296; which frequently revolts, 297; completely ſubjected, 298.
Phaniſa, or Arabia, 363.
Pharaoh, the common but not excluſive name of the kings of Egypt, 290; the ten Pharaohs mentioned in Scripture, 291.
Pharos, a famous tower, 298, 365.
Pheron, or Seſoſtris II. 293.
Phellippeaux, a French officer, 333.
Philoë, in Upper Egypt, 343, 354.
Plague, cauſes of, 387, 388.
Pompey, murdered in Egypt, 309; his (ſuppoſed) pillar at Alexandria, 365, 378.
Proteus, or Cetes, king of Egypt, 293.
Pſammenitus king of Egypt, 296.
Pſammetichus, 294; becomes king of Egypt, 295, 297.
Pſammis king of Egypt, 295.
Ptolemais, 318.
Ptolemy Alexander, king of Egypt, 306; the Second, 307.
Ptolemy Auletes, 307; his infamous behaviour, and death, 308.
Ptolemy ſon of Auletes, conſents to the murder of Pompey, 309; drowned, 310.
Ptolemy Epiphanes, king of Egypt at five years of age, 302; puts his kingdom under the protection of the Romans, ibid. poiſoned, 303.
Ptolemy Euergetes king of Egypt, 300; his death, 301.
Ptolemy Lagus, or Soter, the firſt king of Egypt after the Perſians were expelled, 298.
Ptolemy Lathurus king of Egypt, 305; expelled, but returns, 306; his exploits againſt the Jews, ibid. his death, 307.
Ptolemy Philadelphus king of Egypt, 298; ſends ambaſſadors to Rome, 299; his attention to commerce, ibid. his death and character, 300.
Ptolemy Philometor king of Egypt, 303; his death and character, 304.
Ptolemy Philopater king of Egypt, 301; his death and character, 302.
Ptolemy Phyſcon, joint king with Philometer, 303; his conduct before and after his brother's death, 304; dies, 305.
Pyramids, battle of, 329; a deſcription of them, 360, 361, 377.
Rahmanieh taken by Gen. Hutchinſon, 339.
Rhampſinitus king of Egypt, 293.
Richard I. king of England joins the cruſade, 323; takes Acre, Cæſarea, and Jaffa, 324; makes a truce with Saladin, ibid. returns home to die, 325.
Roize, French general, killed, 337.
Roſetta taken by Bonaparte, 329; re-taken by Gen. Hutchinſon, 338; when built, 363.
Sabhaco, a blind king, 294.
Saccarah, pyramids of, 360.
Saladin firſt diſtinguiſhes himſelf in Egypt, 320; his parentage, 321; ſultan of Egypt, 322; takes Tiberias and Jeruſalem, ibid. his clemency, 323; repulſed before Tyre, ibid. his death and character, 325.
Selim II. emperor of the Turks, ſubdues all Syria and Egypt, 327.
Selim III. is joined by Great Britain for the purpoſe of driving the French out of Egypt, 322.
Sennacherib's expedition againſt the Jews, 294.
Seſoſtris king of Egypt, 292; his victories, and death, 293.
Sethon, king and prieſt, 291, 294.
Shepherd-kings, 369, 370.
Siut, formerly Licopolis, 359.
Smith, ſir Sidney, his early hiſtory, 332; defends Acre againſt Bonaparte, 333.

Sofinis, a village in Upper Egypt, 353.
Solyman the Legiſlator, emperor of the Turks, ſettles the government of Egypt by a pacha, 328
Sphinxes and obeliſks, 377.
Sultans govern Egypt, 321-327.
Syene in Upper Egypt taken by the French, 330; taken and retaken, 331; its ruins, 353.
Tachos, king of Egypt, 297.
Tentyra, or Berbeh, 357; the zodiac and planiſphere, 357, 358; the temple, 357, 375.
Thebes and its hundred gates, 290, 346, 347; its temple, 348.
Timaus, Egypt ſubdued by marauders in his time, 292.
Toman Bey, the laſt of the Egyptian ſultans, 327.
Touron Shah, ſultan of Egypt, 325; takes the king of France priſoner, 326; murdered by the Mamalukes, ibid.
Typhon and Iſis, a curious tradition of, 367.
Uchoreus, places the ſeat of government at Memphis, 292.
Upper Egypt, the war ſuſtained there by Deſaix againſt Mourad Bey, 329; Mourad reduced, and honourably treated, 336; blood ſpilt there, 343; antiquities and curioſities, 346.
Zobeir, an active general of the Saracens, 316; his extraordinary modeſty, 317.
Zodiac and planiſphere at Tentyra, 357, 358, 374; at Eſneh, 374.

ELECTRICITY.

AIR always electrified, 431; a non-conductor, 432.
Amber, the firſt known electrical ſubſtance, 407.
Animal electricity, or galvaniſm, principles of, 433; experiments, of Volta, Carliſle, Nicholſon, 434, 435; proved identical with common electricity, 437, 438; experiments of M. Bichat, 438, 439; ſimple combinations, 442; decompoſes water, 444; and other fluids, 445; medical effects, ibid. in palſies, deafneſs, &c. 446; Wilkinſon's practice, 447; experiments on dead bodies, 448.
Animal magnetiſm, 434.
Apparatus, electrical, 410; galvanic, 434.
Battery, electrical, 412; deſcribed, 413; galvanic, 435; combination of, 443; to regulate the ſhock from, 444.
Beccaria's experiments in electricity, 408.
Bells, electrical, 413.
Boyle's diſcoveries in electricity, 407.
Canton's experiments with the Leyden phial, 411; his electrometer, 414
Cavallo's experiments with the Leyden phial, 413; his electrometer, 414; experiments on the air, 431.
Cavendiſh, Mr. his mathematical demonſtrations of electricity, 409; his explanation the action of points, 428.
Charcoal a good conductor of electricity and galvaniſm, 442; the beſt medium for the deflagration of metals, 445.
Condenſor, invented by Volta, 421; improved by Cavallo, 422
Conductor, or prime conductor of an electrical machine, 410, 425.
Conductors diſtinguiſhed from electrics, 407, 408, 425; liſt of conductors and non-conductors, of electricity, 426; of galvaniſm, 440; conductors for lightning, 432.
Coulomb's electrometer, 418.
Cruikſhank's improvement on the voltaic pile, 443.
Cuthbertſon's large electrical machine, 410; his electrometer, 414.
Deafneſs cured by galvaniſm, 446, 447.
Deſaguliers, Dr. his diſcoveries in electricity, 408; his thread of trial, or electrometer, 414
Diſcharging-rod, 412.
Du Faye, 407; diſcovers the vitreous and reſinous electricities, 408.
Electric ſubſtances, ſucceſſively diſcovered by Thales and Theopraſtus, Gilbert, Boyle, &c. 407; diſtinguiſhed from non-electrics or conductors, 407, 408; two electric fluids, 408, 425; Mr. Ruſſell's doctrine, 423; M. du Faye's and Franklin's, 425; electric fluid the ſame with lightning, 431; electrical fiſhes, 433.
Electricity, its firſt diſcovery, and ſucceſſive improvement by Dr. Gilbert, Mr. Boyle, Otto Guericke, Dr. Wall, Sir I. Newton, Hawkeſbee, Grey, and Du Faye, 407; Deſaguliers, Ludolph, Watſon, Franklin, Canton, Beccaria, and Dr. Prieſtley, 408; the true theory, 409; medical and mathematical, ibid. ſyſtematical ſtatement of its phenomena, 425-434; analogy between it and magnetiſm, 434; identical with galvaniſm, 434.
Electrometers, ſeveral kinds, 414-419.
Electrophorus, invented by Volta, 417.
Franklin, Dr. diſcovers the identity between electricity and lightning, 408; his explanation of the phenomena of the Leyden phial, and conſtruction of a battery, 412; his electrical kite, 413; his poſitive and negative, or plus and minus, electricity, 423, 427.
Frogs, much uſed in galvanic experiments, 433; how to prepare, 440.
Galvaniſm, or animal electricity, 433-448; Wilkinſon's application of to medical purpoſes, 447; in ſuſpended animation, 448.
Galvanometer or galvaniſcope, 440, 445.
Gilbert, Dr. his early diſcoveries, 407.
Grey, Mr. diſcovers the difference between conductors and non-conductors, &c. 407, 408.
Gymnotus electricus, the electrical eel, 433.
Hauch's balance electrometer, 415; experiments of his, 431.
Hawkſbee's improvements of electricity, 407.
Henley's experiments on conducting ſubſtances, 409; his luminous conductor, 410; his quadrant electrometer, 414.
Inſulation explained, 424.
Kite, electrical, 413.
Lane's electrometer, 410, 414.
Lawſon's diſcharging electrometer, 416.
Leyden phial diſcovered, 408; deſcribed, 411; Monnier's and Franklin's diſcoveries, 412; Cavallo's experiments, 413; other experiments, 430, 431.
Lightning identical with electricity, 431; how to ſecure buildings from, 431, 432.
Ludolf, firſt ſets fire to inflammable ſubſtances by electricity, 408.
Machines, electrical, 410; the grand Teylerian machine at Haerlem, 411.
Magnetiſm and animal magnetiſm, 434.
Medical electricity, 409; galvanic, 445-447.
Metals, deflagration of, 436; oxydation, 440; plates of, for galvanic experiments, 444; to ſtrike their oxyds upon paper, 445.
Newton, ſir Iſaac, diſcovers that electric attraction and repulſion penetrates glaſs, 407; left the diſcovery imperfect, 425.
Nerves, arming or coating of, for galvanic experiments, 440.
Nicholſon and Carliſle's galvanic experiments, 435.
Points, action of, 409, 426, 427; not perfectly underſtood by Franklin, 427; accounted for by Cavendiſh, 428.
Poles of electricity, 426.
Prieſtley's diſcoveries, 408; his machine, 410.
Returning ſtroke, firſt diſcovered by earl Stanhope, 432.
Richman, profeſſor, killed by lightning from his own electrical battery, 431.
Rubber of the machine, 410.
Ruſſel's doctrine of the electric fluid, 423.
Shock, electrical, 408, 431; to communicate to any part of the body, 411; its force, 430.
Single electric fluid demonſtrated, 430.
Spark, electrical, its effects, 425.
Silver and zinc, the beſt galvanic combination, 440; ſilver how diſcoloured by eating eggs, 442.
Torpedo, its electrical properties, 433.
Volta, his electrophorus, 419; his condenſer, 421; demonſtrates that electricity and galvaniſm are the ſame, 434; his apparatus and galvanic experiments, 434, 435, 436; on a ſeries of metals, 443; his moto-electrical apparatus, 444.
Wall, Dr. obſerves the ſimilarity between electricity and lightning, 407.
Water, decompoſition of, by the voltaic pile, 435; by common electricity, 436; Dr. Wollaſton's method, 444; water, or other fluid, in galvanic experiments, acts not as a conductor, but by oxydating the metal, 443.
Watſon and Franklin make a ſimilar diſcovery, 408; his experiments on the Leyden phial, 411.
Wollaſton on the identity of the galvanic and electric fluids, 436.

ENGLAND.

ABERCROMBY, Gen. commands the Bombay army againſt Tippoo Saib, 776; ſerves in the Helder expedition, 792; killed in Egypt, 337, 795.
Addington, Henry, made ſpeaker of the houſe of commons, 773; prime miniſter, 793; retires with honour, 796.
Adrian builds a wall from the Eden to the Tyne, 541.
Agincourt, battle of, 609.
Agitators, a ſort of armed parliament, 676.
Agricola, his proceedings in Britain, 540.
Aix-la-Chapelle, treaty of, 720.
Alban's (St.) battle of, 616; ſecond battle of, 617.

Aleftus, his ſhort reign, and death, 542.
Alfred, his glorious reign, 549; death and character, 551; firſt divided England into ſhires and counties, 797.
America, North, operations there againſt the French, 721; Louiſbourgh and fort Du Queſne taken, 724; forts Niagara, Crown point, and Ticonderago; Quebec, and all Canada, 725; ſtamp-act paſſed, and repealed, 737; duties on tea, 738, 741, 746; aſſiſted by the French, 747; independence acknowledged, 770.
Amiens, peace of, 795.
Anne of Cleves, Henry VIII.'s fourth wife, 639; divorced, 640.
Anne, queen, ſecond daughter of James II. married to prince George of Denmark, 691; ſucceeds William III. on the throne of England, 701; declares war againſt France, 702; ſupports Charles againſt Philip king of Spain, 704; unites the parliament of Scotland with that of England, 705; adopts a tory miniſtry, and diſplaces the duke of Marlborough, 707; peace of Utrecht, 708; death of Anne, 709.
Anſelm, archbiſhop of Canterbury, 564, 566.
Anſon, commodore, commands a ſquadron againſt the Spaniards, 714; his ſucceſs, 715.
Antoninus's wall from the Forth to the Clyde, 541.
Argyle, earl of, condemned in the reign of Charles II. 689; duke of, joins in Monmouth's rebellion againſt James II. which coſts him his life, 691.
Armada, preparations for, 658; defeated, 659.
Army, ſtanding, under Charles II. 684; declared illegal, 688; vote of the commons for diſbanding, 700; how governed at preſent, 801.
Arteveld, a brewer of Ghent, 597.
Arthur, prince of the Silures, 545.
Arthur, nephew to king John, is murdered by him, 578.
Arthur, ſon of Henry VII. marries Catharine of Arragon, and dies ſoon after, 630.
Athelſtan, king of England, 552.
Atterbury, biſhop of Rocheſter, baniſhed for favouring the pretender, 713.
Aughrim, battle of, decides the fate of Ireland, 698.
Auguſtine, St. ſent by pope Gregory to reſtore Chriſtianity in Britain, 546; his great ſucceſs, 547.
Babington's conſpiracy, 655.
Bacon, lord Verulam, 665.
Baliol, John, king of Scotland, 588; his baniſhment, and death, 589.
Bank ſtops paying caſh, 787.
Bannockburn, battle of, 593.
Barnet, battle of, 620.
Barton, Elizabeth, an impoſtor, 638.
Becket, a very troubleſome prieſt, 571; protects a murderer, 571; is himſelf murdered, 572; Henry II. does penance at his tomb, 574.

70. EPHEMERA, EPIDENDRUM, and ERODIUS 867
71. EQUUS. The Zebra - - - 890
72. ERINACEUS. The Hedgehog - - 902

The PORTRAITS of the SOVEREIGNS of ENGLAND which illustrate this Volume, are copied from DACIER's invaluable MEDALS, in the extensive collection of Mr. Tassie of Leicester Square. The correctness of contour, and *costume en militaire*, which distinguish these medals, may be satisfactorily inferred from the high estimation in which they are held, as well as from the genuine sources from which they were taken,—namely, THE COINS AND MEDALS STRUCK BY AUTHORITY OF THE PRINCES THEMSELVES.

The leaf in this Volume containing pages 227 and 228, and in which the article ECHINORYNCHUS is omitted, must be cancelled, and the annexed leaf, comprising that article, substituted in its place.

☞ The Editors will esteem themselves particularly obliged to M. M. who kindly made an offer of assistance in compiling "An Historical and Analytical Treatise on LAW, including NATURAL, CIVIL, and COMMON LAW," if he will favour them with his address.

J. ADLARD, Printer,
Duke-street, Smithfield.
